THE IRON AGE

THURSDAY, OCTOBER 12, 1893.

The Bristol Recording Voltmeter for Alternating and Direct Current.

For some time there has been a demand in electric light and power stations for a voltmeter which would make a continuous record day and night of all changes of voltage. It has been shown by tests that the life and efficiency of incandescent lamps are greatest when the voltage is evenly maintained. When it rises above that for which the lamps were designed, even though the lamps may not be burnt out, they are liable to be seriously injured. If voltage falls below the normal, the result is deficient illumination and dissatisfaction of consumer.

In the accompanying engravings we illustrate a new recording voltmeter which is being manufactured by the Bristols' Mfg. Company of Waterbury, Conn. This instrument has been designed with a special view to being fundamentally simple in construction, extremely sensitive and accurate in its operation.

Fig. 1 represents the voltmeter ready for connection. Fig. 2 shows the interior construction. The coil A is mounted on the spring knife edge supports D and E, and is free to move toward the parallel and stationary coil B when they are mutually attracted to each other by a current passing in series. The current is conducted to the movable coil A through the supporting springs D and E, and this, together with the special feature of the moving coil being mounted on frictionless spring knife edges, renders the instrument extremely sensitive to the smallest changes of voltage. The marking arm F is attached directly to the spring E, and partakes of its motion, recording the changes of voltage on a uniformly revolving chart. It will be observed that the instrument is constructed on the electric balance principle without permanent magnets.

The divisions on the chart are on an increased scale in the vicinity of the voltage to be maintained, thereby making it possible to note the variation of one volt. The chart shown in Fig. 1 is intended for a 110-volt circuit, but the instrument is equally well adapted to any other desired range of voltage, as, for instance, one of 600 volts for electric railway work. The coil C is an auxiliary resistance. With the alternating current voltmeter the auxiliary resistance is furnished in a separate rheostat, which may be adjusted to suit the rate of alternations of the current to be measured. Several of these voltmeters have been in use in large electric light stations for the past three months, and are giving the highest satisfaction. At the World's Columbian Exhibition the company have one of the instruments in operation at their exhibit in Machinery Hall and one in Electricity Building. Two of the voltmeters are being used by the Committee on Awards in connection with the life tests of incandescent lamps.

THE BRISTOL RECORDING VOLTMETER FOR ALTERNATING AND DIRECT CURRENTS.

Combustion at the Tuyere Level.

W. Van Vloten has discussed in *Stahl und Eisen* the way in which the combustion proceeds immediately in front of the tuyeres in a blast furnace. Many points, he observes, are in doubt. For instance, it is not known how far the oxygen of the blast penetrates into the furnace, whether the carbon of the fuel is at once completely converted into carbonic anhydride, or whether it is carbonic oxide that is produced. Then, again, the influence exerted by the different temperatures of blast and by varying conditions in the nature of the fuel are still matters of doubt. With a view to elucidate this question, the author withdrew, by means of a cooled copper tube, portions of the gas both from the immediate vicinity of the tuyere nozzle and from various parts of the crucible portion of the furnace, both above and between the tuyeres. A drawing of the fusion zone of the furnace in which these tests were made accompanies the description. Most of the tests were made during the normal working of the furnace, which ran on basic Bessemer iron, the furnace having a daily out turn of about 130 tons. For every 1000 parts of pig iron made there was charged on an average 929 to 940 parts of coke, containing 9 5 to 10 per cent. of ash, 600 parts of bull-dog and scale, 1780 parts of ore and 620 parts of flux. The blast was blown at a pressure of 5 pounds through five

146055
Hosted by Google

tuyeres 4.72 inches wide in the clear, and at a temperature of from 650° to 750° C. Some of the tests were made when a gray basic Bessemer pig iron was being made which contained 2 per cent. of silicon. Of this metal the furnace made 100 tons a day, with a coke consumption of 20 hundredweight per ton of pig iron made. The tuyeres were in this case 4.32 inches wide; otherwise the conditions were identical with those referred to above. Some other tests were made when the furnace was running on a white iron containing 5 per cent. of manganese. The results of the analyses are tabulated by the author, and they show that while the combustion is very intense it is confined within a very small space. Despite the fact that the blast on entering the furnace had a velocity of 820 feet per second, the maximum distance from the tuyeres at which oxygen could be detected was only 2 feet. Various tests made at a distance of 24.8 inches above the tuyeres in no case showed any free oxygen. The results further showed that even when using blast of a very high temperature the oxygen of the blast was first converted into carbonic anhydride before any carbonic oxide was formed. Oxygen and carbonic oxide together were only found in 3 of the 46 experiments, the results of which are tabulated, and even then only in very small quantities. It is otherwise with hydrogen, the presence of which was observed in every instance, even when much free oxygen was also present. The ratio observed between oxygen and nitrogen was never identical with that existing between these gases in air, the oxygen being always present in smaller quantity, due, no doubt, to the oxidation before the tuyeres of elements other than carbon—such, for instance, as silicon, manganese, iron and phosphorus. Indeed, it may be considered that in the crucible portion of the blast furnace there is an oxidizing zone immediately in front of the tuyeres and a reducing zone directly above this oxidizing one. The author further shows that the sinking of the charge in the blast furnace is probably a very irregular movement, and to this he attributes the hanging of charges.

California Midwinter International Exposition.

The Department of Publicity and Promotion of the California Midwinter International Exposition issue, from the California State Building, World's Fair, Chicago, a circular letter in regard to the exposition to be opened in San Francisco, Cal., on January 1, and to which we referred last week. The directors of the California enterprise believe that its success is assured, and that there is no doubt of a large attendance of visitors from foreign countries and the American States other than those bordering on the Pacific Coast, judging from the interest taken by World's Fair visitors in the proposed undertaking. The railroad companies have promised to make a one-fare rate for the round trip, thus bringing the cost of a visit to the Golden Gate within reasonable reach of many who could not otherwise hope to get so far afield. In reference to the plan and scope of the exhibition, the managers observe that although the California Fair will not be as great in size as the Columbian Exposition it will be thoroughly international in character, and will show all that is best in the art, science and industry of the world. Some of the best and most interesting exhibits in each department of the World's Fair will be removed from Chicago to San Francisco at its termination, in addition to which many novel and original displays will be made. A Midway Plaisance is to be as prominent a feature of the fair as that of Chicago, and many of the best displays from that place will go on to San Francisco, while a number of novelties are to be introduced. Foreign countries have been invited to co-operate through their commissioners, and we understand are entering heartily into the scheme.

The Foundrymen's Association.

The regular monthly meeting of the Foundrymen's Association was held at the Manufacturers' Club, Philadelphia, on Wednesday, October 4. The chair was occupied by Thos. Devlin of Thos. Devlin & Co., Philadelphia. In the absence of the secretary, Howard Evans, the duties of that official devolved upon H. C. Vansant of Morris, Tasker & Co., Incorporated, Philadelphia. The minutes of the last meeting were read and approved. The Executive Committee made no report, as there had been no meeting of that body since the last meeting of the association.

Mr. Vansant read a letter received from Professor MacAlister of the Drexel Institute, Philadelphia, in regard to the arrangement for chemists' services discussed at the last meeting, in which was expressed a belief that arrangements could be made at the institute for the making of determinations on satisfactory terms.

Mr. Vansant also read a letter from Congressman Bingham, acknowledging receipt of a copy of the resolution passed by the association at its July meeting, and stating that he was in full accord with the policy therein expressed in regard to the repeal of the silver purchasing clause of the Sherman act.

L. B. Whitney of A. Whitney & Sons, Philadelphia, representing the car wheel section of the Price Committee, reported that prices were never lower than at present.

There were no reports from the remaining sections of the committee.

Stanley G. Flagg, Jr., of Stanley G. Flagg & Co., Philadelphia, reported that he had had an interview with Professor Spangler of the Mechanical Engineering Department of the University of Pennsylvania, at which the professor stated that, in response to a letter he had received from the secretary of the association, he had taken up with Professor Smith the question of undertaking analytical tests for the members of the association. Professor Smith said that the university would be only too glad to aid the association in any way possible, but at present their laboratories were full, and if an additional force was required extra expense would be incurred. Professor Spangler intimated that, in the event of the work being done at the university, no profit would be expected; but charges, simply sufficient to cover expenses, would be made, and that the association should guarantee the expenses of the work, to the extent of say $650 per year, of which amount $500 would be applied in payment for the services of a man who would be at the disposal of the association at all times, and the remaining $150 would be used for incidental expenses. It was estimated that the entire expense would amount to about $650. He (Mr. Flagg) told Professor Spangler that the association was not yet ready to act in the matter, but that he would report the suggestion to this meeting. As far as mechanical tests were concerned Professor Spangler said that if samples were sent to his department he would willingly make any test required, free of any charge whatever, and that he should consider such calls upon his department favors to himself. The employment of a man especially for the work of making tests was, the professor thought, rendered necessary by the fact that, when samples were sent to the department for analysis, analyses would be required the same day as sent; and in case all the young men in the department were employed on other analytical work, which could not be left, the service would be unsatisfactory. By employing a man exclusively for the work tests could be made promptly. Professor Smith had hoped to be present at this meeting to discuss the matter, but another engagement prevented his attendance.

Upon motion it was resolved that personal invitations be sent to Professors Smith, Spangler and MacAlister to be present at the next meeting of the association for the purpose of further discussing the matter.

Mr. Vansant read a letter from the secretary of the Western Foundrymen's Association, dated September 25, stating that at a meeting of that association held the previous Wednesday it had been decided that if possible and advisable their October meeting would be held in the rooms of the Associated Engineering Societies in the Mining Building at the World's Fair, in which case an effort would be made to have the day of the meeting recognized as an official "Foundrymen's Day" by the exposition, and to have the Mining Building open in the evening; that arrangements would also be made to have one or two important papers read; that invitations would be sent very widely throughout the West, and the Philadelphia organization would be invited to attend, and asking how many founders from the Philadelphia district would attend, and for suggestions regarding the plan.

As Mr. Evans, the secretary of the association, was in Chicago, a motion was made that the matter be referred to him with instructions to do what in his judgment he considered best in the interests of the asssociation; and that Mr. Whitney be directed to write to Mr. Evans informing him of this arrangement.

Dr. Edward Kirk then delivered the following address on "Fluxing:"

Fluxes.

Fluxes is the name or term applied to a substance which imparts igneous fluidity to metals when in a molten state, and has the power to separate metals contained in metallic ores from the non-metallic substance with which they are found in combination, and also to separate from metals, when in a fluid state, any impurities they may contain. Fluxes are also used for the purpose of making a fluid slag in furnaces to absorb the non-metallic residue from metals or ores and ash of the fuel and removing them from the furnace to prevent clogging and keep the furnace in good working order. The materials used as fluxes for the various metals consist of mineral, metallic and chemical substances found suitable for separating metals from their ores and cleansing them of impurities, and are numerous and varied in nature and composition. But this evening we shall only consider those employed in

Hosted by Google

the production of iron and the melting of iron for foundry work. The mineral substances employed for this purpose are numerous, but they consist principally of the carbonate of lime in its various forms, the principal one of which is limestone.

Foundrymen long ago conceived the idea of using limestone as a cupola flux. In many foundries it is the practice to use a few shovels or a few riddles of finely broken limestone in the cupola on the last charge of iron, or distributed through the heat a few handfuls to each charge of iron. The object in using limestone in this way is not to produce a slag to be drawn from the cupola, but to make a clean dump and a brittle slag or cinder in the cupola that can be easily broken down and chipped from the lining when making up a cupola for a heat. Limestone used in this way does not produce a sufficient quantity of slag to absorb the dirt from the iron and ash of the fuel and keep the cupola open and working free, but rather tends to cause bridging and to reduce the melting capacity of the cupola. The making of a brittle cinder in a cupola by the use of limestone depends to a great extent upon the quality of the stone. The results obtained from the use of limestone in small quantities in a cupola are so uncertain that I do not think they justify a foundryman in using it.

The tendency of slag or cinder in a cupola is to chill and adhere to the lining just over the tuyeres and prevent the proper working of the furnace. So great is this tendency to bridge that a small cupola will not melt properly for more than two hours and a large one for more than three hours. To overcome this tendency to clog and bridge foundry men in many cases have adopted the blast furnace plan of using a large percentage of limestone as a flux in their cupolas and tapping slag.

When a large percentage of limestone is charged it forms a fluid slag. This slag settles through the stock to the bottom of the cupola, and in its descent absorbs the ash of the fuel and dirt or sand from the iron and carries them to the bottom of the cupola, where the slag and dirt it contains may be drawn off and the cupola kept in good melting order and in blast for days at a time.

The amount of limestone required per ton of iron to produce a fluid slag depends upon the quality of the stone, the ash of the fuel and the condition of the iron to be melted. It is the custom in some foundries where the sprues and gates amount to from 30 to 40 per cent. of the heat to melt them without milling to remove the sand, and to use enough limestone in the cupola to produce a sufficient quantity of slag to absorb and carry out of the cupola the sand adhering to them. In this case a larger percentage of limestone is required than would be required if the sprues and gates were milled and only clean iron melted. Poor fuel also requires a greater amount of slag to absorb the ash than good fuel, and a lean limestone must be used in larger quantities than a stone rich in lime. The quantity required to produce a fluid slag amounts to from 25 to 100 pounds per ton of iron melted. The weight of slag drawn from a cupola when the sprues and gates are not milled and the cupola is kept in blast for a number of hours is about one-third greater than the weight of limestone used. When the sprues and gates are milled the weight of the slag is about equal to the weight of the limestone. When the cupola is only run for a short time and slag only drawn during the latter part of a heat the weight of slag is less than the weight of the limestone. The slag drawn from a cupola has been found by chemical analysis to contain from 4 to 7 per cent. of combined iron and numerous small particles of shot iron mechanically locked up in the slag, which cannot be recovered except at a greater cost than the value of the iron. In a number of tests made in the same cupola to ascertain the percentage of iron lost in melting when the cupola was slagged and when it was not slagged, I found the loss of iron to be from 3 to 4 per cent. greater when the cupola was slagged.

Effect of Flux Upon Iron.—Many of the limestones and other mineral substances employed as cupola fluxes contain more or less finely divided oxides, silicates, &c., in combination with earthy materials. The conjoined effect upon iron of these diffused impurities in a cupola is to prevent the metal from running clean in the mold or making sharp, sound castings, and the tensile and transverse strength is frequently impaired by them. The tendency of the cupola furnace is to clog and bridge over the tuyeres, and concentrate the blast upon the iron through a small opening in the center and injure its quality. If by the free use of limestone we prevent bridging and keep the furnace working open and free we avoid injuring the iron in melting by the concentration of a strong blast upon it. The effect, therefore, of limestone in a cupola is not to improve the quality of iron, but to prevent its deterioration in melting.

The Action of Fluxes on Linings — Limestone and other minerals employed as fluxes frequently contain impurities which enter into combination with the lining material of a furnace and render it fusible. This fact was fully illustrated at the foundry of John D. Johnson & Co., Hainesport, N. J., a few weeks ago. The cupola front had been put in with new molding sand for a long time and no flux used in the cupola. The sand made an excellent front that resisted the action of the heat and molten iron upon it. As the heats enlarged it became necessary to use flux and top slag to run off the heat. Oyster shells were used and produced a slag that flowed freely from the slag hole and had no effect upon the sand in the front. When the supply of shells became exhausted a limestone was used in place of them. Trouble then began with the front. It was melted by the flux into a thick tough slag that settled down and closed up the tap hole, and the iron could only be drawn by cutting away a large portion of the front to enlarge the tap hole. Mr. Johnson called at my office to learn what could be done to keep the tap hole open. I advised that the front material be changed and a mixture of fire clay and sharp sand be used instead of molding sand. This was done and there was no further trouble in keeping the tap hole open and in good order to run off the heat. This serves to illustrate the effect of fluxes upon lining material.

From the various qualities of cupola brick and lining material now in the market a lining may be selected that will resist the action of almost any flux or slag, and foundrymen may select a flux to suit the lining or a lining to suit the flux, whichever they find it to be the most profitable in their locality.

How to Slag a Cupola.—Foundrymen sometimes experience trouble in slagging their cupolas. This is largely due to lack of knowledge in charging the limestone and drawing the slag, for any cupola can be slagged if properly worked. To draw slag from a cupola a sufficient quantity of limestone or other slag producing material must be charged in the cupola with the iron to make a fluid slag. The exact amount required can only be learned by experimenting with the fluxing material used, but is generally from 50 to 60 pounds of good limestone per ton of iron when the remelt is not milled. The limestone is generally charged on top of the iron, and is put in with each charge after the melter begins using it. No limestone is used with the iron on the bed or first few charges of iron. In small cupolas limestone is generally charged with the second or third charge of iron. In large cupolas, when the charges of iron are light, six or eight charges, or generally about one-sixth of the heat, are charged without limestone. This is the way limestone is used when the cupola is run in the ordinary way for a few hours. When the cupola is run for some special work the limestone is charged in a number of different ways.

The slag is drawn from the cupola through an opening known as the slag hole. This opening is made through the casing and lining under the lower level of the tuyeres, and at a point in the cupola where it will be out of the way in removing iron from the spout and convenient for removing the slag. The hight the slag hole is placed above the sand bottom depends upon how the iron is drawn from the cupola. When it is desired to hold iron in a cupola until a sufficient quantity is melted to fill a large ladle the slag hole is placed high, and when the iron is drawn as fast as melted the slag hole is placed low.

When a slag hole is placed high slag can only be drawn as the cupola fills up with iron and raises it to the slag hole. When the iron is withdrawn from the cupola the slag falls, and the slag hole is closed with a bod to prevent the escape of the blast.

When the iron is withdrawn from a cupola as fast as melted the slag hole is placed low, and when opened it is permitted to remain open through the remainder of the heat. This is the best way of drawing slag from a cupola, for the flow of the slag is regulated by the amount of slag in the cupola, and if the hole is not made too large there is no escape of blast. The slag in the bottom of a cupola takes up impurities from the fuel and iron, and if permitted to remain in the cupola for too long a time it may become so thick that it will not flow from the slag hole; or it may be filled with impurities, become overheated, boil up and fill the tuyeres with slag, and when boiling it will not flow from the cupola through a small slag hole. The time for drawing slag from a cupola is, therefore, a matter of great importance. The slag hole is generally opened in from half an hour to an hour after the cupola begins to melt, and when placed low is permitted to remain open through the remainder of the heat. When placed so high that slag can only be drawn when the cupola fills up with molten iron it should be opened as soon as the slag begins to rise and closed as soon as it falls below the opening.

Does it Pay to Slag a Cupola?—Nothing is gained by slagging a cupola when the sprues and gates are milled and the heat can be melted successfully in the cupola without slagging. But a great saving in labor and wear and tear of machinery can be effected in many foundries by melting

Hosted by Google

the sprues and gates with the sand on, and slagging the cupola to carry the sand out and keep the cupola working free. A cupola cannot be made to melt iron faster by slagging than it can without slagging, but it can be kept in blast and in good melting condition for a greater length of time and a much larger amount of iron melted by slagging. Foundrymen who find their cupolas temporarily too small to melt the quantity of iron required for their work can overcome the difficulty by slagging the cupola and keeping it in blast for a greater length of time. In endeavoring to make an estimate of the cost of slagging a cupola I found that the cost of limestone in different localities varied from 50 cents to $3 per ton. The amount used varied from 25 to 100 pounds per ton of iron melted. The amount of slag drawn varied from 25 to 100 pounds of iron. The iron combined with the slag varied from 4 to 7 per cent. With the wide differences in the cost and quality of limestone used and the difference in the quantity of slag drawn and percentage of iron it contained, I found it impossible to make an estimate that would be of any practical value to foundrymen. Such an estimate must be made at each foundry to be of any practical value.

Oyster, clam and other shells are frequently used as a flux in place of limestone in localities where they can be procured at a less cost than limestone. The shells are charged in the same way as limestone and in about the same proportions to the iron. They may be used in place of limestone, either in large or small quantities, and have about the same effect upon the iron and cupola as limestone. When used in large quantities they produce a fluid slag that keeps the cupola working free and flows freely from the slag hole, carrying with it the refuse of melting that clogs a cupola.

Marble is another of the carbonates of lime and the spalls or chippings from marble quarries or works are quite extensively used in some localities as a cupola flux.

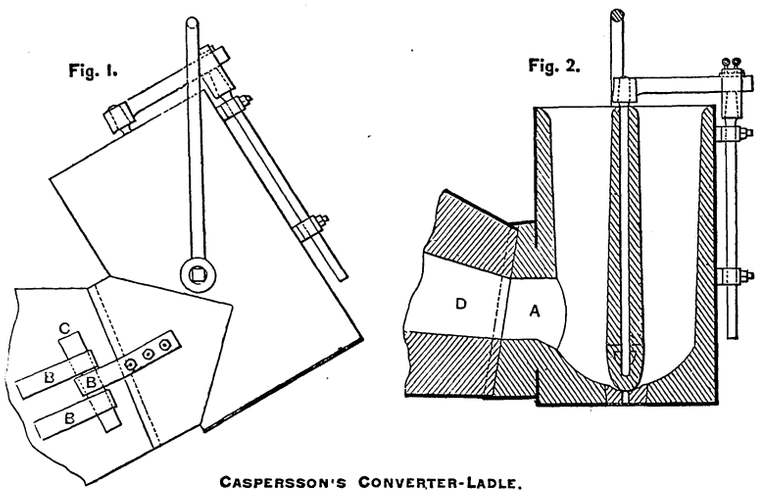
There are a number of other minerals such as fluorspar, feldspar, quartz rock and numerous chemical compounds that are used as cupola fluxes, but I will leave these for consideration at some future time.

Upon the conclusion of his address Dr. Kirk was tendered a vote of thanks. Asked whether there was any difference in the amount of fuel required, Dr. Kirk stated that there was no practical difference. The amount of fuel used in a cupola was very uncertain, and it was a hard matter to determine whether more was required or not.

P. D. Wanner of the Mellert Foundry & Machine Company of Reading, Pa., then addressed the meeting at length upon the present condition of the trade and the wages question. In the course of his remarks he said it was well known that for a period of five years, or since 1887, as far as the cast iron pipe trade was concerned, and probably the foundry business generally, there had been a depression, and during these years losses and lack of profits had been suffered by the manufacturers. Every cut on prices had been met until there was nothing left to cut on, but the price of labor had remained the same. Labor had not suffered until within the last four or five months. During the recent financial stringency and panic there had been a reduction in labor at a great many places all over the country. Employers, as a rule, he said, found it a most unpleasant proceeding to reduce wages. It was the feeling he had and it seemed to be shared by all with whom he had spoken on the subject. It was unpleasant to the employer as an individual and disagreeable to the community. Everybody talked about it and sought to hold up the employer as an example of tyranny and an oppressor of the poor, and so forth. But, he said, when times such as experienced during the last few months were met a great many employers had been compelled to reduce wages and the working people had had to submit, and did so cheerfully. Now, after all, it seemed to him a question whether it was good policy to reduce wages or whether there had been a real necessity for it. Unless the reduction was considered necessary in order to prevent importation or competition with foreign labor he doubted very much the policy or necessity of it. He believed that if overproduction was the cause of depression in business it was not good policy to reduce wages, and that it was not the remedy to apply. It would be better to shut down those particular branches of trade where overproduction was present, and let the working people find other avenues of employment. Wages, he was inclined to believe, should be maintained to the last, and he did not think the necessity had arisen for a reduction of wages in this country. After reference to the tariff question, in which he attributed the overstimulation of business to a high tariff, he said in conclusion, that the higher wages could be kept the more prosperous the country would become.

A general discussion followed. The chairman doubted whether if an advantage was gained by a reduction in wages, such advantage would not be given to the customer.

Mr. Whitney thought prices were regulated by the ratio of supply and demand. The chairman said the position of supply and demand was claimed to be an old doctrine, and in Pennsylvania the idea was scouted altogether. As Mr. Wanner had said, he could not see any reason for manufacturers cutting wages to compete with one another. That is what it would amount to, and if an advantage was obtained it would be given to the customer.



The trend of the discussion was toward a possible arrangement for a uniform scale of wages in the foundry business, and finally, on motion, the matter was referred to the standing committee.

The meeting then adjourned.

The Bessemer Process as Conducted in Sweden.—III.*

BY PROF. RICHARD AKERMAN, STOCKHOLM, SWEDEN.

Besides the actual waste given above, there was, down to 1880, a loss of 2 or more per cent., due to the formation of ladle skulls; but this trouble was luckily obviated by Caspersson's converter ladle,† so-called, which, since the date mentioned, has been used with the greatest success at the majority of the Swedish Bessemer works. This arrangement, illustrated in Figs. 1 and 2, consists of a narrow ladle, which is furnished low down on the side with a lateral opening A, that fits the mouth of the converter D. Immediately after the blow the ladle is brought up to the converter mouth and made fast by means of wedges, C, in the lugs B (see Fig. 1). The converter is then turned down still further, so that its position is as indicated in Fig. 2, and a part of the bath of metal runs into the converter ladle, while most of the metal remains in the converter. It is precisely on this circumstance, coupled with the smaller depth of bath occasioned thereby, that the advantages of the converter ladle depend. A ladle, being never as hot as a converter at the end of a blow, operates, therefore, always to chill; but as the converter ladle is quite small, its power to chill the metal bath, the incomparably larger part of which remains in the converter after it has been turned down, is far less than that of an ordinary ladle, which receives all of the molten mass.

CASPERSSON'S CONVERTER-LADLE.

The result is that the liquid Bessemer metal can be allowed to remain in peace and quiet longer, to permit the gases to escape, and without fear of partial freezing before being tapped into the molds, than before the advent of the converter ladle; at least, longer than was possible with a product only as moderately hot as the Swedish Bessemer metal generally is, especially since the quantity handled in Sweden at each blow, as has been shown, is comparatively very small, and consequently the cooling effect of the ladle

* Read before the American Institute of Mining Engineers. Translated by Philip W. Moen and Emanuel Trotz, Worcester, Mass. Chicago meeting, being part of the International Engineering Congress, August, 1893.

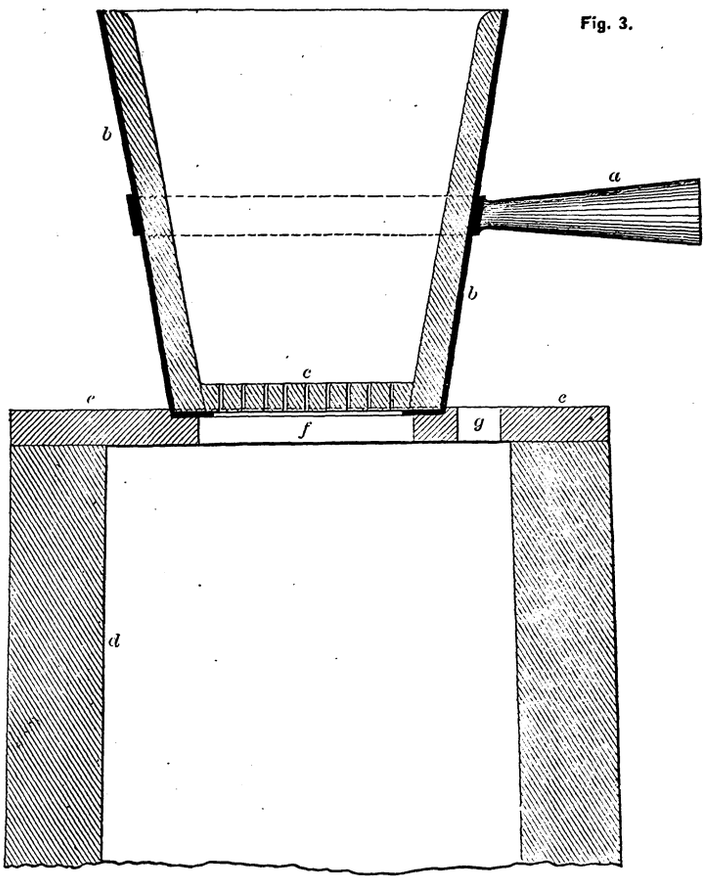
Hosted by Google

is proportionally great. By the aid of the converter ladle, ladle skulls, formerly so common here, can be prevented. But to this great advantage may be added another—viz.: That the product is somewhat freer from blow holes, partly because with the converter ladle a longer time is given for the escape of the gases and for the more complete separation of the slag by rising to the surface, and partly on account of the more moderate speed of the stream of metal incident to the smaller depth of bath.

Since the converter ladle, during teeming, is fast and immovably fixed to the converter, it is evident that the former cannot, like an ordinary crane ladle, be carried over the molds, but that the molds must be brought under the converter, either on cars or on a turntable.

As has been mentioned already, the formation of blow holes in ingots stands in the most intimate connection with the temperature that prevails during the blow. If the temperature has been too high, as when temperature No. 2 instead of No. 1 has been employed, and there is reason to fear surface blow holes in the ingots, this serious detriment can be somewhat lessened only by allowing the product so to cool before being tapped that it then has the same heat as that which ordinarily prevails with temperature No. 1. If this is to be attained only by letting the metal stand longer in the ladle before being tapped into the molds, there is danger with use of ladle skulls, and sometimes even of the partial closing up of the nozzle, together with the spurting stream occasioned thereby; and this, in turn, gives ugly and faulty ingots. The danger of these disadvantages is certainly very decidedly diminished by the converter ladle; but even with its assistance one cannot always make use with safety of as warm a blow as would be desirable for the complete prevention of red shortness. To meet this difficulty Mr. Caspersson has complemented his converter ladle with a so-called strainer funnel, illustrated in Figs. 3 and 4.

Fig. 3.



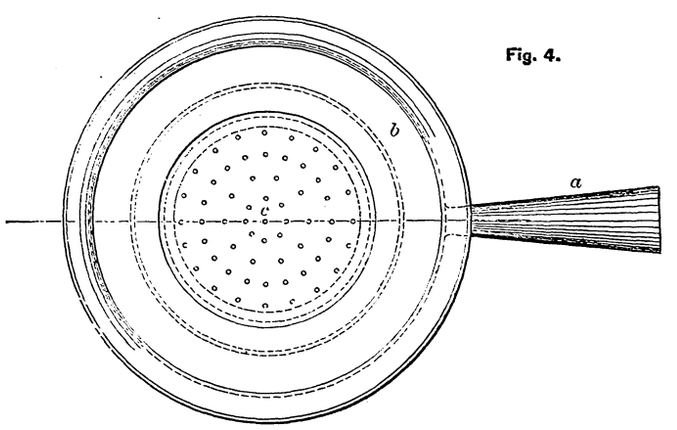


Fig. 4.

CASPERSSON'S STRAINER-FUNNEL.

The plate iron funnel *b*, furnished with the handle *a* and lined with refractory material, has the easily withdrawable chamotte bottom *c*, which is provided with many larger or smaller holes, the number of which is larger in the same degree as their diameter is smaller. When teeming takes place there is first laid upon the mold *d* a cast iron disk, *e*, with an opening in the middle, *f*, corresponding in size to the changeable funnel bottom, and a little side hole, *g*, which affords a chance for the gases separated during teeming to escape, and also for the man who directs the tapping to judge when the molds have been suitably filled. The preheated funnel is placed over the central opening *f*, and the metal, tapped out through the convertor ladle into the strainer funnel, is divided by means of the holes in the bottom into more or less numerous streams of smaller or larger size. This division of the metal occasions during its passing down into the mold both a more complete removal of gases and greater cooling than takes place in the ordinary mode of tapping. The finer the strainer holes, the more effective does its work become. There should be, therefore, at least two different kinds of strainer bottoms at hand, one with larger and the other with smaller holes, and the choice between them can be made according to the temperature of the blow. After an unusually hot blow a bottom with smaller holes is taken; and if the temperature during the blow has been just hot enough no strainer at all is used.

It might be supposed that the division of the metal into many fine streams would be likely to be dangerous by reason of the risk of partial oxidation with accompanying red shortness; but experience shows that this is prevented by the gases which escape from the metal and speedily fill up the mold covered by cap *e*, thus hindering the contact of the streams with the air.

Although too high a temperature produced during the blow can be suitably lowered by means of the converter ladle and the strainer funnel without fear of making scrap, the higher proportion of silicon and manganese in the product incident to an overhot blow cannot be thus remedied. This can be regulated to a certain degree by the practice employed in other countries of adding cold steel scrap during the blow; but the method of Mr. Casperssen in this connection is still more effective—namely, to charge finely crushed rich ore during the blow; for, besides the chilling which the addition of cold ore occasions directly, it causes an indirect cooling through the considerable absorption of heat involved in the reduction of the iron ore.

By a proper use of these aids the blower, if he can judge the temperature accurately enough, can attain surprising uniformity, even in Bessemer products. This is particularly necessary in a country where most of the Bessemer steel made is used for purposes for which crucible steel is usually required elsewhere.

The Swedish plan of not recarburizing to any considerable extent, but of blowing approximately direct, must, of course, be accompanied by difficulties in deciding when the blow should end, which are greater than those attending the usual course of continuing the blow till the metal is fully decarburized and afterward, by means of different additions, recarburizing to the desired hard-

Hosted by Google

ness. No skill is needed to end the blow, if it is to be prolonged till the drop of the flame becomes conspicuously evident. Quite different does the problem become when the blow for the production of steel must be interrupted while the carbon flame is still so copious that changes in its size can scarcely be detected.

In these earlier stages no great assistance can be had from the spectroscope, because it is only when carbon is so reduced that one can take note of the diminishing of the flame that the changes in the spectra first become sufficiently apparent to be a sure guide by which to judge of the degree of hardness. Hence, although the spectra of the Bessemer flame were scientifically examined in Sweden as early as the beginning of the decade commencing in 1860, the spectroscope has never come into general use here for this purpose.

That by which the Swedish Bessemer blower most guides himself during the blow in producing steel of the higher carbons is, in reality, the character of the sparks, and many a Bessemer blower has acquired a marvelous skill in this direction, when the great difficulties are taken into account. Nevertheless, with a view to prevent faulty blows it has become more common in the course of time for the blower to turn down the converter immediately before he considers the right point reached, to convince himself by a hasty hammer test whether the degree of refining has been judged correctly or not, and then to continue the blow for a few seconds. In producing ingot iron, on the contrary, no such tests are required, and one judges, as has been said, by the flame.

As the Swedish Bessemer metal contains, in comparison with that made elsewhere, relatively little of any elements other than iron and carbon, it is natural that in this country the degree of hardness should have been determined by the contents of carbon, more especially since the colorimetric method of carbon determination, worked out by Professor Eggertz, furnished so easy a means for a quick and generally satisfactory determination of the carbon in the Bessemer product. But besides the colorimetric determination of carbon, which is never omitted in Sweden, the product of every blow is subjected to a hammer test, to determine not only the degree of hardness, but also how far the product is free from red shortness.

Discussion.

When the metal is intended for purposes of construction (which is not as common in Sweden as it is elsewhere, since a very considerable part of the Swedish Bessemer product is used for tools and the like) it is, of course, subjected to the usual mechanical tests.

In the discussion J. Hartshorne of Stowe, Pa., said: Unfortunately for myself, I can only speak from personal experience upon one part of Professor Akerman's paper—namely, the effect of the temperature at which the molten metal is cast upon the quality of the finished steel.

In a general way I have, of course, known for a long time that the colder the metal was cast, provided it ran cleanly out of the ladle, the better the ingot would be. It has only been, however, since I have been engaged in the manufacture of soft steel by the basic Bessemer process that the extreme importance of temperature in casting has been forced upon me.

As the grade of steel made becomes softer the range of permissible temperature becomes smaller, and the necessity of keeping within it becomes greater. It is very difficult to convey an idea of temperature when there is no means of measuring it, but a rough scale can be formed from the amount of skull left in the ladle.

At Pottstown, our heats generally weigh 24,000 pounds of steel, and are poured either into four ingots of 6000 pounds or six ingots of 4000 pounds each. The time occupied in casting is from 15 to 22 minutes. We use two sizes of nozzles, one of which is 1 inch in diameter and the other is 1¼ inches. In making ordinary soft steel, containing carbon from 0.10 to 0.15 per cent., phosphorus 0.05 to 0.07 per cent., sulphur about 0.05 per cent., and manganese from 0.30 to 0.40 per cent., there is quite a range of temperature throughout which good results can be obtained. This grade of steel we cast through 1¼-inch nozzles in from 15 to 18 minutes. The results seem to be about the same if the steel, during casting, is somewhat hotter than enough to leave the ladle clear of skull or if it is cold enough to leave a skull of from 600 to 800 pounds. There is, however, enough variation to warrant belief that a temperature which leaves about 200 to 400 pounds of skull in the ladle is the best. Of course, it is understood that the casting is done just as slowly as possible in all instances.

In making very soft steel, however, the permissible range is much less. Such steel will contain 0.07 to 0.10 per cent. of carbon, 0.01 to 0.03 of phosphorus, below 0.04 per cent. of sulphur, and from 0.10 to 0.20 manganese. The softest I have seen was C = 0.09, S = 0.031, P = 0.015, Mn = 0.095. For such steel the 1-inch nozzle is the best, provided it can be kept open and clean. The casting through the 1-inch nozzle takes about 20 minutes. The best results are obtained when there remain from 200 to 500 pounds of skull in the ladle.

There is no trouble in making the above steel in the converter, provided the proper temperature be obtained in casting. It will roll perfectly, without the slightest trace of red shortness. It will go through the mechanical tests to which we submit every heat of steel with perfect success. These tests I have described in my paper, read at the Reading meeting of the institute, October, 1892, and it is not necessary to describe them again. It will be remembered that they are very searching for brittleness, red shortness and general soundness.

On the other hand, if the steel be poured when too hot the blooms and billets will have surface cracks and striations, and will have great tendency to open up and tear in rolling. The ingots when investigated have invariably shown the blow holes in great number very near the surface. It has sometimes happened that an ingot from a heat which has been cast too hot has been taken from the heating furnace and has been allowed to cool off. In such cases the surface of the ingot has been deeply pitted all over, showing that the blow holes open through the outer skin.

The mechanical tests of such heats show precisely the same characteristics. Another peculiarity is that the tests show much more brittle steel than when the casting has been done at the proper temperature. When the casting of this dead soft steel has been skillfully done the tests show an absolutely dead soft, homogeneous and solid metal. The surfaces and edges are without cracks, checks or flaws of any kind, and the fractures are perfectly solid and fibrous (so-called).

If the steel has been cast too hot the bending tests will show cracks at the bends, the surfaces will show hair cracks and striations, the edges will show cracks and flaws, and the ear tests will have many of the indications of red shortness, while the fractures will show an open, porous and "stringy" metal. These characteristics show themselves in the finished product, but to a less marked degree.

I have not yet been able to fully satisfy myself as to all the reasons for such different results being obtained from steel of practically identical composition as shown by the analyses. There is no doubt, however, that the surface blow holes described by Mr. Caspersson play the most important part in causing them. Sometimes, though very rarely, the metal contains too much oxide, but this is very easily recognized by the fractures of the tests. In such cases the undue temperature has evidently been caused by overblowing It is evident, therefore, that the temperature plays a very important part in the manfacture of the softest grades of steel, and that the greatest care must be exercised in controlling it.

The same rule applies in the casting of open-hearth steel, but the permissible range of temperature is greater. This, of course, arises from there being less gas contained in steel made in the furnace. It is also true, however, that when proper care is exercised in manipulation just as good steel can be made in the converter as in the furnace. It is impossible to distinguish our softest steels or to tell by any tests, physical or chemical, by which process they have been made. This is, I think, solely due to the care and skill exercised in regulating the temperature in casting. I must also confess that it is only lately that we have convinced ourselves of this truth and have attained such skill.

Prof. Akerman has ascribed the small tendency to red shortness observed in Swedish steel to the fluidity of the slag. In my opinion it is to the same cause that the basic Bessemer process owes its comparative immunity from the same trouble. In all successful basic blows the slag is at least as thin as molasses on a warm day. This undoubtedly helps to wash the metal free from oxides. To this reason must probably be ascribed the fact that but little if any more manganese is now needed to be added in the basic than in the acid process, in order to prevent red shortness. The natural inference from the use of the after blow would be that more manganese would have to be added in the basic process, since more iron is oxidized. This was indeed generally the case in the early days of the process, as is shown by the remarks of Thomas, Holley and others. Probably, also, the dilution of the oxides by the large amount of lime has its influence in the same direction.

The thin slag is also a factor in causing the low loss reported, since less metal will be retained in it in the form of shot. The basic process has the same advantage as to thin slag, but this is more than offset by its greater bulk, which is two and a half or three times greater than in the acid process.

The Caspersson ladle is no doubt a valuable and even a necessary adjunct to the Swedish works, where the charges are small, comparatively cold irons are used, and the rate of production is slow. Most of its advantages can, how-

Hosted by Google

ever, be obtained by allowing the metal to remain a few minutes in the vessel after the addition of ferromanganese, and by the use of shallow, dish-shaped ladles, such as those in use at Witkowitz and at Edgar Thomson.

The strainer may be a very good thing, but it strikes me that a man must be very sure of his temperature before he tries many experiments with it. I regret that Professor Akerman did not give dimensions of the two sizes of holes.

Copper Coating the Hulls of Vessels By Means of Electricity.

Those familiar with the subject, and therefore well qualified to express judgment, have frequently and emphatically called attention to the necessity for sheathing the hulls of steel vessels with copper in order to obviate the troubles arising from marine growth, both animal and vegetable, on vessels not sheathed with copper. It has been repeatedly pointed out that the cost of docking the vessels in the new navy will amount to many hundreds of thousands of dollars per annum, the cause for the docking being directly due to the fouling of the bottom. All the vessels should be docked twice a year and in some cases three and four times a year, depending upon the waters upon which they are afloat. Therefore any method which will obviate this difficulty should be received with favor. It is estimated by the officials of the Navy Department that the cost of docking, cleaning and painting the cruiser "Chicago" at suitable intervals during a three years' cruise will require the expenditure of nearly $100,000.

Theodore D. Wilson, late chief constructor of the United States Navy, in his report to the Secretary of the Navy writes as follows: "Thousands of dollars have been expended in the testing of protective and anti-fouling paints and compounds with results which give but very little encouragement to further experiments. We are forced to admit that despite the investigation of noted chemists and the deep study of other professional men there has not yet been discovered an efficient sustitute for copper sheathing."

The method of sheathing steel vessels with wood and afterward applying copper to the wood is extremely clumsy. In order to prevent galvanic action taking place, to the injury of the steel, it is essential to first attach a 2-inch wood sheathing to the steel by means of iron bolts, and on this place a second 2-inch sheathing attached by means of copper bolts, and this finally covered with copper sheets.

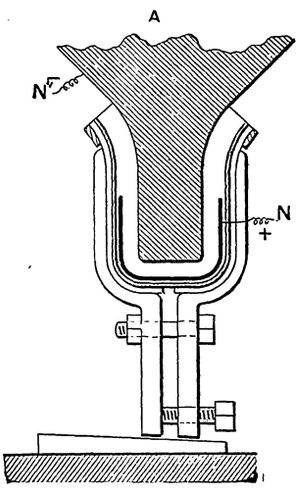

Fig. 2.—Bath for Copper Coating the Keel.

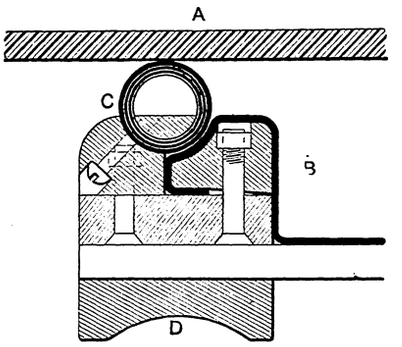

Fig 3.—Section Showing Joint Between Edge of Tank and Hull.

COPPER COATING THE HULLS OF VESSELS BY MEANS OF ELECTRICITY.

It is well known that marine growths take place no matter what the hull of the vessel may be covered with. The advantage of using copper lies in the fact that the growth, instead of being so firmly attached as to require mechanical means for its removal, as in the case of painted and plain hulls, is so weakly adherent that a slight motion of the vessel through the water, or even the ebb and flow of the tide, serves to remove it. Therefore, while a copper coated vessel may under certain conditions of inaction become slightly coated, as soon as the vessel moves through the water this growth falls away. The present Chief of the Bureau of Construction and Repairs in the United States Navy explains this in the following language, referring to copper: "That metal being easily corrodible in sea water, and the resulting verdigris having scarcely any adhesion to its metallic base, falls off with the least possible force, like the wash of the waves or the movement of the vessel through the water, and in falling off carries with it the marine accretions, leaving the metal continuously bright and clean. So continuous is the corrosion of the copper and the falling off of the verdigris that the spores of the marine fauna and flora have no time to develop, and the copper continues clean indefinitely. Experience has shown, however, that the loss of copper from this cause is only 30 per cent. of its thickness in 15 years.

Another vital condition, dependent on the keeping of the hull clean by sending the vessel to dock, is the decrease in speed and consequent increase in coal consumption due directly to the greater power required to drive a hull covered with marine growth through the water. Chief Constructor Philip Hichborn. U. S. Navy, in his report of April, 1889, estimates the resistance of an iron skin as twice that of a smooth copper bottom, increasing to nearly threefold when moderately foul, and to nearly nine times when barnacled, and barnacles and seaweed may collect upon the iron bottom to such an extent as to reduce the speed of the vessel to an almost imperceptible motion.

It is well known that United States vessels in waters far from docking facilities lose sometimes as much as 50 per cent. of their speed efficiency because their hulls cannot be properly cleaned.

Chief Constructor Wilson of the Navy Department, in his argument for copper sheathing, submitted a letter from Commander Philip of the "Ranger," dated June 22, 1892, in which he called attention to the fact that with a clean bottom the ship readily made 7 to 8 knots on 7 tons of coal, while with a foul bottom she only made 6 knots though burning from 12 to 14 tons of coal per day.

We illustrate in a general way a method of copper coating the hulls of steel vessels by means of electricity after patents issued to Thomas S. Crane, and which are controlled by the Ship Copper Plating Company of Newark, N. J. By this method copper is deposited electrically upon the surface of the vessel in successive sections, the joints of the sections being overlapped to unite them. The joints are united so perfectly by the electroplating process that the whole coating of the vessel becomes an unbroken metallic sheet. The plating is done by means of a bath like a rectangular box open at one side and fitted water tight to the skin of the ship.

Fig. 1 shows in side elevation the application of the tanks to be applied to the hull of a vessel; Fig. 2 shows the bath for copper coating the keel, and Fig. 3 a method of forming a water tight joint between the tank and vessel.

In these drawings A is the hull of the vessel, B the baths applied to the side, and N N^1 the electric conductors, C in Fig. 3 being a tubing which forms the water tight joint between the edges of the bath and the side of the ship.

Any form of elastic packing can be used to make the bath water tight where it touches the iron hull of the vessel. The frames of the bath are made flexible, and may thus be bent to suit the curved lines of the ship at various points, and special baths are constructed to embrace the keel, as shown in Fig. 2, and for complex sur-

Hosted by Google

faces like the stern bearing and rudder post. It is very evident that the construction here shown may be modified considerably without departing from the principles underlying the system.

Somewhat extended experiments have shown that the copper can be deposited so as to perfectly cover the hull, and that it will cling with such tenacity to the steel as to make its removal impossible without destroying it. Concerning the rate and cost of depositing copper of suitable thickness by this method, it has been calculated that any number of baths 4 x 10 feet may be operated simultaneously in 70 hours' time with an expenditure of 6½ horse-power for each bath. Upon a vessel 400 feet long 60 baths can be operated at once in three rows on one side, with 390 horse-power; or 120 baths, 60 on each side, can be operated at once with 780 horse power, at a cost per day of $150. It is stated that the whole bottom of a ship drawing 20 feet of water can be plated from the water line down complete in eight or nine days by using 60 baths at once on each side, with 780 horse-power, shifting the baths two or three times. The plated surface of such a vessel would aggregate 24,000 square feet and require 55,500 pounds of copper, which, at 12 cents a pound, would cost $6660.

Banka and Billiton Tin Statistics

The Bureau of Statistics has published tables showing the quantities of tin produced in the Dutch East Indies. From the middle of April, 1891, to the middle of March, 1892, and during the years 1886 to 1891, the production of Banka was as follows:

Tin Production of Banka.

Districts.	Gross tons.
Muntok	260
Djeboes	700
Blinjoe	1,021
Soengeiliat	1,030
Merawang	696
Pairg Kalpinang	892
Soengeisleian	670
Koba	208
Toboali	278
Total 1891-92	5,755
1890-91	6,490
1889-90	5,431
1888-89	3,993
1887-88	5,110
1886-87	4,668
1885-86	4,631

The figures for Billiton are as follows:

Districts.	Gross tons.
Tandjong Pandan	355
Manggar	2,518
Linggrang	1,905
Boeding	1,264
Dindang	342
Total year ending April 30, 1892	6,384
1891	5,842
1890	5,825
1889	4,795
1888	4,713
1887	5,400
1886	4,908
1885	3,759
1884	4,297

In the last year reported the number of hands employed in Banka was 7989, while the number was 8690 in the Billiton mines.

The statement in *The Iron Age* last week that serious distress had not yet become apparent in the Youngstown district is followed this week by news to the effect that the patience of storekeepers, harassed by wholesale merchants in need of funds, has become exhausted. Credit has been stopped and the large body of impecunious unemployed workmen are receiving public support for themselves and families.

World's Fair Awards.

Awards were announced last week by the chairman of the Awards Committee, John Boyd Thacher, in Group 77, Department of Machinery, and Group 114 in Manufactures. The machinery awards were for miscellaneous hand tools, machines and apparatus used in various arts and are as follows:

Illinois—Chicago—Tuerk Brothers, medal making machine, Tuerk's hot blast gas burner, time stamp; United States Mangle and Laundry Machine Company, combined mangle, shirt ironer and collar and cuff ironer; Western Steel Protected Glove Mfg. Company, machine for stapling gloves; McCanna Bros., steam cylinder lubricator or oil pump; F. A. Hardy & Co., automatic lens grinding machine; Crown Pen Company, exhibit of tools and machines in operation for making gold pens; P. J. Daemick and John Tobin, molding machine; Covel Mfg. Company, dish washing machine; George S. Blakeslee company, dish washing machine; Electro-Automatic Appliance Company, automatic engine stop; Exhaust Steam Purifying Company, steam separator; Garris Cochrane Dish Washing Machine Company, Shelbyville, dish washing machine; Acme Machine Company, Moline, dish washing machine.

New York—New York City—Troy Laundry Machinery Company, mangles, washing machines, dampening, folding, drying, tumbling, starching and ironing machines, exhibition of model illustrating the construction of drying closets, &c., Duplex mangle machine, double geared brass washing machine; Clough & McConnell, wire corkscrew machine; American Road Machine Company, steel Champion road grader, Champion rock crusher, road roller; Ashcroft Mfg. Company, pressure and vacuum gauges, Bean's standard die stock and Brown's adjustable pipe tongs, Tabor indicator, continuous recorder; Nathan Mfg. Company, injectors, lubricators, oil cups and attachments; Schaffer & Budenberg, pressure gauges, ammonia gauges for ice and refrigerating machines, tachometers for high speed engines, and steam engine indicator, injectors and exhaust injectors; Sherwood Mg. Company, Buffalo, injectors, oil cups, oil pumps, lubricators, flue scrapers, gauge cocks, grease cups and flue blowers; William S. Doig, Brooklyn, box nailing machines.

Pennsylvania—Philadelphia—R. D. Wood, standard apparatus for the manufacture and use of gas; Riehlé Brothers Testing Machine Company, collection of testing machines; Riehlé Brothers Testing Machine Company, measuring instruments; Tinius Olsen & Co., testing machines and micromoters; H. K. Mulford & Co., tablet, lozenge and camphor presses; Consolidated Mfg. Company, brush making machinery; Wm. Sellers & Co., hydraulic testing machine; Delahanty Dyeing Machine Company, machine for coloring raw stock; Harrisburg Foundry & Machine Works, Harrisburg, steam road rollers; Landis Bros., Waynesboro, cylindrical and cutter grinding machine.

Massachusetts—Boston—Crosby Steam Gauge & Valve Company, stationary, marine and locomotive pop safety valves, feed water regulator and revolution counter, steam engine indicator, single spring gauge, double spring gauge and water line syphon valve, pressure gauge tester; McKay Metallic Fastening Association, wire nail making machine; Faneuil Watch Tool Company, bench lathes and attachments, watch makers' lathes and attachments, staking tools and the rivet patent friction clutch, watchmakers' lathes and attachments. Norton Emery Wheel Company, Worcester, emery wheels, tool room grinding machine, twist drill grinding machine. Northampton Emery Wheel Company, Leeds, emery wheels.

Ohio — Cincinnati — Lunkenheimer Company, fittings and appliances for steam engines and machinery, regrinding valves, gate valves, lubricators and steam whistles; J. H. McGowan, & Co., hydraulic tobacco machine. Springfield—Foos Mfg. Company, machinery for crushing, grinding and pulverizing, safety devices, attrition mill; Webster & Perks Tool Company, aluminum reducing wheel. Reliance Gauge Company, Cleveland, solderless copper floats and safety alarm water column; Hospital Supply Company, Sandusky, hospital laundry machinery; Brass & Iron Works Company, Fostoria, well drilling machinery; Buckeye Iron & Brass Works, Dayton, tobacco cutter.

Connecticut—Bristol's Manufacturing Company, Waterbury, recording gauges for pressure, temperature and electricity; Pratt & Whitney Company, Hartford, Thurston torsion machine and Thurston oil tester; Springfield Emery Wheel Company, Bridgeport, stands, safety device for edge grinders, safe chuck for cup wheels, surface and large shear-blade grinding machine, emery wheel.

Michigan—Detroit—Detroit Lubricating Company, sight feed lubricators, low water alarm, oil cups, glass oil cups, valves and other brass work for engines and machinery; Penberthy Injector Company, injectors.

Missouri—Gus V. Brecht Butcher's Supply Company, St. Louis, general display of butchers' supplies.

Rhode Island—Samuel Moore, Providence, automatic machine for making metal beads.

Canada—G. A. Baron, Sherbrooke, clothes drying outfit and machinery for its manufacture; Lent & Coyne, Ridgetown, Ont., washing machine; James Morrison Brass Mfg. Company, Toronto, brass fittings.

Germany—Malmedie & Co., Dusseldorf, wire working machines, machines for making railroad spikes; imperial German Insurance Office, Berlin, appliances for the protection of workingmen; Loeb & Co., Berlin, appliances for the protection of workingmen.

Great Britain—Cress & Co., Limited, Devizes, Wiltshire, dish washing machines; Davies Bros. & Co, Limited, Wolverhampton, improved galvanized iron plates and the exposition of the method of manufacture; John Moncrieff, Perth, Scotland, water boiler gauge glasses; Sidney Smith & Sons, Nottingham, general exhibit of gauges, valves, fittings, &c.; Waterforce Laundry Machine Company, Limited, London, washing machines.

New South Wales—Robert Austin, Sydney, Austin perfect patent washer.

Russia—Prince Gagasene, St. Petersburg, electrical apparatus to the machine for testing the strength of materials.

Wrought Iron and Thin Metal.

The awards in Group 118, Manufactures, are for wrought iron and thin metal exhibit. They follow:

Illinois — Chicago — The Winslow Brothers Company, large hand forged carriage gate, hammered leaf wrought iron work, iron stairs, railings, newels, duplex electroplating on iron, metal mantels and attachments, elevator in-

Hosted by Google

closures; Northwestern Horse Nail Mfg. Company, horseshoes and nails; F. W. Hainsworth & Son, bedsteads; Architectural Iron Works, iron forgings, lamps, fire screens, candle, gas brackets iron cross for graves.

New York—New York City—Tiffany Glass & Decorating Company, New York, wrought copper lamps, fire screen, wrought silver lamp; Bayor & Schebner, wrought iron art grille, andirons.

Maryland—William Wedekind, Hagerstown, horseshoes and horseshoe tools.

Michigan—E. T. Barnum, Detroit, bank and office railings.

Massachusetts—Putnam Nail Company, Boston, horseshoe nails.

Indiana—The Central Iron & Steel Works, Brazil, open hexagonal turn buckles.

Connecticut—Caperwel Horse Nail Company, Hartford, horseshoe nails.

Pennsylvania — Cartwright Metal Roofing Company, Philadelphia, metal shingle roofing.

Ohio—William Russell, Centi, horseshoes; the Omniform Mfg. Company, New Brunswick, horseshoe and calk.

Italy—B. Zilaffi, Sienna, art metal; Taeddo Forcla, Bologna, art metal; Cav. E. Viarerago, Milano, safety ladder fire escape (model); Costello Prospero, Florence, wrought iron.

Germany—Berlin—Edward Puls, two gratings of rare metal, large gate; Max Boettcher, wrought ornamental iron work; Max Marcus, wrought iron showcase; P. Marcus, wrought iron. Munich—Robert Smith & Co., candlesticks, hinges, tea stands; Gottfried Stumpf, palm tree of beaten iron, candlestick; Peter Koebbel & Son, wrought iron work, fancy; Joskunst, wrought iron door knockers, clock cases, &c.; Reinhold Rirs, lamp shades, lanterns, lattices, &c.; Joly Eisenwerk, Wittemberg, adjustable supports for lattices; L. Mannstaedt & Co., Kalk, lattice work for ornamental iron; Val. Hammerau, Frankfurt-on-the-Main, wrought iron ornaments for gateways, &c.; Fred. Keyser, Leipsic, flower baskets, tables, jewel caskets, &c; Carl Koeshert, Dessau, fancy wrought iron work; F. K. Buhler, Offenburg, wrought iron gate, embossed patterns in wire screen (wrought iron); Gebr. Armbruster, Frankfurt-on-the-Main, ornaments of wrought iron and ornamental metal work.

Canada—Sedingham Bros., Victoria, B. C., horseshoes.

Mexico—Gran Fundicion de Hierro de Monterey, Monterey, articles in iron.

Austria—Vienna—Alex. Nehr, artistic iron work done by hand; Auter Schwarz, artistic iron work; Ludwig Wilhelm, artistic iron work; Fred. Hubner, artistic forging; Edward Ferkely, Sig Pauditz Establment, ioxidating wrought and cast iron.

Sweden—J. W. Oterly Company, Limited, Dannemora, milling machine, cutters and tools; Uddeholm Company, Limited, Uddeholm, steel springs and horseshoe nails; Degersfors Iron & Steel Works, Degersfors, hammers and stonemason's tools; Fagarsta Iron Works Company, Limited, Ustafors, springs and sundry tools; Finspong Gun Factory Company, Limited, Skon arbo, tools for working stone; E J. Ljunberg, Falun, horseshoe nails; P. Peterson, Surahammar, bowls of pressed steel plates; A. G. Svedelius, Uddeholm Company, Limited, Soderfors, cold rolled steel springs.

Russia—St. Petersburg—P. P. Fon Derlos, horseshoes and nails; V. A. Kondakoff, models of horseshoes; L. Renner, artistic wrought iron ornaments

Spain—Santamaria, Barcelona, corrugated steel gates.

Germany—Moeller & Co., Hagen, rosettes and ornaments; Armbruster Bros., Frankfurt, artistic wrought iron work and gates; Franz Brechenmacher, Frankfurt, wrought iron, park gates, &c.; K. Buchler & Son, Offenburg, modern wrought iron lattice.

Ceylon—Ceylon Government, Colombo, brass art ware, pewter plates.

Belgium—Société Anonyme des Usines et Fonderies de Zincs de la Vielle Montagne, Angleur, samples of roofing.

Denmark—M. Pederson, Brenderslec, brass and tin work.

New South Wales—J. L. McEachern, Albury, horseshoes, jumping, draft, coach, hunting, and racing shoes, set of farrier's tools; William Pitman Sydney, improved horseshoes; John L. McEachern, Albury, horse sling.

A few exhibitors in this group are not yet reported on and will be announced later, approved by the Executive Committee on Awards.

Iron and Steel and Their Products.

In Group 49, Department of Mines and Mining, embracing metallurgy of iron and steel, with the products, the awards follow:

Illinois — Chicago — Cambria Iron Works, four awards, collection of products, washed metal, Kelly steel converter and sections of iron and steel rails, steel axles; Crane Elevator Company, two steam reversing engines; Chicago Fireproof Covering Company, mineral wool, its manufacture and products; Sanderson Bros., tool steel; Illinois Fluor Spar & Lead Company, fluor spar and its processes.

Massachusetts—Washburn & Moen, Worcester, iron and steel bars, rods and wire.

New Jersey—S. J. Meeker, Newark, malleable iron, gray iron and brass castings.

New York—Chrome Steel Works, Brooklyn, collection of products of chrome steel.

Michigan — Elk Rapids Iron Company, Elk Rapids, charcoal pig iron.

Minnesota — Duluth Furnace Company, West Duluth, pig iron.

Missouri—Iron Mountain Company, Iron Mountain, photographs and charts of mills and mines.

Ohio—Otis Steel Company, Cleveland, steel boiler and fire box plate, cast steel rolls; State Board, four awards, Ohio iron shapes, pig iron, collective exhibit of iron ore, cold rolled steel; Youngstown Steel Company, Youngstown, pig iron and washed metal; Columbus & Hocking Valley Coal and Iron Company, Straitsville, pig iron; Briar Hill Iron & Coal Company, Youngstown, pig iron.

Pennsylvania — Pittsburgh — Singer, Nimick & Co., steel; W. Dewees Wood Company, iron and steel sheets and plates; Sterling Steel Company, steel armor projectiles; Crescent Steel Company, three awards, mining drill steel, fractures of steel, steel (die) compressed polished drill rods; Elwood Iron Tube Works, Philadelphia, metal tubing of steel; Alan Wood Company, Philadelphia, sheet iron and steel; Carpenter Steel Company, Reading, steel specimens; Chestnut Hill Iron Company, Columbia, iron furnace charge and products; Pennsylvania Steel Company, Steelton, bridge materials; Bethlehem Iron Company, South Bethlehem, nickel steel; Tyler Tube Company, Washington, charcoal iron tubes; Pottstown Iron Company, Pottstown.

California — Clipper Gap Furnace, Placer County, pig iron.

Ohio—Solid Steel Company, Alliance, collection of castings of open hearth steel.

Germany — Essen — F. Krupp, ten awards, bed plate of molded steel casting, collection of steel casting, collection of steel tires, pressed steel centrifugal vessels, steel cast center for locomotive driving wheel, collection of forging of open hearth steel, steel cast stem for armored vessels, steel cast locomotive frame, collection of products of iron and steel including compound armor plates; Kgl. Friedrich Smelting Works, Tarnowitz, products and ores of zinc; D. C. Olls & Co., Dahlhausen, drawings of a coke oven; G. Luttur, Magdeburg, drawings showing blasting operation at the Ersomic Thee Danube, &c.; Rud. Boecking & Co., Neunkirchen, cast iron pipe, rolled and forged iron bars, wires; Kgl. Friedrichsgrube, Tarnowitz, 26 pieces lead and zinc ores; Hoerde Mining & Steel Company, Hoerde, Westphalia, wheels, axles and iron superstructure for railway; George Mary Mining, Iron & Steel Company, Osnabruck, rail, joints and sleepers, &c.; Union Actiengesellschaft fuer Bergbau Eisen und Stahl Industrie, Dortmund, pressed castings, axles and wheels for locomotives; Union Stock Company for mining iron and steel, Dortmund, products of steel; W. Fitzner, Laurahuette, collection of hand welded objects in wrought iron; Bochumer Verein, Bochum, chime of barge steel cast bells; Hoerde Mining & Steel Company, Hoerde, Westphalia, sections and specimens of materials; Association for Sale of Spiegeleisen, Siegen, spiegeleisen; Deutsch Oesterreichische Mannesmann Works, Berlin, seamless Mannesmann pipes for oil wells; Fried. Krupp Grusonwerk, Madgeburg Buckau, chilled iron; Gute Hoffnungshuette Oberhausen, iron work for exhibition hall of Fr. Krupp; Johann Wolfg, Fuchs, Nuremberg, fine wires of steel, &c.; Stumm Bros. & Rud. Boecking Company, Neunkirchen, articles made of steel rails; Stumm Bros. & Rud. Boecking Company, Neunkirchen, collection of cast iron pipe; Masch Anstalt, Kalk, rolled steel; Phœnix Actiengesellschaft Bergbaur & Huettenbetrieb, Laar near Ruhrort, section of grooved rails; Vander Zypen & Charlies, Cologne, Deutz, solid, pressed parts of steel for passenger and freight cars.

Great Britain—Low Moor Iron Company, Bradford, sea lime, coal and ironstone and refined metal, puddle and finished iron; Jessop & Son, Sheffield, crucible cast steel in bars, sheets and forgings.

Italy—Sagsamoto Vanzette & Co. Milan, steel castings.

Mexico—Ricardo Honey Limapan, Hidalgo, iron rods worked in a cold state.

Russia—Princess Abancleck, Lazarwoa, collection of iron bars and sheets; Votkinsci Iron Works, Votkinsci, three awards, cold and hot test of Martin steel, collection of models and drawings, collection of pig iron and steel; Mountain Blagodat Mine, Peru Blagodat, magnet iron ore and associated rock; Balashoff Bros., Ufa, specimens of pig iron; Huta Bankowa Iron Works, Dombrowa, 24 specimens of steel bars; iron works of Mr. Rastorgwebt, St. Petersburg, 381 specimens of molding of cast iron; Katharine Iron Works, Petrokoff, one roll for mills; Z gazinsky Iron Works of Mr. Shemoff, Ufa, three rings of cast iron; Chubinidge, Kivirili Caucasus, four specimens of manganese ore, pyrolusite; Mining

Hosted by Google

Administration of South Russia, manganese ore

Siam—Government of Siam, Bangkok, iron, sulphur and copper ores, &c.

Spain—Altos Hornos, Bilbao, iron and steel ingots.

Sweden—Osterby Iron & Steel Works, Dannermora, collection of charcoal and bar iron; Sandviken Iron Works, Sandviken, bands of steel; Jernkontoret, Stockholm (five awards), collection of charcoal, pig and cast iron, collection of iron ore, collection of Lancashire iron, Bessemer open hearth steel, collection of steel castings, collection of iron and steel in bars, rods, &c.; Uddeholm Company, Uddeholm, collection of iron ores and products of iron and steel.

Venezuela—Government of Venezuela, Caracas, iron ores.

Austria—Crucible Steel Factory, Kladno, steel in all forms; Manufactory of Iron and Steel, St. Egyd, files and scythes; Gartenberg, Lauterbach, Goldhammer & Wagmann, Drohobyer, different kinds of ceresine and osokerite; Establishment for Rolled Tin Plate Rudolfshuette, Teplitz, thin sheet iron.

Brazil—Fabric de Ferro de Zpanoma, St. Paula, bar iron and other products.

Canada—Canada Iron Company, Montreal, ores.

Antimony and Other Metals.

There were a few awards in Group 54, Mineral Department, metallurgy of antimony and other metals not specially classed. The medal winners were:

California—Mathison Smelting Company, San Francisco, Star antimony.

FOREIGN COUNTRIES.

Great Britain—Johnson, Marthey & Co., London, platinum and platinum apparatus and metals.

Japan—Kumasuke Kawabata, Zeuts, stibinites dressed ore; Kudo Yoshimichi Wada Ehime, refined antimony; Fijitagumi, Osaka, pure antimony.

For Tin and Tin Plate.

Awards in Group 52 are for metallurgy of tin, tin plates, &c. They follow:

Ohio—Cincinnati Corrugating Company, Piqua, American terne plate.

South Dakota—Hill City—Harney Peak Company, tin ore treated by concentration and smelting; Mining District of Hill City, tin ore prison rock; Keith & Co., Deadwood, calcium carbonate of lime; Harney Peak Mining Company, concentrates casserite, black tin; Bear Gulch, tin ore casserite.

FOREIGN COUNTRIES.

Japan—Kihachiro Kawamoto, Kyoto, tin foils and papers.

Early Apparatus in Mining.

In Group 68, Mines Department, which includes originals or reproductions of early and notable apparatus used in mining, the following awards were made:

California—California State Mining Bureau, rocker with sieves and pan for washing and testing gold.

Massachusetts—City of Lynn, Mass., first iron casting made in America.

New York—George F. Kunz, Tiffany & Co., New York, historical implements, instruments, medals and relics.

United States Government—Department Mines and Mining, department exhibit of transparencies.

Graphites, Clays, and Asbestos.

Group 46, Department of Mines and Mining, includes graphite and its products, clays and other fictile materials and their direct products, asbestos, &c. The awards were in part as follows:

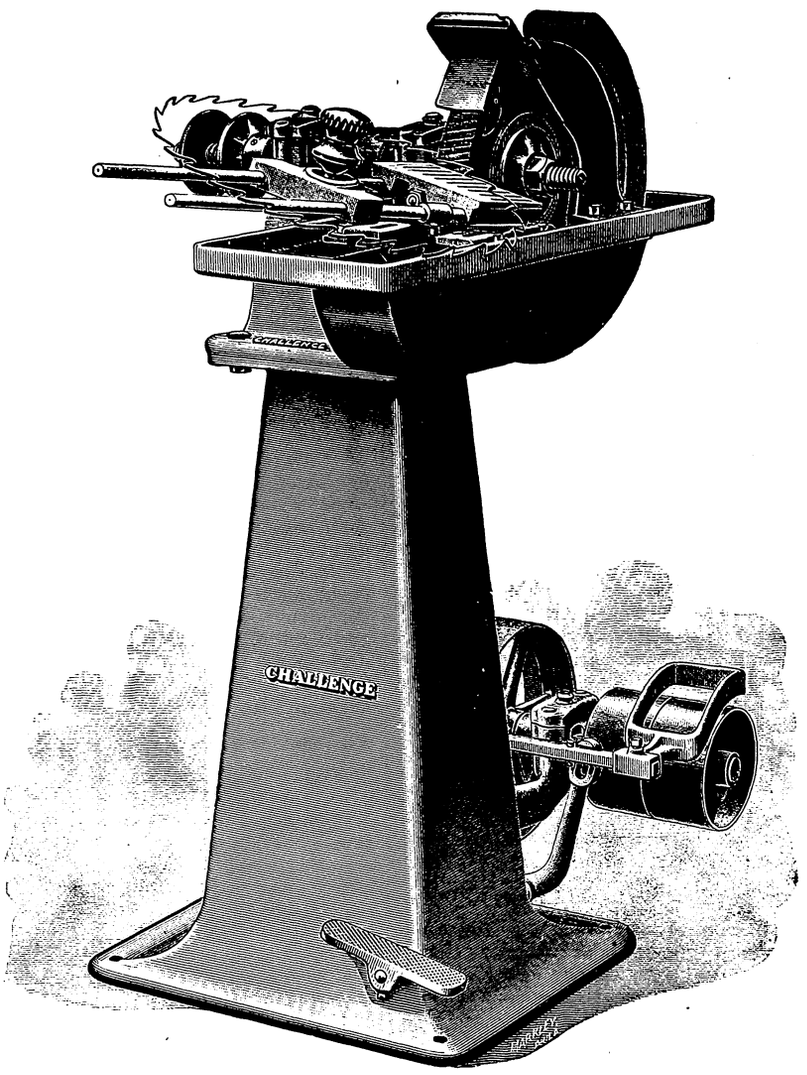
Colorado—Golden—Golden Pressed Fire Brick Company, collective exhibit of clays and bricks; C. P. Hoyt, clays, Kaolin.

Georgia—Chicago—Salt Mountain Asbestos Company, short fiber asbestos in rock and ground.

Illinois—Chicago—H. W. Johns Mfg. Company, asbestos manufacturing machines and products.

Indiana—Indianapolis—United States Encaustic Tile Works, encaustic tile.

Massachusetts -- Taunton — Phœnix Mfg. Company, graphite crucibles.



Missouri—St. Louis Hydraulic Brick Company, brick and fire clay.

New York—Glasgow—F. M. Van Dusen and 16 others, Glasgow, tempering of sand, &c. Ticonderoga—Dixon Crucible Company, graphite, crude, in lumps. New York City—H. W. Johns Mfg. Company, technical display of asbestos.

Pennsylvania—Philadelphia—Cyrus Borgner, fire brick and clay retorts; Georgia Beauxite Mineral Company, beauxite mineral ore; Robert Taylor & Son, graphite crucibles, retorts, dipping cups; Star Encaustic Tile Company, floor and hearth tiles, plain and encaustic; Beaver Falls Art Tile Company, Beaver Falls, embossed and enameled tile.

The Challenge Emery Grinder.

We here illustrate a new emery grinder, with saw sharpening attachment, which is so arranged that one of the wheels may be run dry and the other with water. The device incasing the wheel on the right is for wet grinding, water being used to prevent drawing the temper of the saws when being ground; a similar device, not shown in the cut, is also provided when wanted for dry grinding. These wheel guards are so arranged as to catch and retain all the dust and grindings without requiring the employment of exhaust fans, and they also serve as a protection to the workman in case of accident to the wheel. The guard for wet grinding differs from that for dry grinding in having an opening at the back through which the curved piece shown is introduced to control the hight of the water in the tank below, the amount of water thrown upon the work depending upon its hight, or the depth to which the wheel enters it. The piece mentioned is held in place by a spring, and can be instantly adjusted to any desired level. By the form of hood adopted the water picked up by the wheel is thrown directly on to the work, and the hood can, by the arrangement shown, be readily adjusted to suit the wheel as the latter wears down. The guard for dry grinding will also hold water below, which serves

THE CHALLENGE EMERY GRINDER.

Hosted by Google

to catch and retain all dust and grindings. Both arrangements are provided with separate pockets in front, this separate pocket being for water in which to dip tools.

The machines are built in seven sizes, suitable for wheels from 10 to 30 inches diameter, the smaller sizes being arranged to place on the bench, belting from above or below, or they are mounted upon a plain base or upon the one shown, which has countershaft attached. In this latter arrangement the driving side of the belt passes through a hole provided for that purpose at the top of the column and down through the hollow column to the driving pulley.

The attachment for sharpening saws is so arranged that circular saws of any shape or pitch for rip or cross cut can be put in perfect round, gummed and ground straight or bevel to any desired degree, the teeth being exactly alike. It will be noted that the face of the wheel shows transverse corrugations, the purpose of which is to prevent glazing and heating and to increase the cutting. This is done by a double dresser furnished with the machine, one end of which forms corrugations, while the other end dresses to a smooth surface for fine grinding. This machine is made by the Appleton Mfg. Company of Thirtieth and Thompson streets, Philadelphia.

WORLD'S FAIR NOTES.

J. G. Hoffman

of Chicago, inventor of the Tornado fan blower, exhibits one at Column L 33, Machinery Hall. A forge of his design, supplied with a trough, is also shown. The Tornado fan blower has a combined crank and lever motion and gives an after blast the same as a bellows. There is no dead center and it can therefore be operated from any point with either a long or short stroke. All parts are interchangeable, and the fan shaft runs on hardened centers with self oiling supplies. These goods are manufactured by the Hurlbut Mfg. Company of Racine, Wis.

The Walworth Mfg. Company

of Boston, Mass., have a large and comprehensive exhibit at Column O 27, Machinery Hall, of the many articles for which they have long been known as manufacturers. In a handsome case of ebony finish, supported by Ionic pillars, displayed against a black background, a beautifully finished assortment of nickel-plated steam and water fittings stands out in strong relief. Two sections of the Mills boiler, which they now manufacture, and the Walworth automatic sprinkler, are conspicuously shown. Cast iron fittings, valves and an extensive variety of expansion joints are displayed. The Ashley and Stillson wrenches, so well known as the product of this company, are tastefully arranged, while an attractive feature is the Hall tapping machine, which is used for tapping street mains of from 4 to 24 inches in diameter while under pressure. A brass railing surrounds the entire exhibit, while on each corner a support for street railway service, either for trolley wires or elevated system, blocks off their large space.

Allington & Curtis Mfg. Company

of East Saginaw, Mich., have one of their dust collectors in full operation at Column E 53, Machinery Hall, in connection with a Sturtevant fan. The efficiency of their collector is made apparent to every one who visits the exhibit.

The U. S. Wind Mill & Pump Company

of Batavia, Ill., have constructed a building in the wind mill section on the exposition grounds, which is in the shape of a wind mill base. It gradually tapers toward the top, where a 30-foot Halladay wheel revolves and transmits power to a number of machines of their manufacture, shown in the 40-foot circular room below. Among these are noticeable an I-X-L feed mill and sheller, saw frame, horse-powers, having tools and pumps. Models of their several wheels are also shown.

E. B. Steele

of Chicago, manufacturer of adjustable window derricks for the hoisting of organs, pianos, safes, &c., has an exhibit in Machinery Hall, at Column M 30. The fastenings of this derrick are positive and rigid. Those shown at the fair have stood a test of 8700 pounds and will safely carry 6500 pounds. They are easily erected and may be quickly taken down for transportation, consisting merely of a frame work to fit in an ordinary window frame, to which it is easily clamped. Attached to the frame work is a projecting piece in inverted V shape, the sheave being fastened in the apex.

The Goodsell Packing Company

of Chicago have an interesting exhibit at Column I 32, Machinery Hall, of their engine packing, showing raw flax and coil after coil of their combination of braided flax, woven duck and rubber cushion for piston rods, pump plungers, &c. Showcases contain the Rubber Back Flax and the Swain Metallic Packing made by them. This packing is in wide use for steam, water, air, ammonia, &c.

The National Machinery Company

of Tiffin, Ohio, exhibit a large line of machinery at Column K 46, Machinery Hall, most of which is shown in operation. The company are extensive builders of bolt and nut machinery; also upsetting, bending, spike, rivet and wire nail machines, &c. The display of bolt and nut machines is an excellent one, the specimens shown demonstrating the perfection achieved in this line of automatic machinery. The bolt cutters comprise a 1½-inch single, 1-inch double, a 1½-inch double, a 2½-inch double, and a double rapid track. For the purpose of giving a correct idea of the dies used in these cutters a head has been separately mounted, which is fitted with four different kinds of dies —flush case, plain, case and hat. The plain die is made of a piece of steel cut off at an angle of 50°. The hat die is made in the same way, but has a milled steel hat or plate fitted close with one screw on top, to prevent it moving endwise. The case die is made of malleable iron; cores are cast and then broached to exact size, grooved on both sides to lift easily in the die ring; has all the back bearing; is grooved in front to throw the chips, and has a sharp edge to remove any grit that may get in the slots of the barrel. The flush die is made by dividing the face plate on the head in four parts and shouldering the case and holding the chaser by means of a shouldered screw. The mechanism for opening and closing the head of these bolt cutters is an important improvement, permitting this to be done either automatically or by hand. Another improvement is a centering device for the jaws. The double rapid track bolt cutter is adapted to the continuous threading of bolts for one or two days without changing dies, as practiced in bolt works. With two spindles 5000 track bolts can be threaded per day, while a three-spindle machine will thread 7000, at a speed of 250 revolutions per minute. The nut tappers shown are of two kinds. One is a six-spindle back geared machine, with the spindles arranged in a straight frame. The power is applied between the bearings on the driven spindles, any one of which can be stopped independently of the others by a treadle immediately underneath. There are six changes of speed. The other style of tapper shown is a rotary. It occupies a conspicuous position in the front of the exhibit, and its unique appearance always attracts a crowd of spectators. This machine has ten spindles arranged in a circle, traveling round a central column. These spindles are driven from a central spur wheel, fixed at the center, and all the spindles having pinions engaging with it. Below the spindles a large pan revolves simultaneously with them containing the holders for the nut blanks. The operator stands in front of a place on the central spur wheel where a worm thread has been fixed which engages with rack teeth on each spindle as it comes round. The spindle thus rises from the completed nut, which is then removed by the operator and a fresh blank is inserted for tapping. It performs its work well and with remarkable rapidity. A bolt heading, forging and upsetting machine is shown, which is one of the most powerful of its class, especially adapted for use in large railroad, forge, bridge and car shops. It has a suspended rocking die attached to a hinge toggle motion and operated by an eccentric face cam on a side shaft. One of these was recently sold to the Eames Vucuum Brake Company of Watertown, N. Y., who have since sent some 800 pounds of forgings to be shown in connection with the National Machinery Company's exhibit. These forgings embrace a number of heavy pieces of rather difficult pattern. Other machines exhibited are a No. 3 bolt heading and upsetting machine, an improved Burdict bolt header, a hot pressed nut machine and a wire nail machine, besides a model of the National rock and ore breaker. A full sized breaker is exhibited in Section X S, Post 9, Transportation Building. Since the exposition opened the company have sold 60 of their wire nail machines to the I. L. Ellwood Mfg. Company of De Kalb, Ill., and ten to the Carnegie Steel Company for their Beaver Falls works. Numerous sales of other machines have also been made through this exhibit to domestic and foreign firms, whose names are conspicuously displayed in connection with prints of the machines on a bulletin board. J. W. Duntley, 1020 Monadnock Block, Chicago, is general sales agent for the company.

The Wm. P. Miller Company

of 100 Greenpoint avenue, Brooklyn, and 212 Washington street, Chicago, make a good display of their lubricating material at Column L 33, Machinery Hall. The columns of their booth are formed of boxes of American and Universal lubricant, Shield cylinder grease and Victory compound, and cans of lubricating compound and Shield cylinder grease, the boxes forming the bases and caps of the columns and the cans forming the center. The roof has a cornice

Hosted by Google

of shafting cups. A pyramid is erected in the center of the booth for the display of more shafting cups, while piles of cans of lubricating material are grouped about the space. In connection with this exhibit, a sample is shown of the Wiley safety oil cabinet by R R. Street & Co., 184 and 186 Washington street, Chicago. This is a receptacle for oil, intended for use in stores and factories, having a sink with a hinged lid at the top where oil is drawn and measured, the drippings going back into the cabinet, a hydraulic seal preventing evaporation. It has a wood case and a zinc lining to keep the oil cool in warm weather and prevent the generation of gas. The oil is pumped or syphoned into the cabinet from the original barrel.

Curtis & Curtis

of Bridgeport, Conn., exhibit samples of their specialties in pipe working tools at Column J 38, Machinery Hall. Among these are several power cutting and threading machines, the largest being shown belted up and in practical operation on 8-inch pipe. Half a dozen other sizes of such machines for either hand or power are exhibited, but not in operation. Two of them are mounted on bases with countershaft and driving pulleys attached, but the others consist merely of the cutting head, shown as a portable hand machine. All have samples of threaded pipe attached to show the exact work done on each size of machine. The Forbes die stock used in these machines is a complete tool, being all that is required to thread or cut off pipe, while much lighter than the old style of stock and the vise which must accompany it. With it one man can cut off and thread large pipe up to 8 inches diameter by hand and without assistance, while with the smaller sizes a boy can thread 2 and 3 inch pipe with but one hand on the crank. The bits draw back out of the way when the thread is cut. The parts are shown of an ingenious pipe and bolt threading attachment for lathes. This attachment has been devised to meet the wants of those whose work does not warrant the purchase of a regular power pipe threading machine. It can be fixed to any lathe within certain limits of size. It consists of a die carrying head attached to the spindle like a chuck, an adjustable self-centering vise attached to the carriage, and an adjustable pipe rest attached to the bed of the lathe to support long lengths of pipe. The feeding is done by hand, or an automatic feed can be arranged by setting the lead screw of the lathe to the number of threads corresponding to the standard of thread to be cut. Samples are shown of pipe vises, both hinged and solid frame, also reversible ratchet drills and reversible ratchet die stocks.

The Dake Engine Mfg. Company

of Grand Haven, Mich., exhibit at Column I 37, Machinery Hall, the most singular engine in the exposition, which is known as the Dake square piston double reciprocating engine. The cylinder of this engine is square and only from 2¼ to 5 inches thick for power ranging from 1 to 20 horse. The piston being reciprocating, and taking steam at four different points, all danger of a dead center is avoided, and the engine starts off promptly on the admission of steam. The company make a specialty of small engines of 1 to 20 horse-power for all purposes. They are specially adapted, however, for direct attachments, as, for instance, to fans, blowers, centrifugal pumps, dynamos, &c. Those in operation in this exhibit are driving fans and blowers, running very smoothly and noiselessly at high speed. For the purpose of showing the interior construction, the head has been removed from the cylinder of one engine and replaced by glass, the piston being run by a belt from another engine. Machines of this type have now been in use constantly for two years without perceptible wear. Marine engines are shown, which have been devised for various uses on shipboard, such as hoisting freight, reeling hawsers, &c. The same engines are adapted to use as builders' and contractors' hoists. There are also square piston double reciprocating engines with a reversing lever attached, which simply admits steam from opposite directions according to the position of the lever, and without complicating the engine in the least. Yacht and launch engines are thus easily arranged and take very little space The company make a steam feed engine of the same type for sawmill use. These engines have attracted much attention, especially from foreign visitors.

J. E. Lonergan & Co.

of Philadelphia make a fine exhibit of pop safety valves and oil cups at Column M 27, Machinery Hall. These are shown on a set of pyramidal shelves in the center of the space and in showcases on either side. Safety valves are arranged about the lower part of the pyramid and oil cups on the upper shelves. The showcases contain elegantly finished oil cups. The safety valves are well designed and so constructed as to give prompt and reliable action in service, holding the steam remarkably close to working pressure and not allowing it to rise above the point set, if the valve is of the proper size. Water relief valves are shown, which are designed for use on steam pumps, fire hydrants, steam fire engines, feed water heaters, &c., wherever an automatic valve is needed to relieve overpressure of water and prevent hose or pipe from bursting. These are also used on steam engines to prevent damage caused by water in cylinders. Lock-up valves are also shown for portable farm, fire and hoisting engine boilers. In connection with the foregoing devices an exhibit is made of steam specialties manufactured by Timothy Kiely of New York. These comprise a positive acting pump governor for automatically returning condensation to boilers when a low pressure is carried or the exhaust is used for heating purposes; a Standard steam trap, containing an open float that cannot collapse, and, being hinged to the cover, has three or four times the power of open floats ordinarily used in drain traps; high pressure reducing valves constructed to carry up to 200 pounds on the high pressure side and to reduce to anywhere from 15 to 180 pounds without the slightest variation, pressure regulators, back pressure valves, multitubular oil and steam separators, return traps, &c. This entire display is under the charge of the Chicago Engineer Supply Company, 108 Lake street, Chicago, Western agents for the sale of the goods. They have issued a handsome catalogue, covering these and other steam appliances.

Frequent recent attempts at train wrecking have obliged the Canadian Pacific Railway to patrol its tracks near Quebec with armed men.

Fuel Oil System at the Fair

As is pretty generally known, no coal or other solid fuel is used for steam purposes at the exposition. The large quantity required—about 550 tons per day of twenty-four hours—for firing the immense steam plant would have rendered the problem of providing, storing and preliminary handling a very serious one, to say nothing of the army of firemen and laborers required. The mere matter of collecting and disposing of the 75 or 100 tons of ashes would have involved a considerable amount of trouble and expense, and it would have been impossible to avoid the very objectionable necessity for running railroad trains into the grounds continuously, which, with the attendant switching, would have been highly dangerous to life and limb. In view of these facts, and also that it may be considered as being more in the line of progress, the use of oil fuel was very early decided on, the intention being that the composite system employed should place on exhibition the latest and most improved forms of oil-burning apparatus and appliances relating thereto, as well as the receiving, storage and distribution systems. The exceptional nature of the conditions to be met rendered it necessary to exercise the utmost care in making the plans. Any mistake or oversight which, in case of an ordinary plant would be of little or no importance, might lead to very serious results in this instance.

On the score of magnitude the plant may be considered as unprecedentedly large—not, possibly, as to the steaming capacity, but as an all oil-fired boiler plant. It is, necessarily, somewhat complicated, as, in addition to the boilers in the main battery, there are several isolated steam plants of considerable size throughout the grounds which are operated by this system. In order to obviate the necessity for delivery by tank cars a 6 inch pipe line was laid, connecting the system directly with the Standard Oil Company's refining works at Whiting, Ind., thereby insuring an unfailing supply at all times. The fuel is not crude petroleum, as stated, but "residuum"—a by-product from the refining of illuminating oils—the actual fire test of which is 350° F. As this is very considerably above any probable temperature to which either the main volume of oil in the storage tanks or that in the pipes forming the distribution system can be exposed, it may be considered as absolutely safe from accidental explosion or ignition; as a matter of fact, however, as will be clearly apparent from the accompanying illustrated description, the system now in operation is so perfect in all essential details, and so well provided with safety and precautionary devices, that even were the alleged "crude oil" used, it might be done with perfect safety, notwithstanding the explosive nature of the liquid fuel, due to its large percentage of free hydrogen.

In order as much as possible to isolate the receiving and storage tanks, oil pump house, &c., they were located at the most remote point within the grounds, namely, in the narrow angle formed by the boundary fence and Lake Michigan, at the extreme southeast corner. It is here so far removed from the nearest buildings that even if the entire body of oil stored were ignited, the danger of a general conflagration would be very slight. From the pump house the oil is conveyed to boiler house by a 5 and 6-inch wrought iron pipe laid under-

Hosted by Google

ground at a sufficient depth to protect it from all external influences. These pipes are paralleled by 2-inch live steam pipes their entire length to insure fluidity at all times. Within 300 feet of the boiler house an inverted syphon or U is placed, while directly following is a pavilion or valve station, from which the entire distribution system is controlled. In case of fire or danger of any kind, the attendant, who is stationed night and day in the valve house, can within a few seconds not only stop the flow of oil from the pumps, but actually reverse the action of the latter and cause them to draw from and quickly empty the entire line of distributing pipes and return the contents to the main storage tanks from which it was drawn.

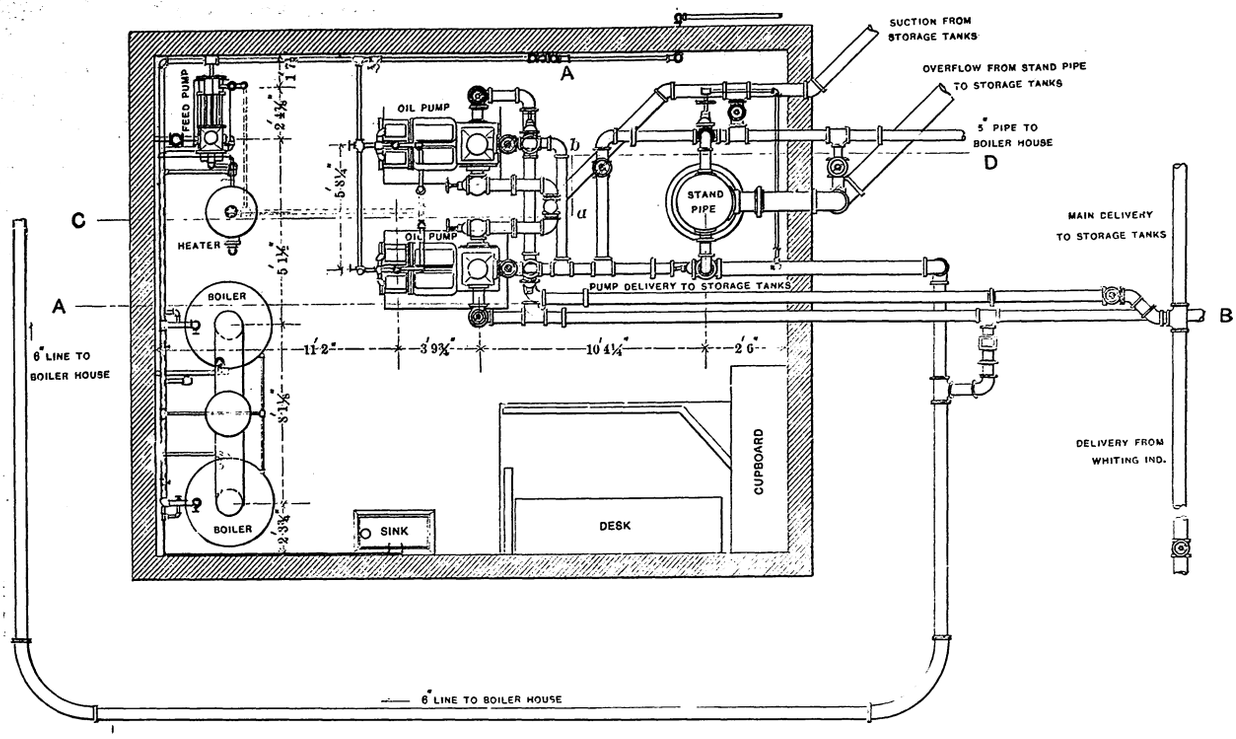


Fig. 1.—Plan Oil Pump House.

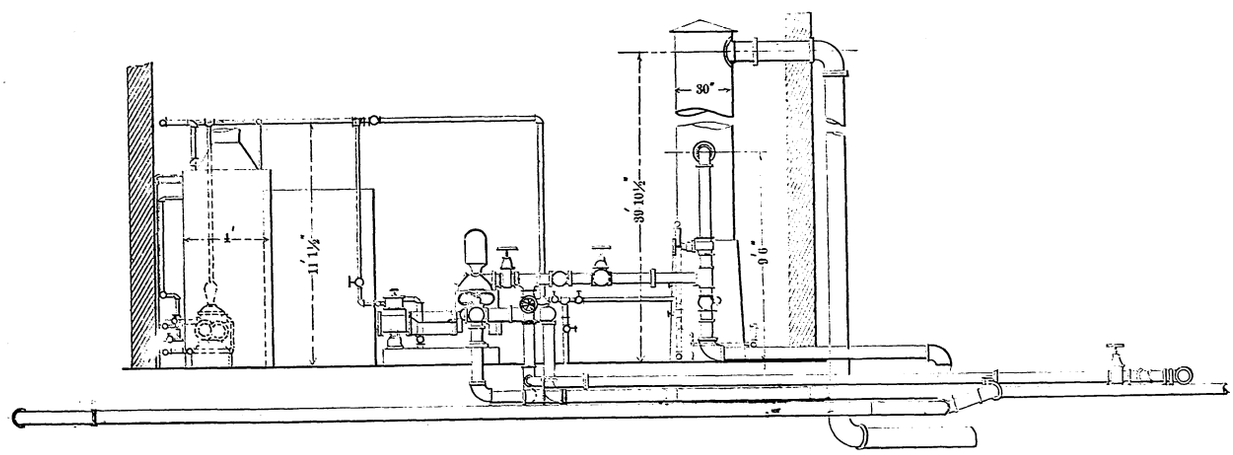

Fig. 2.—Section A B Oil Pump House.

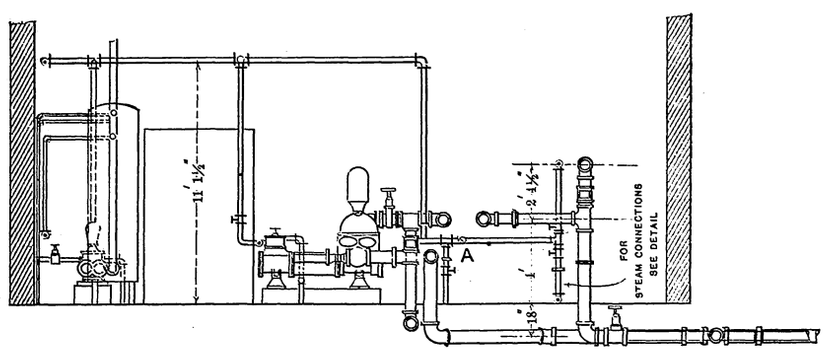

Fig. 3.—Section C D Oil Pump House.

FUEL OIL SYSTEM AT THE FAIR.

Within the fire room, and running the entire length of the battery of boilers, the main supply pipe is laid in a trench close to the foundation of the boiler fronts, and covered by close-fitting cast-iron floor plates. This pipe is wrought iron, 5 inches diameter. From it to each burner is a ½-inch vertical pipe, provided with a globe valve, and above the latter a union for connecting the burner. This valve is used exclusively as a shut-off, and is entirely independent of the regulation, which is effected by means of adjusting valves belonging to the burner itself, and used for no other purpose. The burners may therefore at any time be disconnected and removed for cleaning or inspection, regardless of the flow of oil in the main pipe. The burners used are exhibits,

Hosted by Google

and comprise many different makes, as shown by the following list of boilers and their equipments :

Make of Boiler.	Make of Burners.	Number of Burners.
Abendroth & Root	Reid	16
Gill	Armstrong	12

Heine	Reid	12
Heine	Wright	8

particularly advantageous to the use of oil fuel. With the exception of those using the Reid burners, however, the furnaces are of the ordinary standard construction ; while in case of the latter they are modified—or, more correctly, supplemented—by the use of a vertically curved bridge wall, like a side arch, having its concave side toward the burners, which are so placed

portion of the boiler being subjected to the severe temperature of initial combustion. Also, by reason of the very high temperature of the hearth and arch, a large quantity of radiant heat is thrown off to the evaporating surfaces of the boiler.

Referring now to the several drawings, the entire system may be followed, from the main receiving pipes to the

As all of the above boilers are of the water-tube type, their settings afford large combustion chambers, which are as to throw the mass of flame at a slight angle toward the hearth. As it impinges at a tangent at all points of hearth and bridge wall with which it comes in contact, the flame is thrown forward and upward without undue frictional resistance, and is thus brought within the influence of the chimney draft at a greatly reduced velocity, and a most perfect diffusion effected without any burners, and it will be readily seen how little foundation there is in fact for the sensational statements made concerning danger from fire from this plant. Figs. 1, 2 and 3 are, respectively, plan and sectional elevations of the oil pump house, showing the arrangement of pumps, stand pipe and suction and discharge pipes, &c. It will be seen that the pumps are in duplicate,

Hosted by Google

each having its independent pipe connections, which are similar in all respects and capable of the same manipulations in handling the oil. Each pair is of ample capacity for furnishing the required supply at a low rate of piston speed, and it is the work of but a moment to change from one to the other, in case of necessity. There is but one stand pipe, as there can be no contingency which would render a duplicate either necessary or desirable. Tracing out the system of piping, the 6-inch delivery from Whiting connects directly with the storage tanks. A second 6-inch pipe, at right angles with the first, connects with the main suction pipe of the pumps. This is for pumping the oil from tank cars on the adjacent railroad siding, in case of emergency through any accident or stoppage of main supply by pipe line. By making the necessary setting of the several valves, the pumps draw from the cars and discharge through the main receiving pipe to the storage tanks. This duty may be performed by either pair of pumps, while the other is delivering the oil to the distribution system, and, therefore, there is no danger of interruption of the supply, whatever be the source of delivery.

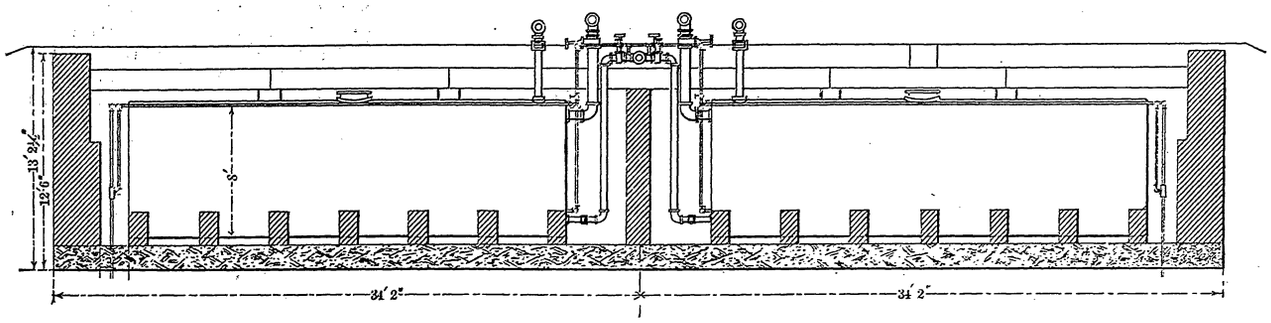

Fig. 5.—Section Oil Storage Vaults and Tanks.

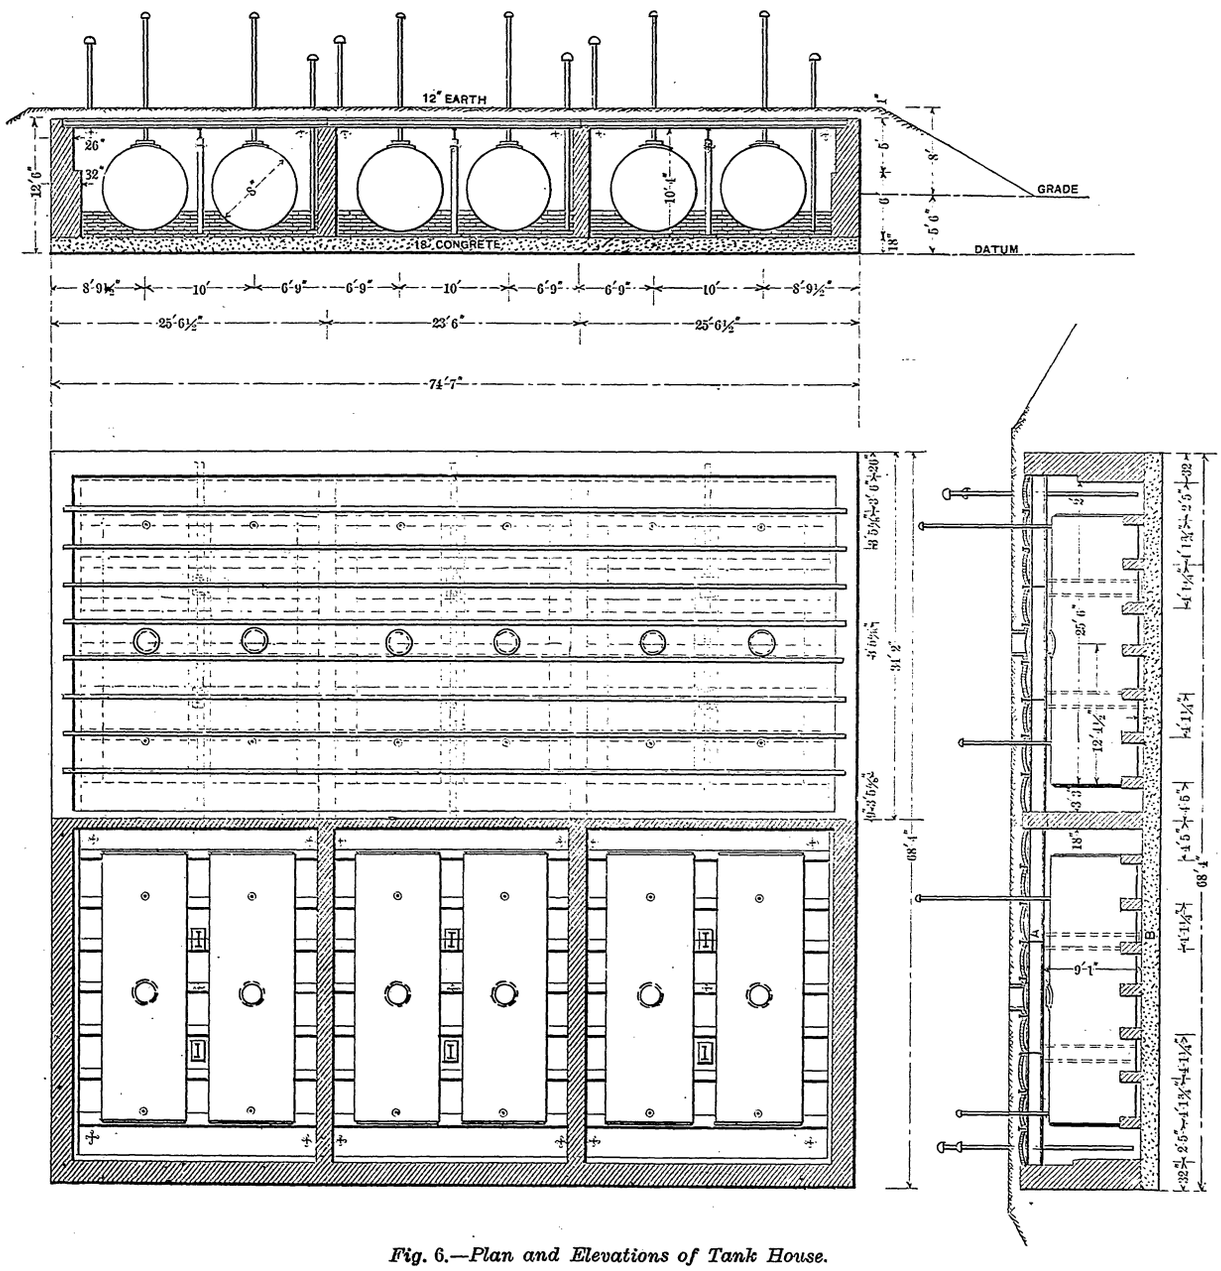

Fig. 6.—Plan and Elevations of Tank House.

FUEL OIL SYSTEM AT THE FAIR.

In case of accident to the storage tanks, although a very remote contingency, the pumps may be made to draw directly from either the main or auxiliary receiving pipes, by simply changing the necessary valves. The oil pumps are 8 x 8½ x 10 inches stroke. They

Hosted by Google

are furnished by the Snow Pump Company, and are of the duplex direct-acting type, having suction and discharge chambers common to both cylinders. It will be noticed that there are two independent suction connections, one on each side of the pump, which, by means of their respective valves, determine the source of supply. Those on the inner sides of the two pumps, through the U pipe, connect directly with the storage tanks; and also through valve in T connection and 5-inch pipe with the main discharge pipe and overflow of stand pipe. By this arrangement it is readily seen that in case of accident not only can the delivery of oil to the distribution system be promptly stopped, but that the latter may be quickly emptied by the pumps and the contained oil delivered to the storage tanks. This may be accomplished either through the stand pipe overflow, or directly from the pumps through the discharge connection with main receiving pipe. In the former case the changing of three and in the latter of four valves are all that is necessary; and as these valves are all quick acting, and may be manipulated without stopping the pumps, the operation is under almost instant control. The discharge connections and the two independent delivery pipes are clearly shown in the drawing, and need not be specially referred to.

The stand pipe, Fig. 2, is of the closed top pattern, 30 inches internal diameter, by 39 feet 10½ inches from engine room floor to top. A 9 inch overflow pipe connects directly with storage tanks, the center of opening being 1 foot below the top of the stand pipe, while the connections with the pump discharge are 9 feet 6 inches above the floor line. The hight of oil level is about 37½ feet above that of the burners in the boiler house, and this head gives a pressure of about 13 pounds. It will therefore be seen that instead of the oil being supplied to the burners by gravity pressure there is sufficient fall to the pipes in the other direction to empty them by gravity, and that the direct pressure of the pumps, regulated only by the stand pipe, is employed for the delivery, Figs. 4 and 5 show the details of the storage tanks, which need not be described. All the details of the two systems of piping for oil and steam are clearly indicated; and the necessary manipulations of valves may be readily traced. The drainage of the vaults is collected in a sump, from which it is discharged by a steam syphon ejector by simply opening a steam valve. The arrangement of heater coils in the tanks is shown by dotted lines in Fig. 4, and their connections with the steam main in the vertical section, Fig. 5.

The location of the vaults renders them entirely isolated from any buildings, and they are entirely surrounded by an earth embankment reaching to the top of the retaining walls. This feature, of itself, would render the storage system perfectly safe, as even in the extreme case of all of the tanks being disrupted—say by lightning—and their contents released, the oil would still be confined to the vaults, and if set on fire, by lightning or otherwise, could burn itself out without damage to the surroundings. The two sections, Fig. 6, illustrate this point, and also the method of ventilating the tanks by open pipes.

In Fig. 7 is shown the plan of the system of valves for controlling the distribution at the boiler house end of the line. The 6-inch pipe at the left and the 5-inch at the right hand are continued in a direct course from the pump house, as shown in Fig. 1. They join in a common 8-inch pipe, and each is controlled by a valve close to + connection. The syphon is shown in horizontal position for convenience in making the drawing, and will be understood to stand upright. The entire arrangement of valves is extremely simple, and can be manipulated without danger of mistakes, as their locations indicate the portions of the system which each is intended to control.

As to the efficacy of the syphon there is room for question, and it may be mentioned that its use was entirely as a concession to the requirements of the Board of Underwriters.

A pavilion is used as a station for regulating the oil supply and also as a point of observation of the chimneys of the boiler house, to detect any signs of smoking from careless or improper management of the fires. There is at all times, day and night, an attendant stationed in this building whose duties are to control the oil supply and also to act as smoke inspector. In the former capacity he has within easy reach all the necessary valves, as per Fig. 7, by which the flow of oil may be regulated, or, in case of accident, shut off instantly, regardless of the pumps, as the only effect on the latter in such case would be to cause the excess of oil delivered to pass through the overflow of the stand pipe back to the receiving tanks. Electric signals and telephone connections from the boiler house to the station and from the station to the pump house enable the firemen, inspector and pump attendants to communicate promptly with each other, so that no time may be lost in case of emergency requiring speedy action. A thorough and systematic smoke inspection is carried on and a daily report made.

The receipt and consumption of oil by the system described necessitates the use of a very carefully arranged method of measurements and records thereof, as the most convenient—in fact, about the only practicable—means of ascertaining the quantities received and expended is by measuring the hight of oil level in the tanks. An "outage" table was prepared by the National Supply Company, in which is shown the quantity of oil, in gallons, contained in the tank for each ¼ inch in depth up to the full 95 $\frac{8}{16}$ inches, which is the internal diameter of tanks. Each tank is provided with an accurately graduated gauge, from which the oil level may be observed before and after receiving or expending and at periodical intervals. In these measurements it is, of course, very important to note the temperature of the incoming or outgoing oil, and convenient means are provided for the purpose. Reports of receipts and expenditures are taken from the record books and returned daily to the superintendent's office. The forms used are bound in books, and are in duplicate, the writing up being done by the use of the carbon manifold method to prevent discrepancies between original and duplicate, which might occur if any transcription plan were employed. The original is perforated for tearing out, while the duplicate remains in the book as part of the engineer's record. The form for oil received is printed in black ink, while that for consumption is in red. On the former record all settlements with the Standard Oil Company are made, which may be considered a very fair criterion of the accuracy of the system.

On the score of safety the plant certainly appears to meet all possible requirements. Its efficiency is fully demonstrated by five months of continuous

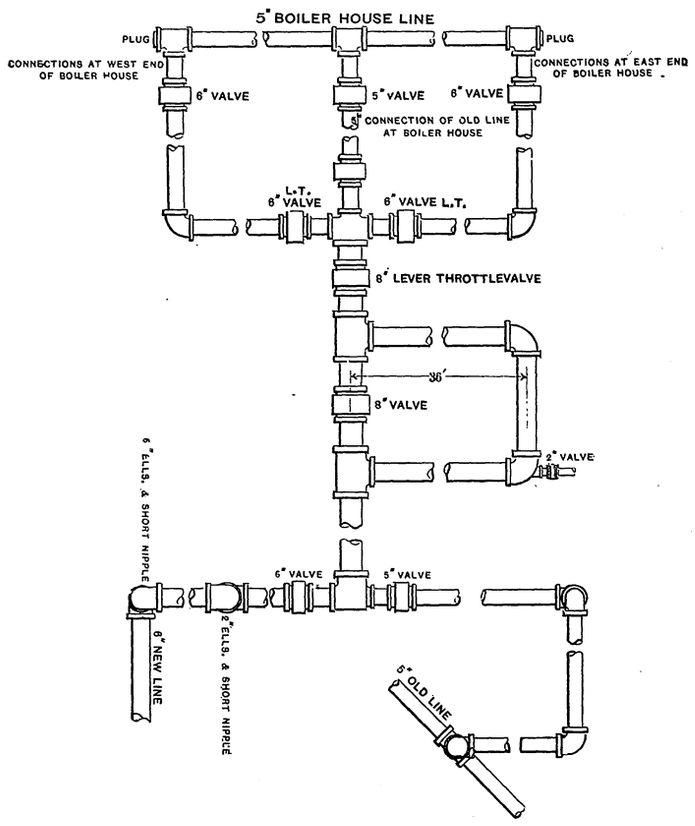

Fig. 7.—Diagram of Oil Pipe Connections in Boiler House.

FUEL OIL SYSTEM AT THE FAIR.

Hosted by Google

operation. As regards the question of comparative economy no tests have yet been made, and this point is, therefore, still to be determined. All machinery, material and instruments were furnished under contract by the National Supply Company, the labor by the Exposition Company, under the supervision of the former company. The entire engineering work was done by C. O. Billow, engineer of the National Supply Company, who has had long and extensive experience in the installation of oil fuel plants, and of whose work this is the crowning achievement.

THE WEEK.

The latest Cunarder "Lucania," which on her initial trip from Liverpool to New York beat all previous maiden records by a run of 5 days 15 hours and 37 minutes from Queenstown to Sandy Hook, made her second westward trip last week in 5 days 13 hours and 25 minutes, thus breaking the best former record—that of the American liner "Paris"—by 59 minutes. The chief engineer of the "Lucania" believes that she has not done her best yet, and that she may be relied upon to still further lower the time of transit by several hours.

Cuban papers contain complaints of a great dearth of good field laborers.

The first consignment of corn ever sent from Mexico to Europe will be shipped next week from land adjoining the Monterey & Mexican Gulf Railroad, Mexico.

Some important shipments of anthracite have been recently made to England, and inquiries are noted for quotations on American coal from Mediterranean and other foreign ports, where the difficulty of obtaining adequate shipments from Great Britain since the strike is being severely felt.

Improvements proposed by the Dock Board on the North River front of New York from West Tenth to West Twenty-third streets comprise 19 large piers, 80 feet wide and ranging from 466 to 729 feet in length, with a distance between each pier of 225 feet, thus allowing two steamers to unload at the same time. The inside cost of the undertaking is placed at $11,000,000, but this would probably be materially increased if the whole scheme is carried out.

In the United States Circuit Court of Philadelphia on October 7, an injunction was obtained by the Edison Electric Light Company against the Westinghouse Light, Heat & Power Company for alleged infringement on incandescent lights.

Cuban sugar planters expect that the yield of next season will be a heavy one, and will enable them to retrieve the losses of last season, always provided that no cyclone visits the island during the present month. The appearance of the cane fields throughout the sugar region is described as very promising.

In illustration of the improvement which has developed recently in railroad freight traffic, the Philadelphia *Times* remarks that a few weeks ago the Pennsylvania Railroad had 16,000 idle freight cars standing along its various sidings. Reports received a few days ago showed that the number had been reduced to 6000. What is true of the Pennsylvania is also true of the Lehigh Valley. Hundreds of its freight cars which have been lying idle for months back on the coal region side track are now reported as in demand for Western coal and grain traffic, and all the empties have been ordered for inspection, preparatory to forwarding them West.

Business in Havana is reported as paralyzed, owing to the refusal of the customs authorities to accept bank notes in payment of duties.

The opening of the Manchester ship canal, which is announced for January 1, 1894, will enable cotton steamers to land their cargoes close to the mills, thus saving railway freights and the expense of handling on the other side. The canal is likely to make Manchester a formidable rival to Liverpool as a British port of entry.

Advices from Hazleton, Pa., intimate uninterrupted activity in the coal trade for this season in the Lehigh region.

Owing to the accident to the cruiser "Montgomery," now at New London, Conn., the board of naval officers appointed to witness the trial of the vessel has been dissolved. It is estimated at the Navy Department that the accident and the delay will cost the builders, the Columbia Iron Works of Baltimore, fully $25,000; but this sum, it is said, could be materially reduced if the contractors will allow the trial to take place at once, notwithstanding the damage. Admiral Belknap's official report shows that while the injuries to her hull are serious, they are not such as to disable her. The damage cannot be determined until the ship is put in dry dock, but it is estimated that $10,000 will be necessary to repair her, and that the work will consume a month.

Orders have been sent by the Navy Department to Rear-Admiral Belknap, at New London, Conn., directing him to send out the dynamite cruiser "Vesuvius" on the unique and hazardous duty of blowing up 14 derelict vessels that endanger navigation. All the derelict vessels to which the "Vesuvius" is assigned were wrecked during the recent hurricane on the Atlantic Coast, and nearly all are adjacent to the Jersey shore.

The Bethlehem Iron Company shipped last week 64 tons of plate for the battle ship "Maine" to the national proving grounds at Washington. The plates are 8 x 15 feet, and 12 inches thick. These plates are the first service plates that have been Harveyized, and their trial will consequently be of interest.

Connection was made last week on the longest telephone line in the world except that between New York and Chicago. It stretches from Spokane, Wash., to Portland, Ore., by way of Puget Sound, a distance of nearly 600 miles.

The estimated quantity of gold yielded from the mines of Victoria, Australia, from 1851 to 1892 is 58,101,429 ounces, valued at $1,115,547,437.

A piece of expeditious work is reported from New Jersey in the inauguration of the Newark and South Orange Railroad. After a bitterly contested litigation the company were, last Friday, granted a franchise for the erection of their trolley system by the South Orange Board of Trustees. Fearing an injunction might be obtained, they put 300 men to work on Friday night; poles were erected, wires strung, and electricity turned on at 10.40 a.m. on Saturday, the first car being run over the line in a little over 12 hours from the time the franchise was obtained.

The largest oil tank steamer afloat is now loading in the port of New York. She is the British steamship Batoum, chartered by the Standard Oil Company. The vessel, which was built this year at Sunderland, England, has a capacity of 2,700,000 gallons of oil in bulk, which is fully 800,000 gallons more than any other tank steamer in the world can carry.

Encouraging results are said to be obtained from the exploration of the Piedras Negras coal mines of Mexico, which is being made for the C. P. Huntington interests.

Final estimates of the Kansas Board of Agriculture place the total wheat harvest of that State for the present year at 24,881,448 bushels, an increase of 5,000,000 bushels over the September estimate.

Treasury Decisions.

Wire Cloths and Nettings.

Before the U. S. General Appraisers at New York, September 6, 1893. In the matter of protest, 17,682b–62, of James McQueen, against the decision of the Collector of Customs at Detroit, Mich., as to the rate and amount of duties chargeable on certain wire cloth, imported per Grand Trunk Railway, November 5, 1892. Opinion by Sharretts, General Appraiser.

The merchandise in question is wire cloth and netting for milling purposes. We find as facts regarding the same:

1. The wire in the cloth—weight, 180 pounds—is smaller than No. 26 wire gauge, and costs 6 cents per pound.

2. The wire in the netting—weight, 45 pounds—is smaller than No. 16 and not smaller than No. 26 wire gauge, and costs 3 cents per pound.

3. The specific rate of duty provided in paragraph 148 for wire of the kind in question is greater than 45 per cent. ad valorem.

The Collector classified the merchandise as manufactures of metal, and assessed duty at 45 per cent. on its value in the finished condition. The appellant claims that the wire cloth is dutiable at 5 cents per pound and the wire netting at 4½ cents per pound, in accordance with the provisions of paragraph 148.

In our opinion the claim of the appellant is well founded. The merchandise is denominatively provided for in paragraph 148, and is subject to the specific duties provided therein for wire of corresponding size and value, and, in addition thereto, 2 cents per pound.

The protest is sustained and the Collector's decision is reversed.

From the annual report of the School of Mines, Victoria, Australia, it is learned that in the year 1892 the yield of gold in that colony showed an increase of 78,056 ounces over the output of the previous year, being the highest yield reported since 1886. The number of miners employed in the gold industry is 23,518.

Owing to the prolonged stoppage of operations at the rolling mills and blast furnaces in the Youngstown, Ohio, district, distress among the workmen is now reported, and public subscriptions are being raised for a relief fund. Generous amounts are being contributed.

The Sheet Mill Situation.

It is now generally conceded that the situation of affairs between iron and steel sheet mill operators and their employees who still adhere to the rules and agreements of the Amalgamated Association is badly strained, although operations are being continued. In July of this year quite a number of concerns signed the scale agreed upon between manufacturers and the Conference Committee, but trade developments since that time have shown a downward tendency in values, and there is such a marked difference in conditions that concessions on the part of the workmen are asked for. If not granted there will be an effort made to secure them by a forced cessation of work, rendered absolutely necessary in consequence of the inequality between prices now paid for labor and current prices realized for finished product in comparison with last year's figures. It is not easy to determine what the solution of the difficulty is likely to be, for the reason that there is a split in the camp of the manufacturers as well as among the workmen, and it now appears that local circumstances may govern the agreements made between mill owners and their skilled workmen. Notwithstanding the fact that the same scale of wages has for many years past been signed by sheet manufacturers in various producing centers, it can be proved that many mills have had the advantage of concessions made by the workmen which were not in strict accordance with the rules and prices of their signed agreement, but at the same time justifiable, to enable their employers to run their mills at a fair profit on some particular class of work of which they made a specialty.

As the matter now stands only two important moves have been made in the direction of a general breaking up of organization among manufacturers, one being a reduction of 10 per cent. in wages made by the New Philadelphia Iron & Steel Company, New Philadelphia, Ohio, which must necessarily affect other nearby mills, and the withdrawal of the Apollo Iron & Steel Company from the Association of Iron & Steel Sheet Manufacturers. The last named concern have taken a decided stand, and their mills will not be started except upon a non-union basis. Other manufacturers have also indicated that they will withdraw and as a result of the general disruption, the various sheet mill districts may each have a special scale of wages and code of rules. What may be satisfactory in the Wheeling district may be otherwise at Cincinnati, Canal Dover, Niles, New Philadelphia or other Ohio mills, and a difference in the class of work may require special terms with workmen employed in the mills of Western Pennsylvania or Indiana. Local conferences are numerous, but definite understandings are not reached; meanwhile mills are kept running filling special orders of an urgent character, after which they will shut down until wage matters are settled.

Railroad Construction in 1893.

An interesting statement with regard to railroad construction this year is made by the *Railway Age* of Chicago. The total new mileage laid during the first nine months of the year, as obtained from official sources, was 2040.85 miles. Ordinarily, at least 50 per cent. more track would be laid during the remaining three months, but from the present outlook it is regarded as doubtful if the total for the year exceeds 2500 miles. Details of the track laid in each State or Territory for the nine months are as follows:

Track Laid in First Nine Months of 1893.

State.	Lines.	Miles.
Alabama	5	46.
Arizona	1	42.
Arkansas	4	12 75
California	7	64.32
Colorado	2	16.76
Florida	7	103.50
Georgia	6	62.50
Idaho	1	5.57
Illinois	7	64 80
Indiana	5	21.10
Iowa	1	4.
Kansas	1	18.45
Kentucky	5	25.50
Louisiana	3	8.25
Maine	2	71.50
Massachusetts	2	11 13
Michigan	1	0 50
Minnesota	4	42.21
Mississippi	1	3
Missouri	7	139.95
Montana	1	27.
Nebraska	2	32.70
New Hampshire	1	1.
New Jersey	1	2.
New Mexico	1	2.54
New York	6	31.39
North Carolina	8	69.60
North Dakota	2	194.60
Ohio	5	134.70
Oregon	1	11.50
Pennsylvania	43	364.05
Rhode Island	1	5.21
South Carolina	1	14.
South Dakota	2	62.06
Tennessee	3	17.30
Texas	6	140.82
Utah	1	9.
Virginia	5	16.64
Washington	2	41.90
West Virginia	14	76.05
Wisconsin	3	19.
Wyoming	1	4.
Total in 42 States and Territories	182	2040.85

If the estimate for the year proves correct, and the total new track laid does not exceed 2500 miles, the year 1893 will show a retrogression in this respect to the conditions obtaining in the period from 1874 to 1878, when the new track laid ranged annually from 1711 miles to 2712 miles. From present appearances the estimate will not be exceeded, as the rail mills of the country are all idle or running only spasmodically on very small orders, and if there was any considerable length of track to be laid during the fall and early winter this would not be the case. Taking the condition of the country's finances the past summer, it is rather surprising that even this much work has been accomplished in new construction. It would have been in entire harmony with the general wreck of business if all such work had been completely stopped. Its continuance under such discouraging circumstances excites the hope that as soon as the disturbing elements now interfering with commercial interests are out of the way there will be considerable activity in this direction.

Railroad building has not been overdone in recent years, and there are numerous deserving projects for new lines and extensions that are only waiting propitious times to be launched on the financial sea. There was a sudden dip downward in railroad construction in 1885, when the new mileage fell slightly under 3000 miles in consequence of financial disturbance, but it was followed by a quick recovery the next year, when over 8000 miles of new track was laid. While the panic of 1884 which caused that depression in railroad building was by no means so serious as the recent crisis, still the nation's recuperative power at this time ought to be fully as strong if not stronger, should wisdom rule in pending national legislation. The currency and tariff questions should be settled speedily. With these out of the way, no longer menacing business of every description, new enterprises in railroad building as well as in other lines would again be undertaken and new vitality would be imparted to our languid manufacturing interests.

The Success of the American Tin Plate Industry.

The last report of Ira Ayer, Special Agent of the Treasury Department, shows that even at this early date the American manufacturers of tin plate have reached a state of development which brings then very near the attainment of the quantity called for by the tariff act. Even under the strictest interpretation of the law its requirements would now be met, if the financial panic had not interfered. Under the recent Treasury ruling only those tin and terne plates are counted as being American which have been made from black plates rolled in this country. The tariff act provides that the present duty shall stand if it can be shown to the satisfaction of the President of the United States that the American product of plates weighing less than 63 pounds per 100 square feet is equal to one-third of the importations in any one of the fiscal years up to June 30, 1897.

Thus far the year of lightest importations has been the fiscal year ending June 30, 1892. One-third of the net imports thus figure out 79,307,939 pounds. During the quarter ending June 30, 1893, the production of tin and terne plates from American black

Hosted by Google

plates was 18,264,225 pounds, of which about 94 per cent. were plates weighing less than 63 pounds per square inch, or say 17,167,000 pounds. To this must be added, according to law, 2,322,455 pounds of tinned or terned articles made from American sheet iron or steel. This carries the total for the quarter, under the narrow lines fixed by the present Treasury officials, to about 19,489,455 pounds. If this rate is kept up for four successive quarters, covering a fiscal year, the American producers will have complied with the provisions of the act, because the product would be close to 79,000,000 pounds, which is the mark to be passed.

We know that full capacity had not been attained in the quarter ending June 30, 1893, although it did show an advance from 14,102,299 pounds to 20,586,680 pounds, comparing it with the preceding quarter. It is quite sure that if general business is in a normal condition the manufacturers of tin plate in this country can make from American black plates a sufficient quantity to meet the requirements of the law. The only point concerning which any doubt might possibly arise is whether our sheet mills are now in a position to readily supply the needed annual quantity of 75,000,000 pounds of plates lighter than 63 pounds per 100 square feet.

We took occasion recently to criticise the tables relating to capacity issued by the Treasury Department and printed in *The Iron Age* of September 14. The table then printed assigned to makers of tin plate from American black plates an annual capacity of about 30,250,000 pounds, based on three and one-half times the product of the quarter ending March 31. At the time of the publication of that article there were in the possession of the Department the sworn returns of the manufacturers for the last quarter of the fiscal year. These show an actual make of over 18,000,000 pounds, or at the same rate of figuring, by multiplying by three and one-half, an annual capacity of about 64,000,000 pounds, or double the estimate of the Treasury officials. We believe that no more evidence than this is required to show what means are resorted to by hostile officials to create impression adverse to a rapidly developing industry. We need hardly add that we do not hold Ira Ayer responsible for work so little worthy of Government officials.

Davies & Co.'s automatic galvanizing machine is rapidly making headway among the manufacturers of galvanized sheet iron in this country. The Whitaker Iron Company of Wheeling are putting in a second machine, and so are the Cambridge Iron & Steel Company of Cambridge, Ohio. The New Philadelphia Iron & Steel Company of New Philadelphia, Ohio, have just put in one machine. The Falcon Iron & Nail Company of Niles, Ohio, are also making arrangements to introduce the process in their works on quite an extended scale.

Supplementing the announcement made in the last issue of *The Iron Age* to the effect that an agreement between the rolling mill operators of the Mahoning Valley and the two associations of workmen was not probable to occur comes the information that the manufacturers have refused flatly to enter into any further negotiations with the men except as individuals. Upon this understanding old employees will be dealt with, but as a body representing any organization they will no longer be recognized.

"Julian Bessemer," an Imposter.

A few weeks since a young Englishman called upon a number of iron and steel manufacturers of the Mahoning Valley, representing himself to be a grandson of Sir Henry Bessemer, and, presenting a card, upon which was printed "Julian Bessemer, Sheffield, England," he claimed to be in need of funds, and endeavored to obtain social recognition. Suspicion was aroused, and J. G. Butler, Jr., president of the Mahoning and Shenango Valley Manufacturers' Association, communicated with Sir Henry Bessemer, from whom the following reply was received:

165 DENMARK HILL, SURREY,
September 21, 1893.

JOS. G. BUTLER, JR., ESQ.,

DEAR SIR: I duly received your favor of the 10th inst. and beg to thank you very much for the trouble you have so kindly taken in giving me the information which your letter contains in reference to a person falsely representing himself to be a grandson of mine.

In reply to your letter allow me to inform you that I have only six grandsons, each of whom I am in the habit of seeing or hearing from almost every week. I may add that not one of my grandsons has ever been in the United States, nor is there any such person as "Julian Bessemer" a resident of Sheffield, England, or I must long since have heard of him; nor have I or any of the Bessemer family ever resided in Sheffield, although I had a works there managed by my partner.

The simple fact is that in England there are only nine males living of the name of Bessemer, that is, my two sons, and my six grandsons, and my nephew, a gentleman over 40 years of age.

I am, therefore, forced to conclude that the young man who called on you has simply assumed the name of Bessemer for the purpose of obtaining money from some of the many gentlemen in America who have honored me by taking a deep interest both in me and in the invention which bears my name.

I beg to remain, dear sir,
Yours very sincerely,
HENRY BESSEMER.

The young man is described as 5 feet 7 inches tall, slender, with florid complexion, a smooth face and talkative to a degree beyond garrulity. He described accurately the Liverpool reception of the American engineers in 1889, naming a number of Englishmen who were present.

The description given tallies with that of a young person who some time since victimized Americans as a nephew of Sir Joseph Wentworth, and it is possible that it is the same who assumed the title of a nephew of Sir Lowthian Bell. It is needless to add that American manufacturers and engineers will do well to scrutinize carefully the credentials of any person claiming relationship with leading English manufacturers and inventors. The youthful fraud will probably quickly abandon the business when it ceases to pay.

The setting up of the machinery at the Watervliet, N. Y., Arsenal is progressing rapidly. It is expected that everything will be in readiness to start the new plant by winter. The Pond Tool Company have fulfilled their contract and erected all the lathes and other machines specified. The Niles Tool Company have yet one large turning and boring lathe to put in position. This will be complete in about two weeks. After that all the lathes and smaller machines will be given the finishing touches and the new south wing will be ready for operation. A number of other improvements for general convenience and the comfort of employees are being made about the works.

Engineers Society of Western Pennsylvania, Pittsburgh, Pa.—The regular meeting of the society was held on September 19, thos. H. Johnson in the chair The papers read at the June meeting on "Gas and Gas Producers," by Walter E. Koch, and on the "Effect of Suddenly Applied Loads Upon the Tensile Strength and Other Properties of Iron and Steel" were fully discussed. Charles Hyde gave an interesting discussion on "Water Tube Safety Boilers," illustrating his remarks by a working model of the Hyde water tube safety boiler. On September 22 and 23 the visiting French engineers were entertained by the society. On the 22d an excursion took place by railway to the MacDonald oil and gas field and to the coal mines of the Pittsburgh Consolidated Coal Company. On the 23d a visit was made by steamboat to Homestead, McKeesport and Davis Island Dam. Very many of the largest and most important steel works, electric plants, inclines and street car power houses were also visited. On the evening of the 23d the members of the committee of the Engineers' Society and of the manufacturers of the city were the guests of the French engineers at a dinner at the Monongahela House. At the meeting of the chemical section on September 26 the subject of "Standard Methods for Sampling and Analysis of Iron and Steel" was discussed. Jas O. Handy read a paper on "The Effect of Arsenic on Phosphorus Determinating in Iron and Steel."

Another deflection from the lines of the Amalgamated Association of Iron and Steel Workers has recently been made. The roll turners of the United States were represented at a meeting held in Pittsburgh last week and the initial steps taken to form a separate organization. Roll turners from all important districts were present and agreed unanimously to sever their allegiance from the association of which they had long been members, but which, according to their claims and statements, had never rendered them the practical benefits promised when they joined.

Industrial establishments at Muncie, Ind., including several rolling mills and other important manufactories, are harassed considerably, owing to the town being placed in a state of quarantine on account of smallpox. Whether needed or not no workmen or any other persons are allowed to pass in or out of town, and the relatives of workmen from the East, who are employed there, are seriously worried over the dearth of news in regard to the exact condition of affairs.

Stockholders in the American Steam Boiler Insurance Company have filed a petition that the Attorney-General move for the appointment of a receiver for that concern.

CORRESPONDENCE.

A Proposed Combination of the Blast Furnace and the Bessemer Converter.

To the Editor: I have for many years considered that the ordinary blast furnace is not absolutely perfect, but is capable of improvement and modification. When I have suggested this to my friends they have been shocked at my audacity and heresy, but have failed to show me that I am in error. Knowing that Americans are not so prejudiced and are more liberal than we English, I venture to ask some of your readers to carefully examine the question and to put me right on this important subject.

My theory is, that by a combination of the Bessemer converter and blast furnace, pure iron can be smelted rapidly (even from phosphoric ores) with less fuel than is now required, and that the escaping gases will contain less nitrogen and more combustible gas than any Siemens gas obtainable from the best known gas producers. I have arrived at this opinion for various reasons, among others because:

1. When iron ore is smelted in the blast furnace a certain proportion of slag is necessary in order to wash down the reduced iron, and also to prevent it being reoxidized by the blast of air which enters at the tuyeres, consequently very rich ores cannot be smelted in the blast furnace without the addition of slag producing materials. Whereas, in the proposed furnace (or in a modification of the Bessemer converter and Siemens regenerative furnace) there would be no free oxygen present to reoxidize the reduced iron, because the oxygen in passing through the molten metal would be converted into carbonic oxide, which would assist in reducing iron, and the fusion of the metal would be completed by contact with the molten bath, thus avoiding any necessity for slag.

2. Rich ores or even the fuel used will contain some silica, and it is therefore necessary to add sufficient basic materials to rather more than neutralize the silica and other acids, so that any phosphoric acid present will be neutralized and retained in the slag, preference being given to alkalies, so as to produce a liquid slag, which is facilitated by the high temperature of the Bessemer as compared with the blast furnace operation.

3. The escaping gases will contain less nitrogen and more carbonic oxide, because only air is introduced in the Bessemer operation and the oxygen from the ores combines with carbon and thus increases the proportion of combustible gas as compared with nitrogen.

4. The reduction of iron in the presence of free carbon takes place at a comparatively low temperature. In 1869, when making metallic coke, part of the oxide was reduced in the coking operation, and afterward, when Thomas Blair used the metallic coke at John Brown & Co.'s Atlas furnaces, Sheffield, reduction took place rapidly, for the metal contained in the coke was smelted in 12 hours instead of 36 hours, the time usually required with the ordinary charge of ore and coke. The metallic coke contained an excess of carbon, and some of the coke, after yielding up its metallic contents, was withdrawn at the tap hole; this leads me to believe that by using a small excess of carbon a zone of carbon would be maintained above the molten bath.

5. The reduction and fusion of the iron must be a very rapid operation if 0.7 ton Fe—say 14 hundredweight—is to be reduced during the short time that would be occupied in oxidizing in the Bessemer portion of the furnace 0.225 carbon from the molten bath, consequently it will be advisable and may be even necessary previously to pulverize the ore, because the smaller the ore the more contact there would be between the oxide of iron and free carbon, and it would be also well and with poor ores necessary to separate from the oxide of iron as much of the extraneous gangue or foreign matter as possible, so as to enrich the ore and reduce the slag producing materials. This can be done by the magnetic separator or by specific gravity aided by water or air or in any way found most convenient. The powdered oxide of iron, small coal and basic materials should be intimately mixed together, and it might be even advantageous to add bitumen and press same into blocks or metalliferous briquettes before introduction into the furnace.

The calculations hereunder are based on the following assumptions: 1. That crude molten iron is Bessemerized in the ordinary way, but that the upper part of the converter is somewhat like a blast furnace, having above the molten bath a zone of carbon, and above that zone carbon and small iron oxide, the latter as free as possible from extraneous matter; sufficient lime or other bases having been added to more than neutralize all the silica present in the charge, so as to produce a sufficiently basic slag—*i. e.*, the oxygen in the bases must be in excess of the oxygen in the silica and other acids present.

2. That the Bessemer converter has a carbonaceous neutral lining, and is so constructed that when the molten bath exceeds, say, 40 tons, and rises above a certain hight, the excess flows off into a Siemens furnace or into another Bessemer converter, where the slag is withdrawn and the crude iron is converted into steel.

3. That the crude iron is introduced at 1650° C., and the excess withdrawn or flows off at the same temperature.

4. That after the crude molten iron is first introduced and until the furnace is white hot, only carbon is added, and free carbon will take up sufficient carbon by impregnation, so that not less than 0.225 carbon is oxidized in the Bessemer operation during the time the 0.7 Fe is being reduced by means of a further quantity of carbon from 1.0 Fe_2O_3—viz., 0.225 C, so that altogether 0.45 C is used to smelt 0.7 Fe_2—*i. e.*, equivalent to about 15 hundredweight coke per ton of iron smelted, or, say, 20 hundredweight bituminous coal. The furnace should be fitted with appliances for collecting the products of distillation, and when coal is used, additional carbon will be required for distilling off the volatile products of decomposition.

6. That the nitrogen, carbonic oxide, hydrocarbons, ammoniacal liquor, &c., pass off at a temperature not exceeding and probably considerably less than 300° C.

7. That only iron is reduced, not silicon, phosphorus, &c., and this should be the case, because the reduction of iron takes place at a comparatively low temperature, and basic materials are present so as to produce a sufficiently basic slag.

8. That the time occupied in reducing 14 cwt.—*i. e.* 0.7—Fe is five minutes, viz.: the time occupied in oxidizing 0.225 carbon in the Bessemer operation. This would be equivalent to the reduction of 200 tons of iron in 24 hours—*i. e.*, 0.7 Fe × 12 × 24 = tons 201.6.

9. That the pressure of blast is 20 pounds per square inch and that 0.3 oxygen × 12 × 24 = 86.4 oxygen + 289.2 nitrogen, *i. e.*, 375.6 tons air are driven through the molten metal in 24 hours, or 0.261 ton of air per minute.

10. That the escaping gases will be composed of about equal quantities of carbonic oxide and nitrogen besides hydrocarbons, &c., viz.: Tons in 24 hours, 289.2 nitrogen, 86.4 oxygen + 86.4 oxygen + 64 8 carbon + 64.8 carbon—*i. e.*, 289.2 nitrogen + 302.2, carbonic oxide + hydrocarbons, &c.

11. That the ore introduced is Fe_2O_3, but if magnetic iron ore, for example Marbella iron sand, is used, the quantity of carbon required for reduction would be proportionately reduced, whereas spathic iron ore would require an additional quantity of fuel to calcine and drive off the carbonic acid from the ore.

In Bessemer Converter. Heat Obtained by Oxidation.

0.225 carbon + 0.3 oxygen = 0 525 carbonic oxide. 0.225 × 5366 (calorific value C + O) =		1,207.35
1 Fe_2O_3 = 0.7 Fe + 0.3 oxygen. 0.3 oxygen × 6216 (calorific value of 1 liter oxygen) / (1 liter of oxygen weighs) 1 4298 grams =		1,304.24
0.225 carbon + 0.3 oxygen = 0.525 carbonic oxide. 0.225C × 5366 (calorific value of C + O) =		1,207.35
Net loss of heat in reduction of iron from Fe_2O_3 =	96.89	
0.7 Fe × 0.114 (specific heat of Fe) × 1650° C. (temperature of bath) =	131.67	
Evaporation of Water:		
0.5 coke × 10 per cent. = 0.05 × 540 heat units =	27.00	
1.0 ore × 0.5 per cent. = 0.05 × 540 heat units =	27.00	
	54.00	
Fusion of slag, 0.1 slag × 550 heat units =	55.00	
Carbon impregnation, 0.225 × 2400 heat units =	540.00	
These 540 heat units should probably be omitted, because the crude iron afterward gives up the carbon when oxidized in the Bessemer converter.		
Transmission of heat through walls, say	30.00	
Escaping Gases:		
0.525 CO + 0.525 CO + 1.05 nitrogen = 2.1 × 0.245 specific heat × 300° C. =	154.35	
Margin to cover sundry minor factors omitted	145.44	
		1,207.35

afterward carbon and iron ore in the proportion of two of oxide of iron to one of carbon.

5. That the partially decarburized iron being constantly in contact with

The advantages may be briefly summarized as follows:

1. Economy of fuel.

In blast furnace practice about 0.6 slag is produced to 1.0 Fe smelted,

Hosted by Google

whereas in the proposed furnace the slag will be reduced to a minimum.

0.6 slag to 1.0 Fe in blast furnace practice.
0.15 slag to 1.0 Fe in proposed furnace.

Economy, 0.45 × 540 heat units = 243 heat units.

In the ordinary Bessemer converter the resulting carbonic oxide is wasted, and a large amount of heat is dissipated in the air by the escaping nitrogen and carbonic oxide.

If we take 0.225 carbon thus oxidized we have 0.525 carbonic oxide per ton of iron smelted + 1 05 nitrogen, and assuming in the Bessemer the gases escape at 900° C. instead of 300° C., the difference of temperature is 600° C.—*i.e.*, 1.575 × 0.245 × 600° C. =231 heat units lost.

2. The smelting will be much more rapid than in the blast furnace and would consequently decrease the loss of heat by transmission through the furnace walls, and one of the proposed furnaces will smelt more iron than any ordinary blast furnace.

3. Large quantities of rich gaseous fuel are liberated and afterward utilized, being invaluable for metallurgical purposes where high temperatures are required.

4. As small ore is preferred, poor ores can be crushed and enriched, or metallic sand, "blue billy" and other small ore can be utilized which does not find a ready market with blast furnace proprietors.

5. As iron is reduced at a comparatively low temperature and the fusion takes place at the molten bath, it is possible to use inferior fuel, taking care that same contains sufficient carbon for the operation, including any carbon required for driving off moisture, destructive distillation, &c., as well as for reduction of iron and fusion of iron and slag. For example, where coals are scarce and peat plentiful, the peat could be intimately mixed with the iron oxide and necessary basic fluxes. The alkalies present in the peat would assist to produce a liquid slag and the heat from the escaping gases would be utilized in driving off the moisture from the metaliferous peat briquettes.

For experimental purposes a simple and inexpensive furnace would be one similar to what was used in April, 1879, at John Brown & Co's Atlas Works, Sheffield, *vide* a paper read before the Society of Arts on April 30, 1879, "A New Application of Rapid Oxidation by which Sulphides are Utilized for Fuel," viz.: A cupola fitted with a Bessemer bottom. At the back of the cupola a forepart was built of fire brick connected with the cupola by an aperture in the side of the latter, in order that the molten material undergoing oxidation might freely communicate with a quiescent hearth. A drawing of this furnace will be found in the Society of Arts Magazine, May, 1879.

In the good old times I should not have contented myself with putting my crude ideas into writing, but preferably would have tried to confirm or rectify my opinion by experiments. To-day, unfortunately, I cannot afford to do this. May I hope that some good Samaritan Bessemer manager in the United States or elsewhere may consider it worth while to try the following simple but crucial experiment: Ram an ordinary Bessemer converter with a carbonaceous lining (composed of coal dust, bitumen and clay, coke the lining) and Bessemerize therein a charge of molten non-silicious iron, adding to the bath oxide of iron in small pieces, iron sand or "blue billy," together with an excess of coke. Weigh the iron before and after the operation. If it is found to have lost in weight it would appear as if no reduction had taken place, but if it had gained in weight it would prove that part of the oxide of iron had been reduced, and in that case I feel sure further more important experiments would follow and my theory would have a fair chance of being thoroughly thrashed out.

Apologizing for troubling you with so long a letter, I am, sir,

Yours faithfully.

JOHN HOLLWAY.

LONDON, September 16, 1893.

[We print the above letter as a matter of some interest, without indorsing its theoretical premises or assenting to the conclusions drawn from them.—*Editor The Iron Age.*]

David Bell of Buffalo, N. Y., who for 48 years has carried on a successful iron and steel shipbuilding works, has been forced to make an assignment to Thomas Macnoe. The shop has been reopened and will run full blast under the management of Receiver Macnoe.

OBITUARY.

PHILO BEVIN.

Philo Bevin, treasurer of the Bevin Bros. Mfg. Company, East Hampton, Conn., whose death occurred recently, was one of the pioneers in the manufacture of bells in this country. Mr. Bevin was born August, 1813, at East Hampton, and was thus an octogenarian at the time of his death. With two brothers he began the business in 1838, at East Hampton, the style of the firm having been Bevin Bros. In 1868 the business was incorporated under the name of the Bevin Bros. Mfg. Company. One of Mr. Bevin's brothers died in 1884, while the other brother survives him. The line of goods manufactured at the start consisted of sleigh, hand and house bells. A horse and tread-wheel furnished the power that was needed. In those days the facilities for shipping goods were very unsatisfactory and much energy and indomitable perseverance were essential to business success, qualities which Mr. Bevin possessed to a large degree. For six months in the year or more the goods were taken to a steamboat landing on the Connecticut River, three miles distant, for transportation to market; but when navigation closed a distance of 17 miles, and sometimes 25 miles, had to be traveled to reach a shipping point. Goods were shipped to New York, Boston, Philadelphia and Baltimore.

DELAVEN P. SMILEY.

Delaven P. Smiley, secretary and treasurer of the Michigan Foundry Company, and well known throughout New York and Pennsylvania, died at Battle Creek, Mich., on the 7th inst.

ARTHUR F. WENDT.

Arthur F. Wendt, the mining engineer, who died of disease of the kidneys on October 5, in Berlin, was the son of Charles E. Wendt. He was born in 1852 in Milwaukee. In 1873 he was graduated from the Columbia School of Mines and immediately began his career as an engineer in an iron mine on the Hudson. He was employed in turn at the antimony mines of New Brunswick, at iron and coal mines of Maryland and Pennsylvania, the manufacture of spiegeleisen, and at the copper mines of Tennessee and Arizona. In 1886 he was called to the silver mines of Potosi, and the Huanchaca silver mines of Bolivia. For the latter he designed and built a very large plant, the most prosperous in South America. It was there that he contracted the painful disease from which he died.

Washington News.

(*From our Special Correspondent.*)

WASHINGTON, D. C., October 9, 1893.

The chief constructor of the United States navy, Philip Hichborn, has completed his report on the work of the Bureau of Construction and Repair, of which he is the chief, and has submitted it to the Secretary of the Navy. This is the first annual report of this efficient officer of the navy since his assignment to the head of the Construction Department. He is undoubtedly one of the most accomplished officers in this branch of the service. In 1883 Secretary Chandler assigned him to the responsible duty of visiting the navy and ship yards of England, France, Germany and Russia and obtaining information and plans which might be utilized in the great work of rebuilding the American navy according to the latest methods and of modern designs and material. Mr. Hichborn prepared an elaborate report on the subject, which was really the foundation of the renaissance in American naval architecture. In a conversation with the correspondent of *The Iron Age* the Chief Constructor said:

The past year has been marked by the usual activity in the construction of the new ships. It has also been particularly characterized by visible results, as some of the larger ships which were commenced in 1891 and 1892 have been launched during the year. There are 20 vessels without the monitors undergoing completion, and more than one-half of these are now in the water.

We are constantly studying up new designs, but not with reference to any particular vessels until they are authorized by Congress, then we adapt all the best results of our labors in that direction to the class of vessel to be built. We have always plenty of time from the date of the authorization by Congress until the advertisements for contracts are prepared to make the plans and specifications.

The condition of the unfinished ships shows a satisfactory state of forwardness.

There are being Built in the Government Yards.

On the 17th of the present month proposals for the new gunboats will be opened. Two of the gunboats authorized are for Chinese waters and one for general service. Their designs will adapt them to the character of duty they are to perform. This will complete the list of vessels of all types authorized by Congress and uncontracted for. The "Brooklyn" and "Iowa," both armored vessels, have just been commenced and the contract with the Cramps requires their completion by July 1 and October 1, 1896, respectively.

Well, if the present Congress does not authorize more ships the navy yards will have to stop. The last of the large ships being built by the Department will be finished next year, but I have no doubt this Congress will authorize further additions in large and small ships in order to keep the work moving along steadily.

The Columbian Naval Review would have been practically impossible, as far as we were concerned, if we had not commenced when we did to build modern ships. We rather surprised the maritime nations of Europe with what we already had in the way of new, modern ships.

If the review had taken place next year instead of this, we would have surprised them more. Their chief officers, who keep in line with the naval progress of other countries, did not withhold expressing their surprise at what we had done. Less than ten years ago we had practically nothing. In the international review last spring we made a most excellent showing. We were not ashamed by any means of what we had to present.

The best tribute to the success of the United States Navy in marine design and construction in all branches, but particularly in the case I will mention in hull design and construction, was experienced this summer. Captain Wietrich, one of the chief constructors of the German Navy, spent more than a week in this bureau studying up our methods of designing and general administration of the Construction Department of our Navy. He said to me that it was the most perfect system in the world in scientific calculations, excellence of execution in designs, and perfection in methods. He could not adequately express his admiration of the delicate mechanism of detail which we applied. He left us in a most enthusiastic frame of mind over our American methods. Not long after I was astonished to find the German constructor back again. It appears that he had been to Berlin and made his report, which was so surprising to the German marine authorities that the Emperor ordered him back to make further studies of our system.

But this was not the only experience of this character. Among the distinguished foreign expert visitors to our bureau were Captains De Russy and Martine, chief constructors in the French Navy. They were a week with us, and went away full of compliments for the superiority of our system of administration in matters of construction over that of France and, so far as they knew, of other nations. We also had a Spanish naval constructor here, and this very day a Japanese naval officer called upon me with letters of introduction and requested permission to study our system.

These are only recent cases. The tide of inquiry is now coming from Europe to us, instead of our going to Europe. We to-day lead the pace of progress in naval architecture in the world. We will not only keep it, but if Congress authorizes the ships we will still further distance all competition and rivalry.

The explanation of our rapid advance is easy. In European naval establishments everything is secret; in fact, it is considered treason to give out any information. It is the reverse with us. We let the world know what we are doing. We invite criticism, and when they discover anything wrong they are quick to agitate it. We take all the expert journals in the world and have men employed to read them and report. So we have the best of other nations and profit by their criticisms.

I presume the Secretary will confer with the Senate and House committees and ascertain how much they are disposed to grant for new ships next year, and upon that will base his recommendations. This bureau is now equipped for any amount of new work Congress may see fit to authorize.

I am quite sure we can go beyond anything we have yet accomplished in this branch, and further astonish the maritime nations. There is no reason why we should not have within a few years the most formidable naval fleet on the globe. We have the national wealth, resources, materials, experience and expert skill.

Trade Publications.

WE HAVE RECEIVED from E. H. Kinsley & Co. of Cincinnati, Ohio, an illustrated catalogue of their supplies and machinery for railways, mines, machinists, mills, contractors, &c. The book measures 11 x 9½ inches and contains 1168 pages. Some idea of the field covered may be had from the fact that the index alone covers over 14 pages. Heavy, calendered paper is used, and the engravings are sharp and clear and well printed. The catalogue begins with a description of stationary and portable engines and boilers of different types, hoisting engines, ore crushers, rock drills, steam pumps, air compressors, planing and shaping machines, drills, lathes, milling machines, bolt cutters, pipe machines, wire straightening and cutting machines, shears and punches, presses, power hammers, bending rolls, boring machines, riveting machines, grinding machines, metal sawing machines, saw mill machinery, &c. There are also described small tools and fittings of all kinds. Considered as a whole, the catalogue is one of the most complete ever issued by a machinery supply house.

Port Royal, S. C., celebrates this week the introduction of direct steamship communication with Europe.

A Further Decline in Pig Production.

100,000 Tons per Week since June 1.

The general expectation that October 1 would witness an even smaller furnace capacity at work than September 1 has been fully realized, the anthracite furnaces this time being responsible for the greatest decrease. At the beginning of this month we were producing at the rate of say 3 850,000 tons per annum, against a normal rate of output of 9,000,000 gross tons. In other words, we are making considerably less than half the quantity of metal. The most discouraging fact is that consumption does not seem to proceed at a much greater pace, since our stock statistics indicate a slight gain rather than a decrease in accumulated supplies.

On October 1 the active furnace plant, grouped according to fuel used, possessed the following weekly capacity:

Fuel.		
Anthracite	34	15,338
Coke	52	53,061
Charcoal	28	5,496
Total, October 1	114	73,895
Total September 1	125	83,434
Decrease	—11	— 9,539

The weekly product of all the furnaces on October 1 compared as follows with that of preceding periods:

	Furnaces in blast.	Capacity per week. Gross tons.
October 1, 1893	114	73,895
September 1	125	83,434
August 1	169	107,042
July 1	220	153,762
June 1	244	174,029
May 1	251	181,551
April 1	255	178,858
March 1	255	176,978
February 1	251	171,201
January 1,	246	173,068
December 1, 1892	246	176,271
November 1	244	171,082

May 1	147	132,313
April 1	152	138,116
March 1	163	143,490
February 1	167	138,268
January 1	163	138,611
December 1, 1891	162	142,747

Considering the current state of affairs the Pittsburgh district has held its own in an astonishing manner. In fact, nearly one-half of the total production of coke iron in the country comes from Allegheny County. The Wheeling district, the Valleys, other sections of Western Pennsylvania, Northern Ohio, and above all Illinois, have all suffered far more. In Illinois, Wisconsin and Minnesota there was not a single coke furnace in operation on the 1st of the month. In Virginia, Alabama, Tennessee and Georgia, all of whose plants practically work for the open market, the product has dropped to a weekly rate of 15,068 tons in 22 stacks. Since the same section had 38 furnaces at work, with a weekly capacity of 24,142 gross tons, on June 1, 1893, it has not relatively dropped back as seriously.

Among the coke furnaces which have banked or blown out during September are: Niagara, in New York; Stewart, in the Shenango Valley: Rockbridge, in Virginia; two furnaces of the Illinois Steel Company, at South Chicago, and Phœnix, in the Mahoning Valley. There have been blown in during the same month one Maryland, at Sparrow's Point; one Cambria, at Johnstown; Franklin and Mingo, in Ohio, and Spathite, in Alabama.

The status of the anthracite furnaces was as follows:

Anthracite Furnaces, October 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York	18	1	559	17	6,094
New Jersey	11	2	956	9	3,841
Spiegel	3	2	137	1	118
Pennsylvania:					
Lehigh Valley	44	11	3,857	33	12,536
Spiegel	1	0	0	1	61
Schuylkill Valley.	27	10	5,138	17	7,210
U. Susquehanna Valley	14	2	712	12	4,275
L. Susquehanna Valley	17	2	1,652	15	5,490
Lebanon Valley	15	4	2,327	11	4,821
Totals	150	34	15,338	116	44,910

For a number of months past our records of active anthracite furnaces show the following:

	Furnaces in blast.	Capacity per week.
October 1, 1893	34	15,338
September 1	43	20,758
August 1	51	23,572
July 1	63	29,268
June 1	70	33,916
May 1	67	33,168
April 1	72	34,641
March 1	74	34,773
February 1	74	32,871
January 1	70	32,772
December 1, 1892	69	33,602
November 1	69	30,869
October 1	69	29,958
September 1	66	27,453
August 1	66	28,821
July 1	72	31,754
June 1	76	33,209
May 1	81	35,473
April 1	84	36,487
March 1	89	38,678
February 1	92	38,124
January 1	94	38,307
December 1, 1891	85	34,905

The number of furnaces at work has been lessened by the stoppage of Anvil and one Brooke in the Schuylkill Valley, one Allentown, two Bethlehem, one Crane and one Thomas in the Lehigh Valley.

Stocks.

The position of stocks, sold and unsold, as reported to us October 1, was as follows, the same furnaces being represented as in former months:

Stocks:	July 1. Tons.	Aug. 1. Tons.	Sept. 1. Tons.	Oct. 1. Tons.
Anthracite pig	114,955	111,468	115,930	121,597
Coke pig	344,138	420,390	513,260	532,157
Charcoal pig	193,629	191,838	197,881	179,908
Totals	652,722	723,696	827,071	833,662

The figures represent an increase in the accumulation of coke pig iron of nearly 19,000 tons during the month of September. Thus while the amount of stock continues to increase it will be seen that the rate of increase is not merely in proportion to that of the last few months. The gain has been general throughout the coke producing districts of the country with the exception of New York and Tennessee, where a decrease has taken place. The charcoal furnaces report a falling off in stocks of nearly 18,000 tons, while the anthracite producers have slightly increased their holdings.

MANUFACTURING.

Iron and Steel.

Several more sheet mills were put in operation last week at the plant of the Ætna-Standard Iron & Steel Company, Bridgeport, Ohio. All the sheet mills formerly included in the Standard plant are running except No. 9. The sheet mills of the Ætna works are not yet in operation. The three-high plate mill differences have been settled and it is now running.

At the works of the Whitaker Iron Company, Wheeling, W. Va., four sheet mills are now in operation. Repairs and alterations are being rapidly made on three others and a new mill is being built. This will make eight sheet mills at this company's plant.

All except two puddling furnaces of the Standard plant at Bridgeport, Ohio, now Ætna-Standard Iron & Steel Company, have been torn down to make room for other improvements.

At the Top Mill, Wheeling, W. Va., operated by the Wheeling Iron & Steel Company, the 52 inch sheet mill is in operation, also one small sheet mill, each running double turn.

The Bessemer steel plant of the Shenango Valley Steel Company, New Castle, Pa., has commenced operations after a prolonged shut down.

The New Philadelphia Iron & Steel Company, New Philadelphia, Ohio, have given notice of a 10 per cent. reduction in wages. All employees whose earnings are governed by the scale of the Amalgamated Association will be affected.

The hammer house of the W. Dewees Wood Company, McKeesport, Pa., which has been idle for several weeks, has resumed in full. The steel mill has also resumed after a week's shut down, so that almost the entire mill is now in operation.

The Chicago Steel Works, at Chicago Heights, Ill., have been purchased by Youngstown capitalists, who propose to complete the plant and have it in readiness for operation in about 60 days. The works have heretofore made a specialty of agricultural shapes, and they will probably continue in that line.

The Midland Steel Company of Muncie, Ind., enjoy the rare distinction of having been one of the few concerns in the entire country whose operations were uninterrupted by the recent panic. Their works are still running on full time in the manufacture of light and heavy steel sheets. The active demand for black sheets for tinning purposes is causing the company to regard that branch of the sheet business with much interest, and the probabilities are that they will shortly put themselves in a position to secure a share of it. Their equipment for this purpose lacks only the polishing rolls.

Trouble between the Indiana Iron Company of Muncie, Ind., and their old employees, whose faith is strong in union on the old scale of wages, has culminated in the importation of other labor. An impassable fence has been erected around the works, and it is stated that an electric current is passed through the wire that binds the fence boards whenever attempts are made to climb the barrier. This mill is outside the quarantined district.

Following the news contained in an item appearing in *The Iron Age* of last week concerning trouble over a reduction in the wages of wire drawers at the Salem, Ohio, works of the Salem Wire Nail Company, comes word that all employees in this department are discharged, and that they are endeavoring, without apparent success, to interest employees of other departments

Hosted by Google

with a view of causing a general strike. This company have another large plant at Findlay, Ohio, which they have successfully placed upon a non-union basis.

It has been rumored at Troy, N. Y., that I. Townsend Burden, Chester Griswold and Erastus Corning were to purchase the plant of the Troy Steel & Iron Company and run it. Receiver Kemp says that the syndicate mentioned has not approached him on the subject.

After an idleness of four months the Indiana Iron Company, one of the largest manufacturing concerns of Muncie, Ind., have resumed operation. It is stated that the workmen accepted a reduction in wages of 25 per cent.

On account of the breaking of a large cog wheel, causing a temporary suspension of work, it has been erroneously reported that the Ohio Falls Iron Works, at New Albany, Ind., have been closed down for an indefinite period. As a matter of fact, the works were closed for only one week and are now running to their full capacity. They have been running exclusively on orders for the last three months and have orders on hand sufficient to keep them going for some time to come.

Damage to the extent of $5000 was done to the works of the Windsor Locks Steel Company, at Windsor Locks, Conn., by the bursting of a 14-foot balance wheel weighing about 15 tons. The wheel was a new one and was being tested. The roof was torn off a portion of the works and a 55-foot smokestack knocked down.

At a recent meeting of the stockholders of the Pennsylvania Steel Company, held in the Philadelphia office of the company, the old Board of Directors was re-elected, and the number increased by the election of Effingham B. Morris, president of the Girard Trust Company, which corporation is one of the receivers of the Pennsylvania Steel Company.

The once great Vulcan Iron Works, at St. Louis, Mo., covering 6 acres of ground, are being sold piecemeal as junk. The 8-ton steam hammer was sold to Pittsburgh parties recently for $6000. Even the brickwork is disposed of to wreckers.

The court has granted to H. B. Oliver of Pittsburgh, Pa., the right to enter into an agreement with M. A. Hanna & Co. of Cleveland, Ohio, whereby the Oliver Iron & Steel Company and the Cleveland firm above named are to operate the Rosena Furnace, at New Castle, Pa., jointly. The Rosena has been practically rebuilt, and is now said to be one of the most complete and modern furnaces in the Shenango Valley.

The Philadelphia Bridge Works, at Pottstown, Pa., have started up on double turn, contracts having been received to keep them busy for some time.

The Susquehanna Rolling Mill of Columbia, Pa., has resumed work after a stoppage of some weeks.

Dora Furnace, at Pulaski, Va., has recently made some records that are believed by furnacemen to surpass anything in the South. She made during the month of August 4512 tons of iron on a fuel consumption of 2180 pounds of coke per ton of iron, of which 65 per cent. was foundry iron. Her record for the week ending September 23 was 1128 tons for seven days' work. That was made on a fuel consumption of 2000 pounds of coke per ton of iron, grading 93 per cent. foundry iron. Her best day's record was 206 tons.

After a shut down of several months the Old Dominion Nail Works on Belle Isle, at Richmond, Va., have resumed operations. The nail factory will resume during the week, together with the guide and bar mills.

The Carbon Steel Company of Pittsburgh have recently completed the erection of an electric light plant at their works.

Wm. Swindell & Brother, engineers and contractors, of Pittsburgh, have recentiy received a contract for the erection of a 24-pot crucible melting furnace at the tool steel works of the Collins Steel Company, at Collinsville, Conn. The same firm have also a contract for the erection of two additional Swindell annealing furnaces in the works of the Sterling Steel Company at Demmler, Pa.

A general reduction of wages averaging about 10 per cent. has gone into effect among the employees of Jones & Laughlins, Limited, at Pittsburgh. All classes of labor were affected except those working under the scales of the Amalgamated Association.

At Pittsburgh last week Charles A. O'Brien, acting for Pennock Brothers of Minerva, Ohio, filed in the United States Circuit Court an application for the appointment of a receiver for the Columbia Iron & Steel Company of Pittsburgh, with works at Uniontown, Pa. With the application is a petition asking that the judgments confessed last week to Robert Hogsett and the People's Bank, at Uniontown, be set aside. It is also charged in the bill that the officers of the firm are dissipating the property.

The Union Rolling Mills of Cleveland, Ohio, resumed operations last week to nearly their full capacity. It is stated that operations were resumed with the understanding that wages to be paid would be governed by those paid in same mills in the Mahoning Valley when operations there have been resumed. The number of heats per day to be made by the puddlers will also be regulated by the practice in the Mahoning Valley. For the present five heats in 12 hours will be the rule.

Employees of the Warren, Ohio, Rolling Mills, operated by the Union Iron & Steel Company of Youngstown, have been notified that their services are no longer required and they are advised to seek positions elsewhere. This mill has been ready to start at a day's notice for several weeks past, but failure to make satisfactory terms with the workmen has caused this action.

The Apollo Iron & Steel Company, at Apollo, Pa., have started up in nearly all departments with non-union workmen.

A press dispatch from Muscatine, Iowa, dated the 7th inst., says that on that day, amid the cheers of 3000 spectators the Williams Rolling Mills steamed up and rolled the first piece of iron. The concern will employ 200 to 300 skilled laborers. It was built by citizens of Muscatine through the Improvement Company.

The puddle mill of the Phœnix Iron Company, Phœnixville, Pa., has resumed operations.

The plate mill of the Ellis & Lessig Iron and Steel Company, at Pottstown, Pa., has resumed operations, the employees agreeing after a conference to accept the reduction until the return of better times. They are to work five days a week and three weeks a month. The puddlers have not yet decided to accept the proposed reduction in their wages.

Another of the furnaces connected with the pipe mill of the Reading Iron Company, Reading, Pa., has resumed operations, giving employment to 75 more hands. It is stated that the prospects for an early resumption of the entire mill are excellent.

The puddling and the steel rail departments of the Bethlehem Iron Works, Bethlehem, Pa., will, it is stated, resume work on Monday next. They have been idle several months. Fifteen hundred men will be given work.

After two months of idleness the rolling mill of the Valentine Iron Company, Bellefonte, Pa., has again been put in operation.

In all probability the Clinton Iron & Steel Company will endeavor to start up their Clinton Rolling Mill on the South Side, Pittsburgh, with non-union men during this week. Although the scale of the Amalgamated Association calls for $5 per ton for boiling this firm state that they are unable to pay this price and compete with non-union mills in Pittsburgh, where the price is 50 cents per ton and in some cases $1 per ton less. It is stated that the firm have secured a large force of non-union men, sufficient to start up the puddling department some time during this week.

During this week the Homestead Steel Works, Homestead, Pa., will operate according to this schedule: Armor plate, open hearth, converting mill, 28-inch plate mill and the 10-inch mills will be on double turn. The 23, 32, 35 and 40 inch mills on single turn.

Keystone Furnace, at Chain Dam, Pa., owned by the Thomas Iron Company, was blown out last week.

The Apollo Iron & Steel Company, Pittsburgh, Pa., have withdrawn as members of the Association of Iron and Steel Sheet Manufacturers with headquarters at Pittsburgh. This step was taken for the reason that this firm have decided to employ only non-union labor in the future. When the wage scale governing sheet mills adopted in Pittsburgh in July last was presented to the employees of this firm, some of them refused to be governed by it. In addition to this, when the manufacturers asked that a vote of the lodges of the Amalgamated Association be taken as to whether they would agree to reconsider the wage scale, the request was refused, although it has since been decided to have the different lodges vote on the question. On Monday, the 9th inst., two mills of the above firm at Apollo, Pa., were put in operation, and on the day following another was started up. It is the intention of the firm to operate only such portions of their plant as their trade requires. In the future they will deal with their employees as individuals and no labor organizations of any kind will be recognized.

The Totten & Hogg Iron and Steel Foundry Company, Pittsburgh, Pa., report trade as improving, having recently received a number of orders for rolls and rolling mill machinery. On Monday this firm received an order from one concern for 30 rolls. This would seem to indicate that in some sections, at least, business is improving.

Machinery.

Among orders received by A. L. Ide & Son of Springfield, Ill., during the last ten days are the following: One 100 horse-power Ideal engine for the Ludington Building, second order; one 125 horse power engine for the Hoopeston Canning Company, Hoopeston, Ill.; three 175 horse-power Ideal tandem compound engines for the new Stock Exchange Building, Chicago; two 125 horse-power and one 100 horse-power Ideal engines for the Southern Hotel, St. Louis. The Stock Exchange and the Southern Hotel engines are all to have General Electric Company multipolar armatures directly attached to their crank shafts, the stock Exchange engines driving 100 K. W. machines and the Southern Hotel engines driving 50 K. W. machines. The two 125 horse-power engines each drive in addition one 50 arc light dynamo bolted from its governor pulley.

The newly incorporated firm of Harrington, Son & Co., Philadelphia, will erect a large machine plant.

The Lehigh Valley Railroad shops, at Easton, Pa., are now working full handed on full time.

Frisbie Elevator & Mfg. Company, New Haven, Conn., have recently put in what is said to be one of the largest electric elevators ever built. It is located in the car house of the Consolidated Street Railway Company, Worcester, Mass., and is used for elevating cars. Its capacity is 9 tons, with platform 34 x 10 feet and 15 feet high.

The W. H. Page Boiler Company of Norwich, Conn., have completed plans for a new foundry, which they propose to build in connection with their present plant, to accommodate increasing business.

The machine shops of the Southern Pacific Railroad Company, which for some time past have been working but four days per week and eight hours a day, are now running on full time with a full force.

The Hay Budden Mfg. Company of Brooklyn, N. Y., have been incorporated to manufacture and sell dies and anvils and carry on a general forging and blacksmithing business. The capital is $20,000.

The National Iron Works and the Vulcan Brass Works, at Cleveland, Ohio, have been damaged by fire, the former sustaining a loss of $7000 and the latter $4500.

John Adt & Son, well-known builders of machinery at New Haven, Conn., are operating their plant with about one-quarter of their usual force, eight hours a day and six days a week. While the tone of business with them has considerably improved during the last month, they do not look forward to any considerable improvement in the situation until Congress takes action on the tariff question.

The Birmingham Iron Foundry, founders and machinists, Birmingham, Conn., continues to run six days a week, with nearly a full complement of hands. The company are troubled with slow collections, but otherwise the outlook with them is quite satisfactory under the circumstances.

Thurman & Powell, machinists and foundrymen of Louisville, Ky., have assigned. The assets are $36,468.29, and the liabilities $31,401.49.

The Swamscot Machine Company of South Newmarket, N. H., doing business in Boston under the firm name of George K. Paul & Co., have assigned. It is hoped to pay creditors in full, and to continue the plant in operation, which gives employment to practically the whole town of South

Hosted by Google

Newmarket. The company's assets consist of bills receivable and cash amounting to $81,500; real estate, tools, machinery, &c., $110,000; stock in trade in store in Boston, $66,000. The debts amount to $140,000. The directors' object is to realize the best possible price on the stock in the store in Boston, pay up the debts and thus free the corporation at South Newmarket.

The Finance Committee of Montreal, Canada, have recommended to the Council the purchase of a Worthington high duty pumping engine having a capacity of 12,000,000 United States, or 10,000,000 Imperial gallons of water per 24 hours. The Worthington Company offer to deliver and install within 60 days from the closing of the World's Columbian Exposition the pumping engine now on exhibition at the fair for the sum of $55,000. The engine in question is of the same type and capacity as the one already in operation at Montreal, so that the water capacity of that city will be doubled.

The Christopher Double Power Rotary Engine Company have been incorporated at Spartansburg, S. C., by C. E. Christopher, S. Wilson and associates, with a capital stock of $1,000,000, to establish engine works.

The Robingson Mfg. Company, operating a brass foundry at Beaver Falls, Pa., have not gone into a receiver's hands, as stated in recent press dispatches. The report grew out of the fact that a receiver has been appointed for the concern owning the building in which the company carry on their business.

The Kitson Machine Company of Lowell, Mass., have laid off 26 of their employees owing to dull business.

The American Road Machine Works of Kennett Square, Pa., have closed for an indefinite period, throwing out of employment about 200 men. This is the first time in years that the works have been forced to close on account of a lack of orders.

The Northwestern Malleable Iron Works, at Milwaukee, Wis., which closed down about two months ago on account of lack of orders, have resumed with a full force. It is understood that the works have a number of good sized orders on hand.

Hardware.

The cutlers of the Humason & Beckley Mfg. Company, New Britain, Conn., have resumed work.

The nailers and the Laughlin Nail Company, Martin's Ferry, Ohio, have come to an agreement, the former accepting the 15 per cent. reduction in wages proposed by the company. The works are again in operation, giving employment to nearly 700 hands.

The implement works of the Parlin & Orendorff Company, Canton, Ill., have resumed work with 800 employees.

The Parker Mills Nail Works, Wareham, Mass., which have been idle for six weeks, have started up.

The Eaton-Ritchell Company, manufacturers of tinware, Denver, Col., have decided to remove to South Omaha, Neb., and will commence the erection of a plant at that point at once. The building will be 60 x 190 feet and will cost about $6000. The firm will give employment to 50 men.

The American Wringer Company's plant at Woonsocket, R. I., which has been running three days a week during the past two months, will probably start in on full time in a few days.

G. W. Denison & Co., Winthrop, Conn., manufacturers of wood planes, are closing out their business.

The Hatch Cutlery Company, South Milwaukee, Wis, and 97 Chambers street, New York, are congratulating themselves on the amount of Christy knives sold since they undertook to market the entire output in July last. They refer to the aggregate number of sets disposed of since that time as 10,000, and assure us they are making an effort to execute orders promptly.

The new nail factory of the Hollis Tack & Nail Factory, at Scottdale, Pa., was put in operation on September 15, giving employment to about 25 men and boys. The factory is equipped with 30 tack and nail machines, 20 of them being in operation. The firm expect to start up the balance about November 1 next. The concern advise us that they are meeting with a good demand for their nails, and expect to secure a fair share of the trade. The concern have a capital stock of $20,000, with officials as follows: W. A. Kifer, president; F. M. Branthoover, secretary, and John Robertson, treasurer.

TRADE REPORT

The terrific struggle for work continues, and on large orders accompanied by satisfactory terms of payment unprecedented prices are made. The sacrifice of all profits along the whole line, the low cost of raw materials and the reductions in labor have brought down the theoretical cost of manufacture to figures hitherto undreamt of in this country. We say advisedly "theoretical," because it is dependent upon full employment. To reach the condition begotten by a fairly well filled order book is what so many are striving for. Spot cash, too, fetches very low figures. In fact, the terms are so potent a factor now that reports as to prices accepted for prompt settlement are no criterion as to what could be done on transactions on the ordinary basis. This fact must be kept in mind steadily.

If the Rockefeller interest can buy 300,000 tons of Mesaba Ore, delivered at lower Lake ports, at $2.75, cash, it does not follow that contracts can be placed at that figure at other terms. Although a Cleveland mill did buy 12,000 tons of Steel Billets for $17.50, cash, on cars Pittsburgh, a small consumer cannot do better than $18 25, ordinary terms. Coke at $1 ℔ ton at Connellsville, even, might possibly be done under special circumstances, but the open quotation is $1.10. In the same way special prices are being made for Finished Material, as in the case mentioned by our Philadelphia correspondent. But the circumstances surrounding the transactions are such that very few can avail themselves of them, however much many might be willing to do so.

Our monthly Pig Iron statistics reflect as closely as it is possible for any one article in the line of Iron products to do so the volume of current consumption. They show that we are still accumulating a little metal in spite of the fact that current production is only 43 per cent. of the normal output of say 9,000,000 tons per annum.

Bessemer Pig is down to $11.50 in Pittsburgh, and even $11 25 has been done under special circumstances. Costs have changed so much lately that manufacturers are quite at sea concerning the capacity of rivals to live at low figures. There is a good deal of discussion going on whether $6, $6.50, or $7, or $7.50 are a fair representation of cost of converting Pig Iron into Steel Billets. Some very emphatic statements are made concerning the claims of those who assert that the lower figures represent actual practice. In a similar way the controversy is raging over the cost of rolling Billets into Rods, and over other similarly perplexing questions.

In a general way the conclusion is warranted that very few of the works throughout the country can touch the costs proclaimed by some, and that therefore any inferences based upon them as to the permanency of present values are dangerously unsafe to the buyer. That lasting reductions in the cost of producing Iron and Steel have been made no one will deny, but neither labor nor capital can long suffer as they are now doing. The present range of values is abnormal and cannot last long. Even now far more than half of the aggregate manufacturing capacity is helplessly out of the race. When consumers need their product they will have to accord prices which will pay them to start.

Chicago.

(By Telegraph.)

Office of *The Iron Age*, 59 Dearborn street, CHICAGO, October 11, 1893.

Pig Iron.—The past week has been quiet, with not even a rumor of a large sale. Inquiries have fallen off. The few transactions reported in Coke Iron are principally in Southern brands. Southern manufacturers are, however, quite stubborn about long deliveries, and claim that they will sell only at present rates up to the first of the year. For delivery beyond that time they ask more money. The situation is regarded by prominent dealers as one of waiting on the part of buyers. They believe that nothing favorable or unfavorable can be based on present conditions. Consumers are wholly at sea regarding the future, and not knowing what to do they naturally do nothing. If the Senate soon settles the silver question by the passage of the repeal bill it is expected that there will be some resumption of activity. Meanwhile everything hesitates. Quotations are now as follows for cash:

Lake Superior Charcoal.....	$16.00 @	$16.50
Local Coke Foundry, No. 1...	13.50 @	14.00
Local Coke Foundry, No. 2...	12.75 @	13.00
Local Coke Foundry, No. 3...	12.50 @	12.75
Local Scotch.....	14.00 @	14.50
Ohio Strong Softeners No. 1..	15.50 @	16.00
Southern Silvery, No. 1.	@	14.50
Southern Silvery, No. 2.....	@	14.00
Southern Coke, No. 2..... ...	12.35 @	12.60
Southern Coke, No. 3	11.60 @	11.85
Southern, No. 1, Soft.....	12.35 @	12.60
Southern, No. 2, Soft.....	11.85 @	12.10
Southern Gray Forge	11.10 @	11.35
Tennessee Charcoal, No. 1....	16.00 @	16.50
Alabama Car Wheel.....	18.50 @	18.75
Hocking Valley, No. 1	15 25 @	16.00
Jackson County Silvery.....	16.00 @	17.00

Bars.—Transactions recently have been confined to small quantities of Bar Iron and Soft Steel Bars. The volume of business is, however, a little larger than for some time past, as shown by the ability of local mills to continue in operation. Prices of Bar Iron range from 1.40¢ to 1.45¢, half extras, Chicago delivery. Soft Steel Bars are generally quoted at 1.55¢, Chicago, but good specifications can be placed at a little lower figure. Store prices are unchanged at 1.65¢ @ 1.70¢ for Bar Iron and 1.70¢ @ 1.75¢ for Soft Steel Bars.

Structural Material.—Only sales of small lots are reported. Quotations are maintained at the following prices on mill shipments, Chicago delivery: Beams, 1.75¢ @ 1.90¢; Tees, 1.95¢ @ 2.05¢; Angles and Universal Plates, 1.75¢ @ 1.80¢.

Plates.—Nothing new is to be noted under this head. Only a moderate business is in progress in mill shipments, while store trade is about as reported last week. Mill shipments, Chicago delivery, are quoted as follows: Tank Steel, 1.75¢ @ 1.80¢; Shell Steel, 2¢ @ 2.10¢; Flange Steel, 2.15¢ @ 2.30¢; Fire Box, 2.75¢ @ 5¢. Store prices now prevail as follows: Iron or Steel Sheets, Nos. 10 to 14, 2.25¢ @ 2.40¢; Tank Steel, 2.10¢ @ 2.20¢; Shell Steel, 2 20¢ @ 2.40¢; Flange Steel, 2.50¢ @ 2.65¢; Boiler Tubes, 67½ %.

Sheets.—The mills manufacturing Black and Galvanized Iron are now a little firmer in their views. This is perhaps owing to the fact that orders are being concentrated with the mills now running. Quite a number of contracts have been canceled with idle mills and replaced with those able to make prompt shipments. The minimum price of mill shipments now seems to be 2 80¢, Chicago, for No. 27 Common Black Sheets and 75 % for Juniata Galvanized, with

Hosted by Google

freight added. Small lots from stock are selling at 2.90¢ @ 3¢ for Common No. 27 Sheets and 70% @ 70 and 7½ % off for Galvanized Iron. Sheet Copper continues to be quoted at 30 % @ 35 % off, according to quantity.

Merchant Steel.—Specifications are coming in more freely on season contracts. Orders for prompt shipment, although small, are also better than they have been. General consumers are buying better, showing that their stocks are running out and must be replenished. Mill shipments, Chicago delivery, are quoted as follows: Smooth Finished Machinery, Tire and Open Hearth Spring Steel at 1.90¢ @ 2¢; Ordinary Bessemer Machinery, 1.60¢ @ 1 65¢; Ordinary Bessemer Tire, 1.55¢ @ 1.60¢; Ordinary Tool Steel, 6¢ @ 7¢; Specials, 12¢ and upward.

Rails and Track Supplies.—The Steel Rail situation is unchanged, business being light on standard sections, but moderately active on Light Rails. Standard sizes are unchanged at $30 @ $32; and Light Rails $31.50 @ $32. Iron and Steel Splice Bars 1.60¢ @ 1.65¢; Track Bolts with Hexagon Nuts, 2.50¢ @ 2.55¢; Spikes, 1.85¢ @ 1.90¢,

Old Rails and Car Wheels.—Offers are made of $14.50 @ $15 for Old Iron Rails, but the railroads ask $16 and more, so that no trade has resulted. Old Steel Rails are quoted at $8 @ $10, according to length. Old Car Wheels are in no demand, and it is difficult to determine values. Large lots would be taken by some buyers at $10 @ $10.20, who deem Old Wheels at such prices a good speculation. Single carload lots command $13.50 @ $14.

Scrap.—Inquiries are coming in from distant points, but buyers appear to be unwilling to pay Chicago prices. The local demand is light. The demoralization of prices is shown by the amount realized on a carload of low grade Scrap sold under some pressure last week. It netted the seller only 64¢ ℔ ton. Dealers' selling prices, net ton, are as follows: No. 1 Forge, $10; No. 1 Mill, $8; Sheet Iron, $5; Pipes and Flues, $7 50; Axles, $15; Horseshoes, $10; Fish Plates, $12 75; Spikes and Bolts, $10; Cast Borings, $5; Wrought Turnings, $6.50; Axle Turnings, $8; Heavy Cast, $9; Stove Plate, $7.75; Malleable Cast, $8; Mixed Steel, $9, gross ton; Leaf Steel, $16.

Metals.—Carload lots of Lake Copper are quoted at 10⅞¢. Casting brands are still held at 9⅞¢, but trade continues dull. Spelter is lower. It has sold at 3 55¢, but can possibly be bought now a trifle below that. Lead has fallen to 3.45¢ in carload lots. Some sellers have endeavored to force their holdings on the market, while buyers are not disposed to take much at present.

George G. Spencer, 553 The Rookery, Chicago, has been given entire charge of the sales department of the Cambridge Iron & Steel Company, Cambridge, Ohio. The company manufacture light Iron and Steel Sheets exclusively. They have recently added a galvanizing department, and manufacture Galvanized Sheets under two brands, Cambridge and Cambridge Best. Mr. Spencer has had much experience in the Sheet trade, having represented the Ætna Iron & Steel Company for eight years, during which time he built up a large business in that line. In addition to the management of the sales department of the Cambridge Company, Mr. Spencer will continue his connections in other branches of trade.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., October 10, 1893.

The condition of the market is much the same as last week, although there is a more hopeful feeling and a disposition to act on the idea that things are going to be better. Prices are extremely low, and with but few exceptions are lower than they were a week ago, although this is measurably offset by cheaper cost, so that averaging it all around the trade are inclined to accept the situation as giving promise of improvement, especially as there is a better demand and a better outlook generally. Inquiries are more numerous and money is easier, and with a continuance of favorable conditions during the next two or three weeks business ought to resume some of its old time activity. Until that time it is hardly to be supposed that prices will show much change, although they must be pretty well down to bed rock. A few large orders have been taken for Pig Iron, and some good sized lots of Finished Material have also been placed; but nothing encouraging can be said in regard to the prices that were realized. This, indeed, is the most unsatisfactory feature of the market, but for the time being competition is so sharp that anything out of the ordinary run of business is jumped for almost without regard to prices.

Pig Iron—This end of the market is about as dull and uninteresting as it possibly can be. Buyers appear to be utterly indifferent to low prices; if they need Iron they will order just a little; if they do not need it, price is no inducement. Sales therefore are to a great extent carload lots, 50 tons or 100 tons, and occasionally it may be a 200 or 300 ton lot at quoted rates, but on a larger lot special terms must be arranged, either by a concession in price, time for delivery, or in terms of payment. The fact is, buyers have everything their own way, and while there is no undue pressure to sell, all that a buyer needs to do is to signify that he wants Iron, and the supply of all kinds and from all quarters is immediately seen to be abundant. All the same, it is a frequent remark that some of these days—and perhaps very soon, too—there will be a change of tone, but in the meanwhile it is equally true that there is no disposition to anticipate such a contingency, which, however, only serves to make it more of a probability. Sales are usually within the following range of prices, varying according to quantity, brand, delivery, terms of payment, &c.: $12.25 @ $12.75, delivered, for Gray Forge or Plain No. 2; $13.75 @ $14 for No. 2x; $14.25 @ $14.50 for No. 1x.

Steel Billets.—Business is not large, although prices are again lower, $20.75, with a chance that $20.50 or less would be accepted on a firm offer for a round lot, quick delivery and prompt cash settlements. A few small lots have been taken at $21 @ $21 25, but there is not much disposition to do business, although one or two lots of importance are under negotiation and will probably be closed in a day or two at something less than $20.75.

Finished Material.—A more active demand is reported, and of a pretty well distributed character, but with so many mills looking for work, inquiries are in many cases little more than an incentive for manufacturers to name lower prices than ever. The past week has probably seen the lowest figures yet reached, but at this writing there would be no difficulty in duplicating any purchase recently made. Ordinarily prices on small lots are not greatly changed from last week, but on 50-ton orders, or from that up, extraordinarily low figures are named, figures which can hardly be given in print without leading to misapprehension among the smaller class of buyers. The reason given for such tremendous cuts in prices is that the large mills are determined to get all the work possible, so that when the order is large enough to make it worth while, prices are slaughtered most unmercifully. The 3000-ton order taken by the Phœnix Bridge Company last week is a case in point, Pittsburgh furnishing the plates, the Phœnix Iron Company the balance of the material. There are other orders of this class likely to be around soon, particularly for architectural work and shipbuilding, but at best there is not likely to be more that sufficient to maintain the *statu quo*. Still it is something to feel that matters are not likely to be worse, with some chance for a moderate improvement. General quotations are about as follows, with the usual concessions on large lots:

Grooved Skelp, delivered	1.50¢	@	1.55¢
Best Refined Bars	1.55¢	@	1.60¢
At interior points	1.50¢	@	1.55¢
Tank Steel	1.60¢	@	1.65¢
Heavy Plates	1.65¢	@	1.70¢
Shell	1.75¢	@	1.85¢
Flange	2.00¢	@	2.20¢

Old Material.—There is very little disposition to buy, so that prices vary according to the desire of the holder to realize. As a rule asking prices are about as follows:

No. 1 Wrought Scrap, delivered	$12.50	@	$13.50
Machinery Cast, delivered	10.50	@	11.00
Heavy Steel Scrap, delivered	13.00	@	14.00
Old Iron Rails, delivered	15.00	@	16.00
Old Street Rails, delivered	17.00	@	18.00
Wrought Turnings, delivered	10.00	@	11.00
Cast Borings, delivered	6.50	@	7.00
No. 2 Light Scrap, new	8.00	@	8.50
No. 2 Light Scrap, old	6.00	@	7.00

Cincinnati.

(By Telegraph.)

Office of *The Iron Age*, Fifth and Main Sts., CINCINNATI, October 11, 1893.

The market has been unusually dull for Pig Iron during the past week, even for these dull times. There has been about the usual current consumptive demand in this district for car lots, but they seldom run above 200 tons each; and even the orders from the East have been for reduced quantities, and notwithstanding the comparatively light offerings of Southern Iron there is an ample supply for the wants of the trade. The stove works in this district are buying generally in a small way, and while prices as a rule are sustained there have been concessions made in some instances. 1000 tons Gray Forge was sold on competitive bids which resulted in the price being made of $6.75 ℔ ton, f.o.b. Birmingham, for deliveries running up to March, and while this is considered exceptional it indicates that there are still sellers to be found at low prices. The current demand is mainly for No. 2 Foundry and No. 1 Soft, and for these pretty full quotations are realized. There appears to be no movement in Charcoal Iron. Collections are not improving much, if any; better things are

Hosted by Google

expected when the Silver Purchase bill is repealed. Quotations are as follows:

Foundry.

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke No. 1	15.00 @ 15.25
Lake Superior Coke No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Forge.

Gray Forge	9.75 @ 10.00
Mottled Coke	9.50 @ 9.75

Pittsburgh.

(By Mail.)

Office of *The Iron Age*, Hamilton Building, PITTSBURGH, October 10, 1893.

As the end of the year approaches the conviction becomes general that no permanent improvement in the Iron and Steel trades can be reasonably expected before next year. While prices on all kinds of material are much lower than ever before, business is confined to sales for immediate requirements, and when a large order is placed, it is for the reason that the buyer is offered an exceptionally low price, at which he feels he can afford to take the risk of further decline in the market before he is ready to enter it again. Going right through the list of Iron and Steel manufactures it would seem that prices cannot reasonably go any lower, and yet, when an attractive order is presented there is such a scramble for it that values are sent a peg lower, and it is a wise man, indeed, who can state at which point the line will be reached and the downward tendency checked. During the past three months Pittsburgh has set the pace in offering attractive prices, and makers both East and West have been compelled to drop out. However, when prices at which certain contracts have been taken are considered, it is evident at once that cost mark has been reached and gone under in many instances. The determination of large concerns to get enough business to keep in operation is, of course, responsible for this state of affairs. For the week under review prices have shown a further decline in some lines. Bessemer Pig has touched $11.50, Pittsburgh, while $18 on Billets, which was an inside price at our last report, has been materially shaded in a large block for balance of the year's delivery. Coke is freely offered at $1.10 in Connellsville region, and the days of dollar Coke are not far off, if they are not already here.

Pig Iron.—The market is about as dull as it is possible for it to get, and with more Iron being made than is being used there does not seem to be any hope of improvement for some time. At furnaces in the Pittsburgh district, and in the valleys as well, large stocks of Iron are piled up, and these are being depleted very slowly, owing to the light demand. At no time in the Iron business have makers been able to turn out product as cheaply as at the present time, but in spite of this it is somewhat doubtful if Bessemer Iron can be made at a cost of $11.25 ₱ ton at furnace, at which price a transaction is reported to have been made last week. For ordinary lots ranging from 100 to 500 tons the following figures prevail, but on good sized blocks, with favorable time of payment, it is altogether probable that concessions would be offered. We quote as follows:

Neutral Gray Forge	$10.75 @	$11.00,	cash
All-Ore Mill	11.00 @	11.25	"
Bessemer Pig	11.50 @	11.75	"
No. 1 Foundry	12.75 @	13.00	"
No. 2 Foundry	11.75 @	12 00	"
Charcoal Foundry No. 1	14.00 @	15 00	"
Charcoal Foundry No. 2	13.00 @	14.00	"

We note a sale of 500 tons of All-Ore Mill Iron for October delivery at $11, Pittsburgh; also a sale of 2000 tons of Bessemer, for October and November delivery, at a price equal to $11.60, Pittsburgh.

Billets.—Within the past week Steel has been sold at $18.25 at maker's mill, and it would no doubt require a very desirable order to shade $18 at mill. As to whether the price referred to above would be duplicated for a similar order is also uncertain. For ordinary business the market is represented by the quotation of $18 @ $18.25 at maker's mill.

Muck Iron—There is very little demand and offers to sell on the basis of $20.50 at buyer's mill have been declined. However, it is believed that it would require a very desirable order to shade this price.

Wire Rods.—Rod mills for October are pretty well fixed for business, and for delivery this month Rods are held at about $27.50 at maker's mill. For delivery in November and December $26 at maker's mill has been asked.

Ferromanganese.—We make nominal quotation of $55 @ $56 at maker's mill for domestic. We have not been advised of any sales for some time.

Finished Material.—New business being offered continues small, and the outlook for improvement is not bright. Pittsburgh is credited with taking an Eastern order for Flange Steel at a price considerably lower than has yet been touched. There is a fair inquiry for Beams in small lots, but no large orders have been placed for some time. For ordinary lots prices quoted last week continue to rule, but, as stated before, for desirable business our lowest quotations continue to be shaded to a considerable extent. We quote as follows: Beams up to 15-inch, 1.60¢ at maker's mill; Angles and Universal Plates, 1.60¢ @ 1.65¢; Tees, 1.65¢; Tank, 1.55¢ @ 1.65¢; Flange, 1.80¢ @ 1.90¢; Shell, 1.65¢ @ 1.75¢; Fire Box, 2.50¢ @ 5¢, according to quality; Machinery Straightened Tire Steel, 1.75¢ @ 1.85¢; Toe Calk, 2¢ @ 2.10¢; Open Hearth Spring, 1.90¢ @ 2¢; Bessemer Machinery, 1.75¢; Steel Bars, 1.35¢ @ 1.40¢ at mill, with Bar Iron extras. Bars in the Mahoning Valley are held at 1.35¢ @ 1.40¢, half extras, according to order. Sheets are ruling as follows: Soft Steel Sheets, No. 24, 2.45¢; No. 26, 2.55¢, and No. 27, 2 65¢.

Barb Wire.—The demand continues light, and this, in connection with the decline in Steel and the desire of the makers to push sales, has weakened prices to some extent. We quote Four Point Galvanized at $2.25 at maker's mill in carload lots, while jobbers are charging $2.35 @ $2.40 for lesser quantities. Painted we quote at 40¢ less than above prices. Plain Wire is also quiet, and we quote at $1.50 at mill for fair sized orders.

Wire and Cut Nails.—Both Wire and Cut Nails are in better demand, and mills are fairly busy. The outlook for the future is bright, as it is claimed that never before in the history of the trade have stocks been as low as now. We quote Wire Nails at $1.25 @ $1.30 for carload lots, while jobbers are getting $1.35 @ $1 40 from the smaller trade. We quote Cut Nails at $1 for carload lots at mill. For an order with good average this price would probably be slightly shaded.

Coke.—Prices of Connellsville Furnace Coke have further weakened and it is now being offered at $1 10 at ovens. For the week ending Saturday, September 30, there were 5397 ovens in blast and 11,993 idle, with a total estimated production of 48,060 tons. We quote Furnace Coke at $1.10 in tons of 2000 lb, f.o.b. cars in Connellsville region. Foundry Coke we quote at $1.50 to dealers and $1.65 to consumers.

St. Louis.

(By Telegraph.)

Office of *The Iron Age*, Bank of Commerce Building, ST. LOUIS, October 11, 1893.

Pig Iron.—A report of the Iron market for the past week is necessarily a repetition of the week preceding. Sales are limited to carload quantities, and prices, while unchanged, are inclined to weakness. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$13.25 @ $13.50
Southern Coke, No. 2 Foundry	11.75 @ 12.00
Southern Coke, No. 3 Foundry	11.00 @ 11.20
Southern Gray Forge	10.50 @ 10.75
Southern Car Wheel	17.50 @ 18.00
Lake Superior Car Wheel	16.75 @ 17.25
Ohio Softeners	16.00 @ 16.50
Missouri Charcoal, No. 1 Foundry	13.00 @ 13 50

Bar Iron.—The demand fails to show any material improvement and is largely spasmodic in its character. Jobbers are also feeling the dullness. Mills quote 1.50¢, half extras, f.o.b. cars East St. Louis. Jobbers ask 1.65¢ @ 1.70¢ for lots from store.

Barb Wire.—Mills are running full and report a steady trade. Jobbers are also in receipt of some good sized orders. Mills quote $2 for carload lots of Painted to jobbers, and Galvanized at $2 40. Jobbers ask $2.10 @ $2.15 for Painted, and Galvanized at the usual advance.

Wire Nails.—There is an increased inquiry for Wire Nails, and both mills and jobbers are having a good run of trade. Prices seem to be a trifle heavy and, while not quotably lower, are not held quite so firm as last reported. Mills quote $1 55 in carload lots to jobbers, and store price is $1.60 @ $1.65.

Rails and Track Supplies.—A slight improvement is noticeable in Track Supplies. Splice Bars are quoted 1.65¢ @ 1.70¢; Spikes, 1.95¢ @ $2; Bolts, Square Nuts, 2.50¢; with Hexagon Nuts, 2.60¢. Steel Rails are nominally $30 @ $31. Old Iron Rails are quoted at $15, a 100-ton lot changing hands yesterday at that price.

Pig Lead.—Continued weakness is noted in this metal, which is now quoted at 3 35¢, with moderate offerings and practically no sales.

Spelter.—There are no buyers in the market and Spelter is nominally quoted at 3.40¢. The consumptive demand has dwindled down to almost nothing, and with the exception of an occasional carload business is practically dead.

Hosted by Google

Metal Market.

Copper.—There has been freer offering of Lake Superior Ingot by some of the smaller producers and by dealers, the outcome of which is reflected in a decline to 9¾¢ as common selling price. Some of the larger producers claim to be sold ahead, and therefore place their quotations at 9⅞¢ @ 10¢, but it is an open secret that at least 250,000 pounds have been sold at 9¾¢, regular terms, and that offers were made openly at 9.70¢ on the Metal Exchange for deliveries running through the balance of the year. The cheaper varieties have fared no better. Electrolytic may easily be secured at 9⅝¢ @ 9⅞¢, and sales of common casting stock at above 9¾¢ are the exception at present. In fact, it is intimated that those figures have been shaded, and that the general market is weaker below than above the sarface, despite quite free movement of stock from this to European points of late.

Pig Tin.—There has been a reverse movement in the price of this metal, the outcome of pressure by operators who have latterly figured with more or less prominence as "bears" in the speculative line and lack of support from the opposing interest. Comparatively little Tin has changed hands in a speculative way, however, except perhaps on old contracts, but the movement of stock into the channels of consumption has continued nearly up to the average for the season and the statistical position is stronger, if anything, at the present time, than it was prior to the reaction. However, the "bear" interest forced a decline of about 0.35¢ @ 0 40¢ in prices, carrying Straits to 20 65¢, regular terms, and 20.50¢ for immediate cash payment. At the close of the week under review the market was a trifle firmer, with 20.70¢ bid for current month delivery.

Pig Lead.—Prices have undergone a sharp decline, and the market at this writing is in somewhat unsettled condition. Common Western Lead has been sold at from 3 70¢ down to 3.50¢. Between that range about 500 tons changed hands. Forced realization on speculative holdings is partly accountable for the decline, but there was some evidence of artificial pressure by a few local operators. At the close the market was about 3.45¢ bid, 3.55¢ asked.

Spelter.—The market has been unsettled and irregular, with comparatively little business in this quarter and no sign of livelier demand from dealers or consumers at the decline. Ordinary Western brands have been secured at 3.65¢ @ 3.70¢, and the latter is at present a common selling price. Special brands bring about the usual premium.

Antimony.—About the ordinary busines has been effected and prices remain practically unchanged. We quote at 9⅛¢ @ 9¼¢ for Hallett's, 10¢ @ 10⅛¢ for L. X., and 10⅛¢ @ 10¼¢ for Cookson's, in round lots.

Tin Plates.—A good business has been done in ordinary Cokes for prompt delivery. Somewhat livelier interest in future deliveries has also been manifested. Otherwise the market has shown little spirit, and prices remain without radical change. Spot quotations are as follows: Coke Tins—Penlan grade, IC, 14 x 20, $5 30; J. B. grade, do., $5.45 @ $5.50; Bessemer full weight, $5.40; light weights, $4.95 @ $5 for 100 lb, $4.85 @ $4.90 for 95 lb, $4.70 @ $4.75 for 90 lb. Siemens Steel scarce. Stamping Plates—Bessemer Steel, Coke finish, IC basis, $5.60; Siemens Steel, IC basis, $5.65; IX basis, $6.75 @ $7. Charcoals—Melyn grade, IC, $6.35 @ $6.37½; Crosses, $8; Allaway grade, IC, $5.60; Crosses, $6.75; Grange grade, IC. $5.75; Crosses, $6 85. Charcoal Ternes—Worcester, 14 x 20, scarce; do., 20 x 28, $11.35; M. F., 14 x 20, $7.50; do., 20 x 28, $15; Dean grade, 14 x 20, $5.30 @ $5.37½; do., 20 x 28, $10.50 @ $10.60; D. R. D. grade, 14 x 20, $5.15; do., 20 x 28, $10.10; Alyn, 14 x 20, $5.32½ @ $5.35; do., 20 x 28, $10.40; Wasters—S. T. P. grade, 14 x 20, $4.75; do., 20 x 28, $8.90; Abercarne grade, 14 x 20, $4.60; do., 20 x 28, $8.80.

Financial.

Nothing has occurred during the past week to produce any sensible improvement in the general business situation. The condition of things has changed little or not at all from that recorded in our last report. The Fabian policy of delay still prevails in the Senate, and although rumors of more decided action by the repeal majority in that body prevailed toward the close of last week, imparting a rather more hopeful tone to Wall street, no indication has yet appeared of any really effective means being adopted to that end. Meanwhile it is becoming plainer every day that until the present suspense is ended there can be no general and permanent revival of business.

Rumors of compromise by the Senatorial advocates of repeal are still persistently floated, and though probably without any basis, these rumors have a considerable effect in repressing confidence at home in the ultimate triumph of the repeal bill. They have, moreover, a disturbing effect on American credit in Europe. In view of the fact that the balance now outstanding of temporary loans made by foreign bankers during the late stringency, amounting, it is estimated, to over $20,000,000, will fall due at latest before the end of next month, it becomes a question of importance how this indebtedness is to be liquidated should the present unsatisfactory conditions be prolonged to that time. In addition to this contingency, European investors may be expected to retire much of their capital invested in this country, and to return their American securities in large amounts. These considerations do not offer a cheerful prospect for the monetary situation of the near future should the delay and uncertainty now existing be much further protracted.

The accumulation of money at this and other financial centers is, meanwhile, progressing rapidly, and this circumstance, in conjunction with an extensive retirement of Clearing House loan certificates, has caused considerable easiness in the money market. Last Saturday's weekly statement of the New York Associated Banks showed an increase in deposits of nearly $9,250,000 and in loans of $847,400. In cash the banks gained over $6,750,000 during the week, bringing the surplus in reserves up to over $28,500,000. The banks are, consequently, in a good position to extend ample accommodation to the commercial community, but they are not anxious to do much in this line while the outcome of silver legislation is still in the balance. A larger movement of currency to the South has been noted during the week, counterbalancing to some extent the movement of currency to New York.

The week has seen a further large contraction in the amount of outstanding Clearing House loan certificates. New York banks are retiring theirs at the rate of nearly $1,000,000 a day, and they are rapidly melting away. The amount of such certificates now outstanding here has shrunk to $13,210,000 from a maximum issue of $38,280,000; while Boston has reduced hers to $425,000 from a maximum issue of $11,045,000 a month ago.

Money on call continues in abundant supply, and offerings from banks and trust companies are large. Rates have been quoted as low as 1½ % and up to 3½ % since last Thursday. The last loans reported ruled at 2 % @ 2½ %, with renewals generally at 2½ % @ 3 %. Owing to the dullness in stocks comparatively little business is doing, however, in the loan market. Time money is inactive, rates being quoted at 4 % for 60 days and 5 % for four months on mixed collateral, with but little demand for this accommodation. Commercial paper is quiet, and purchases are mainly confined to interior banks. Choice indorsed receivables are quoted at 6½ % @ 7½ %, and other receivables and single names 7½ % @ 10 %. There is a good assortment of names in the market.

Foreign exchange up to the beginging of the current week showed a marked tendency to lower rates, with a good supply of commercial bills offering in consequence of increased exports of cotton. On Tuesday, however, the market for sterling stiffened, cotton bills having been absorbed and importers buying freely. Rates were consequently advanced; actual business being done at the close on the following basis: 60 days, 4 83 @ 4 83¼; demand, 4.85; cables 4.85¼ @ 4.85⅓; commercial, 4.81¾ @ 4.82. Domestic exchange on New York is quoted as follows: New Orleans, commercial 150 discount, bank par; Charleston, buying ⅛ @ 3/16 discount, selling par @ 1/16 discount; San Francisco, sight 20, telegraph 30 premium; Savannah, buying ¼ discount, selling ⅛ discount @ par; Chicago, par; St. Louis, 90 premium; Boston, 17¢ @ 12½¢ discount.

Operations on the Stock Exchange made an unusually small showing up to the beginning of this week. Interest in the international yacht race, and a legal holiday in Chicago on Monday, interfered with business on more than one day. The general tone of the market for securities has been unsettled and feverish. Although Wall street still takes a hopeful view of the outcome of the repeal struggle, the moral influence of continued delay has been marked in the transactions in stocks of late. The principal feature of Friday's speculation was an extraordinary advance of 10 points in Lackawannas, which also exerted a favorable influence on the other "coalers." Reading advanced on the payment of the October interest on some of its bonds, and an assurance that foreclosure would not be resorted to. Industrials were active and strong on Monday in a generally dull market, and material advances were made on small sales of several securities. Louisville, as an exception, fell 3 points on that day on selling of its stock by London, and the same stock experienced a further fall of 3 points on the following day. Trade in other railroad issues was feverish and irregular, owing to rumors of impending receiverships for certain roads. The following list shows the fluctuations

Hosted by Google

of some of the active stocks since October 5:

	Highest.	Lowest.	Closing, Oct. 11.
Am. Sugar Ref.....	92¼	89	91⅜
Atchison, T. & S. Fé....	20	18⅞	19⅛

Western Union.....	83	80¾	81⅛

Government bonds are strong, registered 4s having advanced ¼, and coupon 4s ½. A sale of $10,000 of the latter was noted on Tuesday at 111½ The closing quotations were:

	Bid.	Asked.
2s, 1891, registered.....	98	...
4s, registered.....	111	112
4s, coupon.....	111	112

Railway and miscellaneous bonds were fairly active and strong at the end of last week, but relapsed into inactivity during the early part of the present week.

Bar silver closed in London on Wednesday at 33¾ pence ℔ ounce, and in New York at 74¢ ℔ ounce. The Treasury Department on Tuesday purchased 115,000 ounces of silver at its counter offer of $0.7360 an ounce. The purchases thus far this month aggregate 495,000 ounces.

Exports of grain have fallen off during the week under review, but the outward movement of cotton has set in with some activity, and the total exports of merchandise show a satisfactory increase over those of the corresponding period of last year, while the imports are steadily decreasing.

British Iron and Metal Markets.

[*Special Cable Dispatch to The Iron Age.*]

LONDON, WEDNESDAY, October 11, 1893.

The Pig Tin market has been dull and prices have averaged lower. The only new feature was quiet buying of stock for shipment to America to remain in bond pending action upon the proposed repeal of the duty. The demand for this account was readily met by some prominent dealers, and that fact, in connection with absence of other speculative interest and slow demand from consumers, caused weakness. Sales have been made at as low as £78 for prompts. At the close the market was steadier, with Straits quoted at £78. 5/ for prompt delivery and £78. 15/ for three months' futures.

The Copper market has been very quiet and without new feature. Some operators are still working to depress prices, particularly a few identified with the American market, but sales are not pressed as vigorously at the present time as they were a short time ago. Home consumers are reported to be well supplied and the same is said of Continental consumers. There has been some improvement in the inquiry from India. At the close the market was quiet. Quotations were £41. 12/6 for Merchant Bars, prompt delivery, £42 for three months' futures and £46 for Best Selected English.

Aside from a few purchases of large lines of Oil sizes of Cokes there has been little movement in the Tin Plate market beyond very fair purchases of Charcoals for Canadian account in anticipation of closing of the season for shipping to that point. The Morlais and the Carmarthen works have been closed down owing to the depressed condition of the market. Exports last month were 25,000 tons, against 30,000 tons in September, 1892. The United States took 13,000 tons, against 22,000 tons last year. Stocks at Swansea are estimated at 239,000 boxes. Liverpool quotations are as follows:

IC Charcoal, Alloway grade.....12/9 @ 13/3
IC Bessemer Steel, Coke finish. ....11/6 @ 11/9
IC Siemens " " " .....11/9 @ 12/
IC Coke, B V. grade, 14 x 20.....11/6 @ 11/9
Charcoal Terne, Dean grade.....11,6 @ ..

Spelter is weaker with sales at as low as £16. 17/6 for ordinary Silesian and the demand slow.

Pig Lead has remained almost stationary at £9. 10/ for Soft Spanisb, with business moderate and the demand quiet.

There has been some improvement in the demand for Old Iron, but not enough to affect prices a great deal. Pig Iron, Manufactured Iron and Steel generally remain quiet. Exports of Pig Iron in September were 77,000 tons, against 80,000 tons during the corresponding month last year. Last dealings in warrants were at 42/3 @ 42/4 for Scotch. 34/9 @ 34/10½ for Cleveland, and 44/7½ for Hematite.

New York.

Office of *The Iron Age*, 96-102 Reade street, NEW YORK, October 11, 1893.

Pig Iron.—Buying continues on a moderate scale. Sellers, notably of Southern Iron, are inclined to some firmness. An offer to take 15,000 tons of warrant Iron, which was widely circulated in this market during the past ten days, did not lead to any business, because no seller could be found to meet the buyer's views. We quote Northern brands $14 @ $15 for No. 1: $13 @ $14.25 for No. 2; $12.25 @ $12.50 for Gray Forge, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11 75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft. Gray Forge is $11.25 @ $12.

Billets and Rods.—Some of the buyers of Steel Billets in this section have been tempted to purchase cash Steel by the low offers of Pittsburgh makers. What little export Wire trade is being done is based upon domestic Steel Billets. We quote nominally: Domestic Billets, $20.75 @ $23, and foreign Billets, $28 @ $28 50, tidewater; domestic Wire Rods, $29.25 @ $30, and foreign Rods, $39 50 @ $40.

Steel Rails.—The only order of consequence placed was a lot of 1500 tons for the Manhattan Elevated at private terms. A meeting of the Rail Manufacturers' Association is now in session in this city. It is believed possible that a lower range of prices may follow this conference. At this writing the meeting is still in session.

Track Material.—Small lots are selling at the following prices: Spikes, 1.80¢ @ 1.90¢; Fish Plates, 1.45¢ @ 1.60¢; Track Bolts, Square Nuts, 2.25¢ @ 2.40¢, and Hexagon Nuts, 2.40¢ @ 2.50¢, delivered. Concessions would be made for round lots.

Manufactured Iron and Steel.—Very little new business is coming up and 100-ton orders have become events. We quote nominally: Beams up to 15 inch, 1.75¢ @ 2¢; 20-inch, 2.10¢ @ 2.25¢, for round lots; Angles, 1.75¢ @ 1.90¢; Universal Mill Plates, 1.70¢ @ 1.90¢; Tees, 2¢ @ 2.15¢; Channels, 1.80¢ @ 2¢, on dock. Steel Plates are 1.65¢ @ 1.90¢ for Tank; 1.90¢ @ 2.10¢ for Shell; 2¢ @ 2.15¢ for Flange, and 2.50¢ @ 2.80¢ for Fire Box, on dock; Refined Bars are 1.55¢ @ 1.9¢, on dock, and Common, 1.45¢ @ 1.55¢; Soft Steel Bars are 1.50¢ @ 1.70¢; Scrap Axles are quotable at 1.75¢ @ 2.10¢, delivered; Steel Axles, 1.70¢ @ 2¢, and Links and Pins, 1.70¢ @ 1.80¢; Steel Hoops, 1.75¢ @ 1.90¢, delivered; Cotton Ties, 70¢ @ 72½¢ ℔ 45 ℔ bundle, at mill.

Old Material.—We quote: Old Iron Rails, $13 @ $14; Old Steel Rails, $8 @ $9, and Wrought Scrap $9 @ $11.

A very striking illustration of the curious manner in which reports concerning industrial establishments are developed is furnished by an item which appeared in a Philadelphia paper. A report from Chester announced that H. C. Frick of the Carnegie Steel Company had been in Chester, Pa., and had come to purchase the Wellman plant, at Thurlow, near Chester. The additional comment was made that the Carnegie interest was anxious to get a foothold near Philadelphia, where a good market for the product could be secured. We need hardly point out the fact that the Pittsburgh mills do not find it necessary to come nearer to Philadelphia than they are in their raids upon its markets. So far as the history of the item is concerned, we are informed that it grew out of a visit to S. T. Wellman from an old friend, John Fritz of Bethlehem. In some way the name of the latter was twisted into Frick, and on that slender basis the imagination of the local reporter built the superstructure of guessing to which we have referred.

The following dispatch from Altoona has been published in the daily newspapers: "The employees of the Portage Iron Company, at Duncansville, on the 8-inch and bar mill trains were notified a few weeks ago of a proposed reduction in their wages, ranging from 23 to 33 per cent. As those portions of the mills in this district have been paid the Pittsburgh rate of wages for more than 25 years, and the reduction there has been but 10 per cent., the men have quit work and demanded a continuance of the established basis." The facts are that there is no strike at the works of the Portage Iron Company, Limited. The men have been paid off and discharged and the finishing mills have been closed down, because the owners found it impossible to compete with mills in the district and pay the Western scale of wages.

The department of geology at Colorado College has been placed in charge of Joseph K. Surls.

HARDWARE.

Condition of Trade.

SINCE the opening of October there has been a perceptible increase in the volume of business, but orders for the most part are small and jobbers report those received by them as very carefully assorted, covering a considerable range of goods in small quantities. As customary at this season, seasonable goods constitute a considerable portion of the business, but they are not moving in the usual quantities. Skates are referred to as in especially good demand, owing to the fact that stocks in dealers' hands were pretty generally cleared out last winter. In Builders' Hardware the demand is only moderate and limited principally to goods required to finish buildings in course of construction. Very little building is in progress, a fact which also accounts for the limited demand for Nails. A good deal of complaint is made in regard to Mechanics' Tools, of which much less than the usual quantity are being sold. In manufacturers' supplies also the volume of business is comparatively small and houses dealing in these lines of goods complain much more than those who handle or manufacture articles which go directly to the trade. A fair business is reported by dealers in Tin Plate, most of whose orders are referred to as coming from retailers and in comparatively small parcels. There are few quotable changes in price, but the market has rather a weak tone, the tendency being toward lower values. Collections on the whole are fair, but some houses refer to them as being difficult and unsatisfactory.

Chicago.

(*By Telegraph.*)

Shelf Hardware jobbers were agreeably surprised the past week by a decided increase in their business. The character of the orders received, however, was about the same as previously, regular Hardware not constituting more than the recent proportion. The large numbers of very small orders sent in entailed an unusual amount of work. The packing force in several establishments was obliged to work for several nights in order to make prompt shipments, owing to the necessity of handling so many broken packages. It is an annoying feature of the present condition of the Hardware business. In ordinary time, with the demand running on full packages, there would have been no necessity whatever for night work in handling as large a volume of business as that of the past week. Quite a large number of Hardwaremen from the West have visited Chicago within the past few days in attendance at the fair. They report that business with them is not likely to be of a more than hand to mouth character this fall, because farmers are disposed to hold on to the bulk of their crops. The quantity so held is very large, but the means of providing better business is thus seen to be in hand whenever the farmers decide to sell. Heavy Hardware jobbers report a somewhat larger volume of business, but their trade is also running in the direction of very small orders requiring more than usual work to fill them. Collections are good; no complaint is heard on this score.

St. Louis.

(*By Telegraph.*)

The month is a third over and at this writing compares favorably with the corresponding period of last year. Retailers are sending in fair sized orders and show more disposition to buy freely than for some months past. Jobbers are not pressing sales, however, and continue to watch credits pretty closely. A good, cold snap would help things wonderfully, as the movement of cold weather goods has been exceedingly small. The shipments of cotton throughout the South have stimulated trade from that section, but it is still lighter than it should be at this season. Barb Wire and Wire Nails are inclined to weakness, particularly the latter.

Notes on Prices.

Wire Nails.—The Wire Nail market continues in substantially the same condition as at our last report, and $1.30 may be named as a general price for carload lots at mill. Some of the manufacturers have endeavored to obtain a slightly higher figure, but on especially large or attractive orders it is understood that this price has been shaded. The volume of business is moderate, and none of the mills are running to their full capacity. They are careful to avoid an accumulation of stock, and in some cases have not been able to ship goods as fast as required, their orders being for the most part for immediate shipment. The tone of the market is not at all strong.

Chicago, by Telegraph.—Wire Nail manufacturers report inquiries only moderate. Buyers who placed orders at very low prices some time since are complaining of trouble in getting delivery on such contracts and threats are made that the Nails will be bought elsewhere and the difference charged to the delinquent manufacturers unless they more speedily comply with their agreements. Prices on factory lots continue at $1.40 to $1.45, Chicago. Small lots are selling at $1.55 from stock.

Cut Nails.—Notwithstanding the fact that the demand is moderate, the market for Cut Nails seems this week to be in a slightly better condition than last week, and the quotation of $1 for carload lots at mill is quite generally adhered to, concessions being made in special cases. The market, however, is not strong, and it is not unlikely that a large order for a desirable assortment would secure relatively low figures. Small lots from store in New York are quoted at $1.25 to $1 30.

Chicago, by Telegraph.—Cut Steel Nails are in the same condition as previously reported. Orders are not large but are moderately numerous. Manufacturers are still quoting carload lots at $1.20 to $1.25, and jobbers quote $1.30 for small lots from stock.

Barb Wire.—The market for Barb Wire is not in a very satisfactory condition, and somewhat lower prices have been developed. The quotation of $2.25 to $2.30 for Four-Point Galvanized at mill fairly represents the market, but a concession on the lower of these figures is made by some leading manufacturers. Painted is held regularly at 40 cents less. The volume of business is moderate, but it is understood that a good many small orders have been secured. Lower prices for export are also quoted, the regular price now being $2.45, f.o.b. vessel New York, but it is understood that a somewhat lower figure is sometimes made.

Chicago, by Telegraph.—Manufacturers are doing a large business in Barb Wire. They have made decided inroads on the trade of jobbers, who report that for the past couple of weeks their business in this branch has been exceedingly light, while manufacturers talk much more cheerfully on the condition of the trade from their point of view. Carload lots of ordinary Galvanized Barb Wire are selling at $2.40, while Glidden is quoted at $2.50.

Hosted by Google

The jobbing price for small lots of ordinary Galvanized Barb Wire from stock is $2.55.

Lawn Mowers.—The volume of business during the last season is referred to by the manufacturers as having been exceptionally heavy, the fact being that the low prices which have ruled have induced a very large sale of the goods, the season on this line having practically closed so far as the manufacturers are concerned before the financial disturbance of the summer. The outlook for next year is regarded by the manufacturers as promising, provided general business conditions are reasonably favorable. An announcement in regard to the coming season is made by Dille & McGuire Mfg. Company, Richmond, Ind., for whom S. A. Haines, Indianapolis, Ind., is manager of sales department. Their catalogue, to which we have already referred, contains the following revised list of their Mowers, which is subject to a discount of 70 per cent.

Inch.	McGuire's Diamond. Style D.	Diamond High Grass. Style L.	Western. Style U.	Magic. Style W.	Crown. Style K.

Pony Lawn Mower, each.....$100

Oil and Gas Heaters.—The Oil and Gas Heaters put on the market by the Manhattan Brass Company, 44 Murray street, New York, and 506 Masonic Temple Building, Chicago, and illustrated in this issue, are sold at a discount of 25 per cent. from the following list:

Star Heaters.

	Each.
No. 40, Brass finish	$7.00
No. 40, Nickel "	7.75
No. 40, All Brass, including Cylinder	7.50
No. 44, Brass finish	8.00
No. 44, Nickel "	8.75
No. 44, All Brass, including Cylinder	8.50
No. 46, Brass finish	10.75
No. 46, Nickel "	12.00
No 46, All Brass, including Cylinder	11.25
No. 45, Brass finish	9 75
No. 45, Nickel "	10.75
No. 45, All Brass, including Cylinder	10.25

Hygienic Heaters.

	Each.
No. 48, Brass finish	11 00
No. 48, Nickel "	12.50
No. 49, Brass "	13 00
No. 49, Nickel "	14.50
No. 50, Brass "	14.50
No. 50, Nickel "	16.00
Gas Heater	5.00

Cordage.—Cordage at present is probably lower in price than for a long time. During the past few weeks, while there has been little quotable change, prices have been tending downward and are now slightly lower. Manila is maintained pretty firmly at 8 cents basis for large lots, f.o.b. factory or New York; but it is understood that in some special cases this quotation has been slightly shaded. Sisal and New Zealand are about ¼ cent lower than a few weeks ago. The volume of business is comparatively small and there is a good deal of competition among the manufacturers. The following are the present quotations for large lots, f.o.b. factory or New York, which are shaded in exceptional cases and are subject to a discount of 1½ per cent. for cash in ten days:

Manila, 7-16 in. diam. and larger	@ ℔ 8 ¢
" ⅜ in	@ ℔ 8½¢
" ¼ and 5-16 in	@ ℔ 9 ¢
" Tarred Rope	@ ℔ 7½¢
" Hay Rope, Medium	@ ℔ 8 ¢
Sisal, 7-16 in. and larger	@ ℔ 6¼¢
" ⅜ in	@ ℔ 6¾¢
" ¼ and 5-16 in	@ ℔ 7¼¢
" Hay Rope	@ ℔ 6¼¢
" Tarred Rope	@ ℔ 5¾¢
" Medium Lath Yarn	@ ℔ 6 ¢
New Zealand, 7-16 in. and larger	@ ℔ 6 ¢
" ⅜ in	@ ℔ 6¼¢
" ¼ and 5-16 in	@ ℔ 6¾¢
" Hay Rope	@ ℔ 6 ¢
" Tarred Rope	@ ℔ 5½¢

Stove Boards.—While as seasonable goods there has been a fair demand for Stove Boards, the volume of business is referred to as considerably less than usual. In the matter of prices there has been comparatively little irregularity, as the leading makers agree pretty well in quotations. There is, however, some difference in the prices quoted, and careful buyers usually find it worth their while to look into the market before placing orders.

Glass.—Manufacturers of Glass evidently consider that the condition of trade does not justify them in starting up their factories. This apparently has more to do with the lack of interest which they take in an adjustment of the wage scale than because an agreement could not be reached. If there was a prospect of making money if the manufacture of Glass was begun and continued the fires would be started even if last season's wages had to be paid. It is reported that the low prices at which Glass has been sold to the jobbers who are members of the National Window Glass Association has left no profits for the manufacturers, and that they now feel that it would have been better if jobbers had not been admitted as members. The situation is intensified by the announcement of a further reduction in the price of foreign Glass on the other side. Quotations on all kinds of Glass remain unchanged.

Hardware Boxes.

A. H GREEN, 22 Park place, New York, is in a position to supply from stock dovetailed white pine boxes, suitable for shelves in retail Hardware stores. This provides a receptacle for the contents of paper or pasteboard boxes, and uniformity is preserved. Enterprising merchants are more and more availing themselves of this method, and with the addition of two coats of shellac and one of hard oil finish a light and attractive appearance is obtained and a suitable background afforded on which to place numbers, samples, labels, &c. There are ten regular sizes, all 10½ inches long, varying in width from 3 to 18 inches and either 3½ or 7 inches high. Mr. Green also makes a Screw case of chestnut with knobs of like material, the whole front varnished. The case is 29½ inches high, 25½ inches wide and 8¼ inches from front to back, containing 80 boxes of five different sizes, each with a capacity of not less than one gross of Screws. Special sizes of boxes are made to order in lots of 50 and upward of each size.

National Retail Hardware Dealers' Association.

WE ARE IN RECEIPT from the secretary of the National Retail Hardware Dealers' Association of the following communication explaining the scope and objects of the organization and directing the attention of the trade to the work it is undertaking. We take pleasure in giving it place in our columns:

NATIONAL RETAIL HARDWARE DEALERS' ASSOCIATION,
OFFICE OF THE SECRETARY,
9 DOCK SQUARE,
BOSTON, MASS., October 4, 1893.

During the past few months, much has been written in the columns of your valuable paper in reference to the need of organization on the part of the Hardware trade. Many suggestions of practical value have been presented, and several local associations have been established, but in the opinion of the writer the most important step that has yet been taken, and one that will prove most beneficial to the trade in its entirety, manufacturers, jobbers and retailers included, and that will also in the end secure to the consumer a far better return for the money invested in purchasing than heretofore, is the action taken on September 20 at Chicago in the formation of the National Retail Hardware Dealers' Association.

So much has been written as to need of organization and the method by which it can best be accomplished, that I shall say but little on these questions, but shall endeavor to show in what manner the different departments of the business are to be benefited.

1. As to the manufacturer: It is my opinion that but few, if any, really desire to do a retail business, but they have been driven to it by the force of circumstances, and in many cases have been led to take the first step by the action of dealers, who, not having sufficient stock or samples of fine goods, or from a feeling of their inability from one or another cause to handle a job satisfactorily, have called in the services of some manufacturer. Such cases have very readily led the manufacturer to believe that he could well dispense with the services of the retailer. Other

Hosted by Google

manufacturers, learning of this action on the part of a competitor have felt that, as the saying is, they would "get left" if they did not do the same thing, have therefore been drawn into this competition, and the competition has been so sharp and the profits so much reduced that it seems to the writer they will hail with joy the formation of an association whose objects, if attained, will put an end to all such competition.

The same argument will apply as well in the case of the jobbers as the manufacturers, although they have not the same excuse for seeking this retail business, as it is doubtful f any jobber has ever been called upon by a retailer in the way above stated. Yet the result has been the same; competition has been sharp, profits reduced; and, as a certain prominent member of the jobbing trade remarked to the writer a short time since, "We should be glad to stop it if our competitors would also do it."

The consumer, as he often learns to his cost, can only get well served through the attention of some one who has not only learned how to sell goods, but how to apply them, and such knowledge can only be acquired after years of experience, and such service can only be secured through a representative retail house. The experience of many years has demonstrated that none other than the retail Hardware dealer can trim a building in a manner that will be at all satisfactory, and the customer who profits by this experience is rarely called upon to pay more than a fair interest on the investment.

Having thus, as it seems to me, demonstrated that it is for the interest of all classes to make this National Association a success, let us consider a little the methods to be pursued to accomplish this end.

In this connection, and to set at rest any doubts that may arise, I will state that it is not intended to be anything but national in its character.

Nothing approaching the nature of a trust or combination for advancing prices is intended.

The objects are simply to protect us in what we consider to be our rights—viz.: the handling of legitimate retail trade, without having to contend with both manufacturers and jobbers, and the consideration of any and all questions of importance, and last but not least, the establishment of a brotherly feeling throughout the trade of the entire country.

I would suggest, in furtherance of these objects, that every retail dealer who shall read this article would at once send to the writer a request for an application.

The membership fee has been fixed at $5, a sum so small that no one can but acknowledge that it will be more than repaid in the benefits derived.

I would also suggest the formation of local organizations as adjuncts of and in support of the National Association, and shall be pleased to correspond with dealers from any State in the Union, to receive any information or advice and to give such as may be required of me.

HIRAM G. JANVRIN, Secretary.

Arrangement of Stores.

SEATTLE HARDWARE COMPANY.

THE BUILDING occupied by the Seattle Hardware Company, Seattle, Wash., for their wholesale and retail business was built especially for the firm. The store, a ground plan of which is shown in Fig. 790, is 54 x 108 feet, in the Colman Building, corner of Front and Marion streets. Under the main store are two basements, each 27 x 108 feet. Across Post street in the rear is the warehouse, 108 x 117 feet in size, facing on West street; this is connected with the wholesale department by a bridge. The establishment is considered exceptionally complete; especially the retail department, to which the following illustrations and descriptions relate:

As shown in Fig. 790, two large show windows, each having a space of 20 x 6 feet, divided by a column, take up the front center of the store, with entrance doors on both sides. The windows are not incased at the back, but are divided from the store room by heavy curtains hung on silvered poles, 3 feet above the floor of the show windows. Back of these windows is a platform 2 feet wide for sampling Coal Hods, Water Coolers, &c. The arrangement of showcases, counters and shelving is shown in the ground plan, these being of polished ash, fitted up at a cost of $9000. Fig. 791 gives a view of the shelving on the right side of the store, showing the counters and showcases through the center and the offices in the rear. On entering the store, to the right is an upright wall case, a portion of which is seen in Fig. 791. The case is 9 feet high and 15 feet long, having five large plate-glass doors mounted on patent sheaves. The interior of the case is lined with red

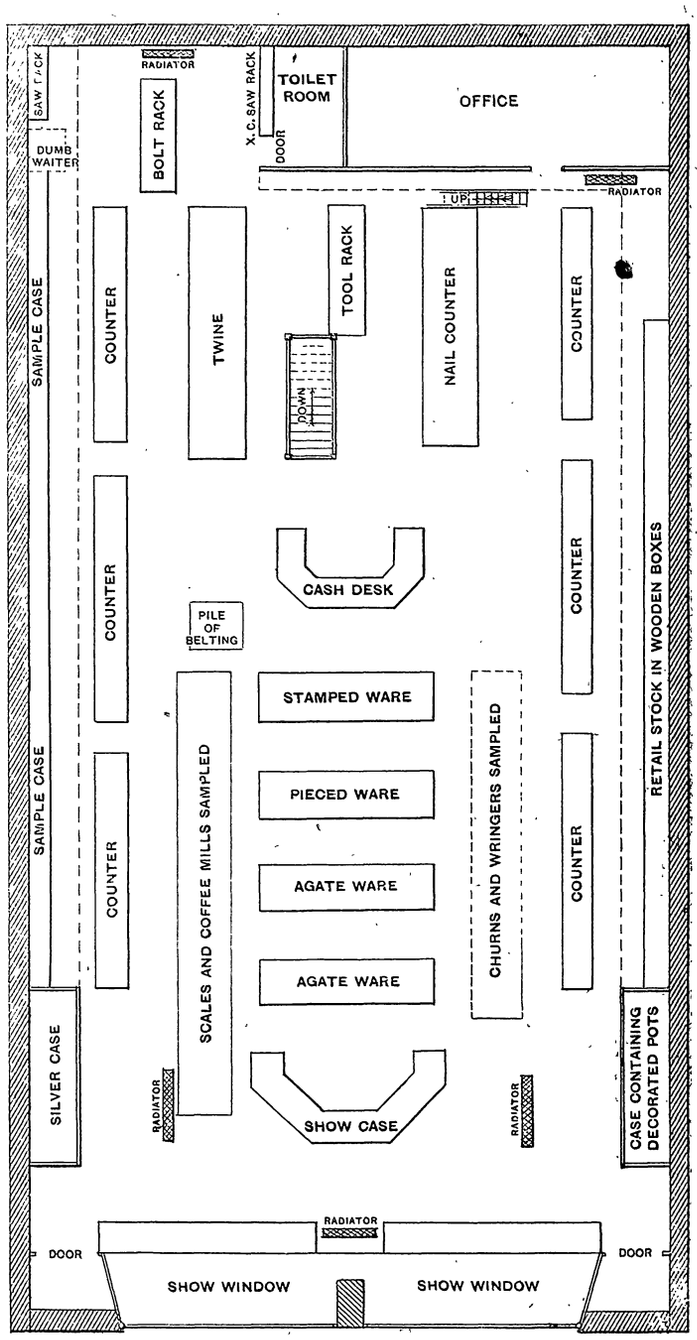

Fig. 790.—Plan of First Floor.

Hosted by Google

cloth, and contains a fine display of Manning, Bowman & Co.'s, decorated Tea and Coffee Pots. Following this case is the retail stock of shelf goods and tools of various kinds, kept in small boxes of the proper size, neatly covered with green paper and sampled; price cards being pasted on the side of each box.

Fig. 792 shows the arrangement and sampling of Shelf Hardware, and also the cupboards under the ledge. These cupboards are 3 feet deep by 2 feet 8 inches high, and extend to the rear of the store, containing long tools, such as Planes, Saws, &c. The dotted lines in Fig. 790 represent an elevated platform above the shelf boxes, which is also seen in Fig. 791. This platform is 4 feet wide, and extends along both walls, and the rear of the room. The shelving on the platform is 2 feet deep, extending to the ceiling, and is used for wholesale stock of light shelf goods. Tinware, Agate Ware, &c., are sampled on counters through the center of the room, making an attractive display. For all goods not contained in sampled boxes on the shelves, Root's Nos. 32 and 33 price cards are used, except the retail stock of Tinware and Agate Ware, this having the retail price marked on each article. The cash desk is located in the center of the store, back of these counters, Fig. 790, and is fitted up with Lampson's cash carrier system.

An ingenious arrangement is provided for hand saws in the original packages, as shown in Fig. 793. It will be seen that the shelving is cut out so that a firm grip may be had on the boxes in drawing them out. On entering the store to the left is a case like the one on the opposite side of the store, lined with red cloth, which is used for silverware, Fig. 794. Next to this is a long case with plate-glass lifting sash, the case being 9 feet high by 69 feet long. It has a green back ground, and contains all kinds of Hardware nicely sampled, for the use of the salesmen in the wholesale department. A section of this case, with samples, is shown in Fig. 795. Above these cases is the platform and shelving, as described above.

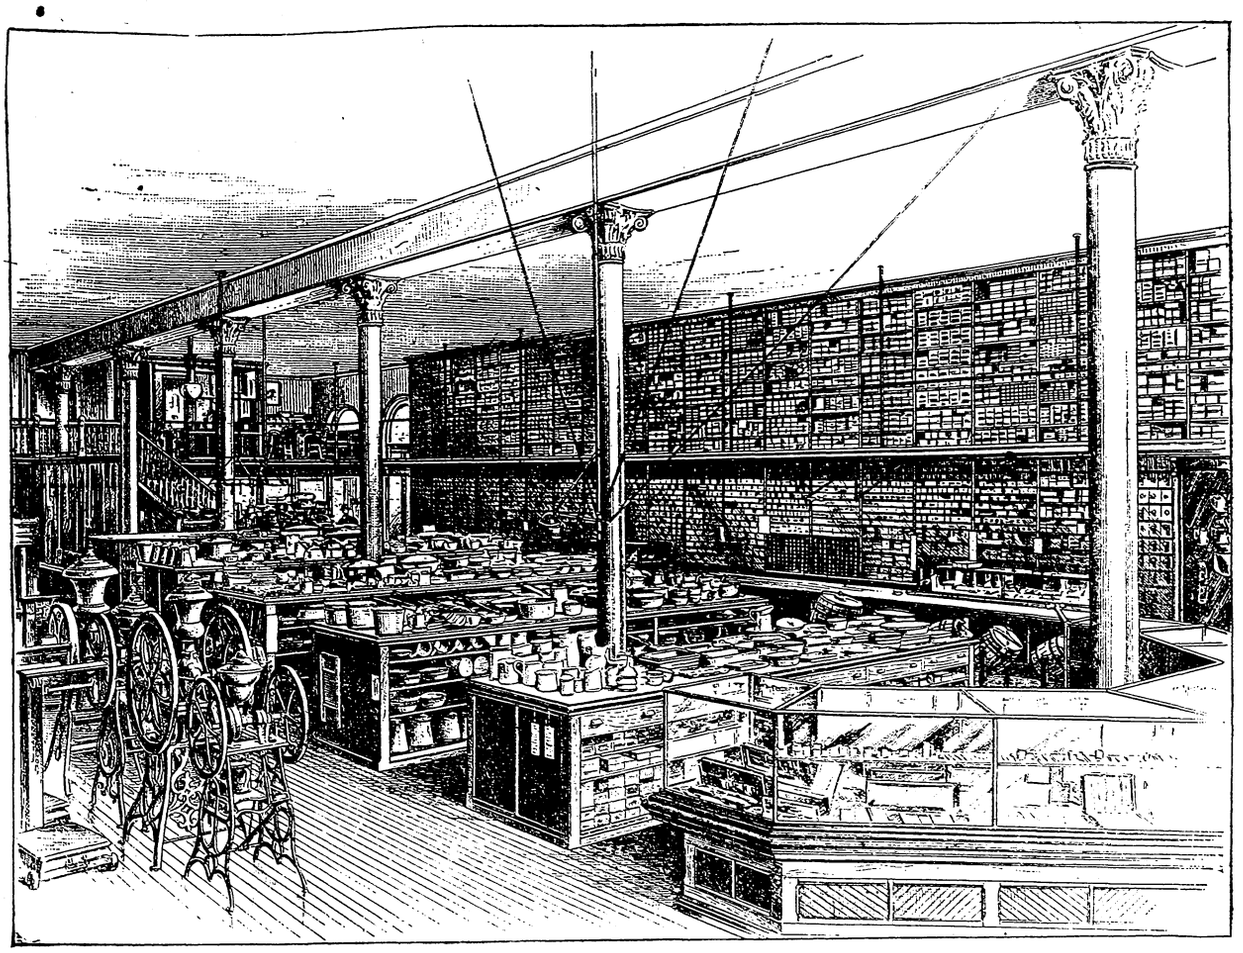

Fig. 791.—*General View of Salesroom.*

The Nail counter shown in Fig. 796, with Scales sampled above, contains an equal number of Nail bins on each side, the total number of which is 102. This being situated on the main floor makes it very convenient, besides giving ample room for a large retail stock of all kinds of Nails. The upper tier of bins project over the lower tier, thus allowing Nails to drop on the floor instead of into the lower bins.

Fig. 797 gives a view of upper and lower offices with stairway, the location of which is seen in Fig. 791. The platform upon which the upper offices rest is the same as mentioned before, except that it is 15 feet wide instead of 4 feet as the side platforms are. At the right hand of this platform, Fig. 791, is a room for the use of salesmen, for writing letters, &c. To the left of this room comes the treasurer's office; then the Cutlery room, this being 6 x 10 feet with shelving for Cutlery, Revolvers, &c. Next to this room is the office of the wholesale department, then the manager's office and purchasing department. The rooms below, on the main floor, are the general offices. Under the stairway to the upper offices are tiers of drawers to accommodate Horseshoe Nails, Bulk Tacks, Brads, &c. Since moving into their present quarters, the firm have added several lines of goods to their already large stock of Hardware, and are reaching out in every direction, increasing their jobbing trade, which now includes a large territory east of the Cascade Mountains, and an increasing trade in British Columbia, and as far north as Alaska, where a large trade is already established. The Seattle Hardware Company commenced business in 1885, the successors of Ballard & Sox, the Burwell Brothers entering the firm with Messrs. Ballard & Sox at that time. In the spring of 1890, shortly after the great fire, the members of the Black Hardware Company of Detroit, Mich., came into the firm, and its present officers are as follows: President, C. A. Black; vice-president and manager, A. S. Burwell; secretary, C. H. Black; treasurer, A. P. Burwell. The following are also stockholders in the firm: M. D. Ballard, F. D. Black, John L. Simpson and E. B. Burwell. The retail department is in charge of E. B. Bur-

Hosted by Google

well, and the wholesale department of John L. Simpson and C. H Black. The firm employ 30 men.

How to Treat Clerks.

FIRST ARTICLE.

By Fred Macey.

IT IS A NOTABLE FACT that almost every man who has made a marked success of his business has possessed and exercised the ability to gather and keep about him good assistants. To be able to do this is one of the richest faculties a business man can possess. A man's start and early growth in business depends entirely upon himself; but as business extends duties multiply, and he is forced sooner or later to divide his duties and intrust some of them to hired help. To know just the right kind of help to select, what duties to place upon it and how to treat it to secure his best services, is something that every business man must possess.

HUMAN NATURE.

A careful study of this subject forces upon one the fact that, while all men have their own peculiarities, which must always be taken into consideration with them as individuals, yet there is a certain likeness in human nature that makes it possible and necessary to take a certain position regarding the treatment of those in the employ of another; *e. g.*, it would not be practical for an employer to insist upon his bookkeeper using some set rule to calculate the correctness of an invoice—how he does it is a part of his education—but it is perfectly right for an employer to insist that it shall be calculated correctly. Neither would it be policy to set up certain rules as to how a salesman shall make a sale of goods, but it is entirely correct to require that if he sells he must do so at a certain price. How he does it is characteristic to himself and must be left very largely to him, but that it shall be done, and with certain results, is something that an employer has a perfect right to require.

HIS EMPLOYER'S INTEREST.

All men are engaged in business to make money, and the sooner an employer balances everything with this final end in view the better it will be for his best interests. Clerks should not be an exception to this rule, and no business man should keep in his employ any clerk that does not earn more than he receives, and it should be the aim of every clerk to serve the best interests of his employer, and the best service can only be given when a clerk works as if his employer's interests were his own. Few clerks work from this standpoint, but it is the only true one to work from. The rapid promotion of the clerk who is not afraid to work, who is constantly suggesting where small leaks may be stopped, expenses lessened, trade improved, business extended, is ample testimony to prove the truth of this rule—a clerk of this stamp is worth a dozen of those whose main aim seems to end in putting in so many hours for so many dollars.

PROMOTION.

While it is true that the value of a clerk to his employer lies mainly in himself, yet very often the employer himself is very largely to blame for the lack of results from his help. Instances come to mind of a young man who has left the service of one employer for that of a competitor. With one he could make but little progress, with the other his promotion has not only been rapid, but well founded. Why should this be so? The only answer that seems reasonable is, The one did not appreciate his ability and study to draw out his good qualities, whereas the other did.

INSIST UPON RESULTS.

Perhaps one of the most important points in dealing with a clerk is to have a definite understanding at the outset of just what is expected from him. Give him a definite field to work in and then insist upon results. Give him all the encouragement possible, but do not lose sight of results. They alone count in business. By giving him a definite field to work in the main cause for jealousies among clerks has been removed. Yet these outlines must be elastic enough to permit of suggestions that will be to the interest of the business. Throw the responsibility of a certain department upon a clerk. Hold him accountable for its success, and then, and not until then, can his ability be fully measured. No business man can hope to achieve success without some definite end in view. Neither can a clerk.

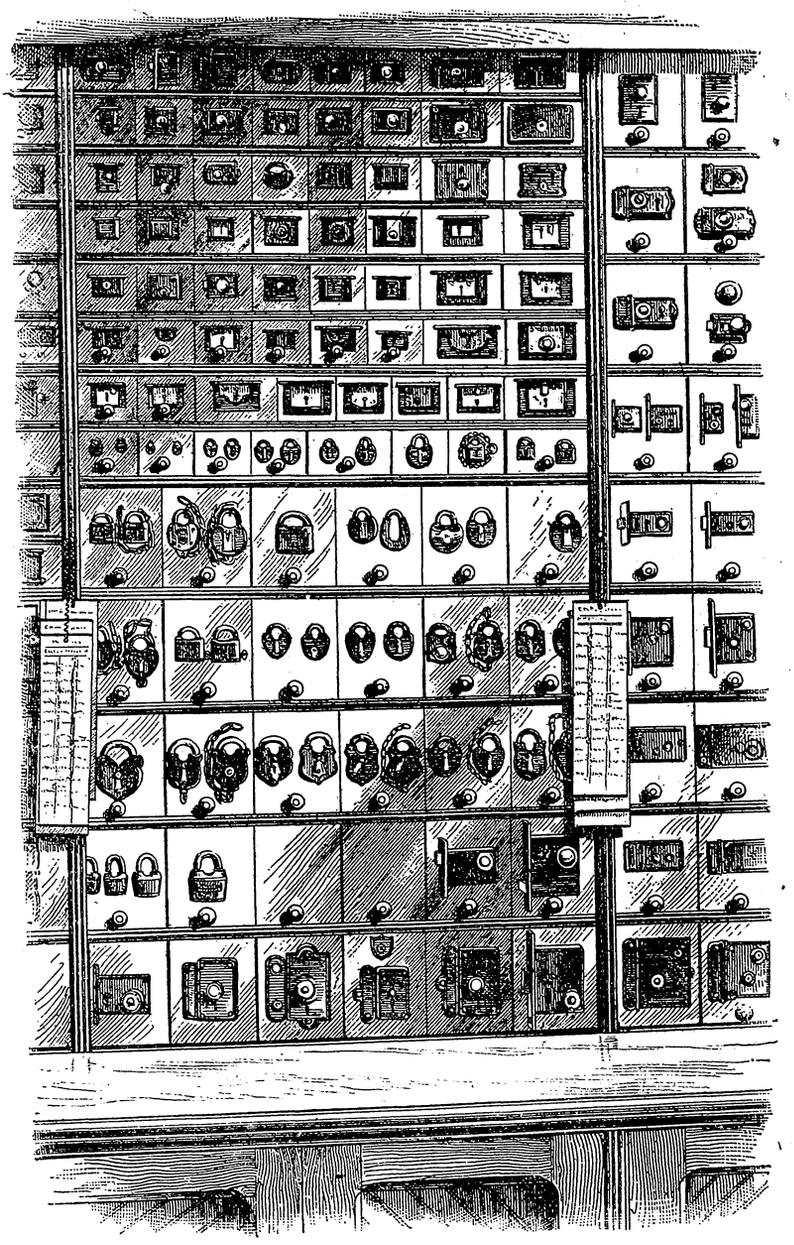

Fig. 792.—Arrangement and Sampling of Shelf Hardware.

BEING SOCIAL AND FAMILIAR.

A business man should command the respect of his employees. It is much pleasanter to receive a word of encouragement from an employer who is thoughtful in his suggestions, sincere in his actions, thorough in his work

Hosted by Google

and careful of his character, than from one who is not. A cold shoulder should be turned to all familiarities from clerks. They should cease at once. They never are productive of any good and certainly do harm. Do not confound being social and being familiar. It is an employer's duty to be social toward his employees, but familiar, never. An employer who is familiar with his clerks is generally not their best friend and seldom commands their respect.

MONTHLY WRITTEN REPORTS.

Clerks should feel that their efforts are appreciated, and it is an employer's duty to know what they are doing. Many a faithful clerk has been wronged by an employer not making it his business to know for himself, and know beyond a doubt, where to place the credit for a valuable suggestion. Many times a trusted clerk is less competent than some of his assistants. Many times he takes credit of merits that belong to another, and in return receives the advancement that rightly belongs to an assistant.

Compensation of employees is one of the vexed questions that a business man must contend with. While it is unquestionably an employer's right to say what he can and cannot afford to pay for a service rendered, yet it is his moral duty to allow himself to be influenced in these matters by a strict sense of justice, and justice only. Relationships, friendships, favoritism or sentiment should find no consideration whatever in these matters. When a young man feels that nothing stands between him and promotion except merit, he then has an incentive to push to the front, and it is an employer's duty to see that he has credit for what rightly belongs to him. Perhaps there is no more practical way to solve this question than to have each clerk make a monthly written report of what he has done. Knowing that a report of this kind must be presented to his employer, a clerk's pride and ambition will lead him to make a good record. He becomes careful, thoughtful, ever on the alert to make a suggestion that will help the business, ambitious to produce good results. There is an incentive in these reports to a clerk to do his best. And not only this, the employer also gets better work, gets a better idea of what is being done, and knows where to place the credit. An employer who will use these reports, verify them and adopt good suggestions from them, places himself both in a position to compensate his help justly, and to adopt improved methods for his business.

UNRELIABILITY OF HELP.

Honesty in a clerk is a quality that cannot be too fully appreciated, but the multitude of cash registers and similar devices in constant daily use testify to the unreliability of help. It is an employer's duty to insure

HONESTY

as far as possible, but just how to do it each employer must decide for himself.

Confidential clerks are an absolute necessity in every business, yet how difficult it is to find them—somebody who can be trusted, who is not afraid to work, who watches his employer's interests as if they were his, who has good habits, some one who can be relied upon at any time, who never says a thing is so unless it is so.

GOING TO A COMPETITOR.

The extent to which a business man takes a clerk into his confidence must be decided by himself. There is always the liability of a man's help becoming dissatisfied and going with a competitor. This cannot always be avoided, and it is poor policy to let him know more than is necessary to the proper discharge of his duties. Unnecessary knowledge can do a clerk no good and may do an employer great harm.

CONFIDENCE.

In selling goods, clerks should be furnished with a complete list of the prices at which they should be sold. These are the selling prices, and if any special occasion seems to warrant a special concession it should come from the management. What a dealer pays for an article should be kept a matter of confidence to himself and his buyers. This information in the hands of indiscreet clerks would do more harm than good.

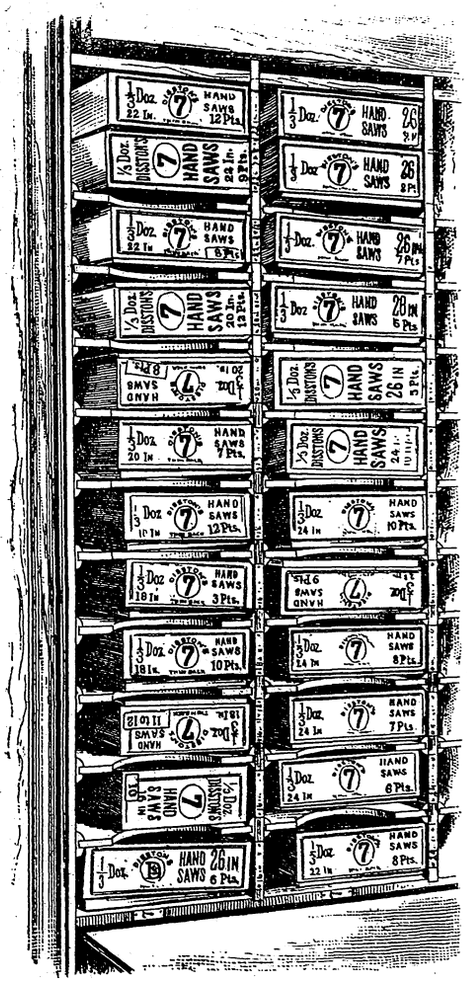

Fig. 793.—Shelving for Saws.

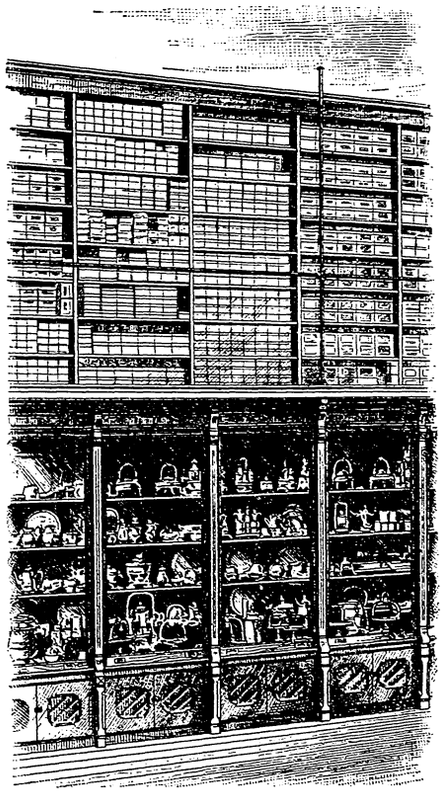

Fig. 794.—Silver-Ware Case.

Hosted by Google

LET THEM GO.

When an employer engages a clerk, he agrees to give in exchange for certain services a certain salary. If a clerk insists on his salary the employer has the same right to insist on his services. Punctuality in commencing work should be insisted upon. Many an order is lost for no other reason than tardiness in opening up. Better be half an hour too early than three minutes too late. Dissatisfied clerks will appear in every business. There is only one of two things to do. Satisfy them or let them go. It never pays a clerk to stay after he becomes dissatisfied—much less does it pay his employers.

MISTAKES.

Don't expect too much from clerks. Don't expect that they will not make mistakes. They certainly will, all men do. When they make a mistake, don't forget all their good qualities; these very often more than offset the other. An employer should never lose control of his temper. Good seldom comes of it—but harm, invariably. A business man cannot afford to give way to his passion. As soon as he does, he loses the mastery of the situation. An employer cannot afford to employ uncivil clerks; he should insist on neatness, pleasant address; should discourage profanity, lounging, use of tobacco, drinking, gambling, gossiping. The absence of these qualities, gives character to a house, draws a better class of trade than where they are permitted. A customer never objects to good character, but very often finds fault with the opposite.

PERSONAL INTEREST.

An employer should always manifest a personal interest in the private life of his help. It somehow seems to bind the interests of employer and employee more than anything else. An employer who can command both the love and the respect of his clerks can always get better service, more of it, and at less cost than one who fails in this respect.

Trade Items.

THE CHICAGO HARDWARE TRADE very generally observed Monday, the 9th inst., as a holiday, it having been designated "Chicago Day" by the World's Fair management. The Yale & Towne Mfg. Company closed their branch house in that city, and at the suggestion of President Henry R. Towne every employee was presented with a souvenir ticket of admission to the exposition.

GRISWOLD MFG. COMPANY, Erie, Pa., issue a circular under date September 25, in which they refer to a marked increase in their orders for the past three weeks, and suggest to their customers the desirability of early securing a supply of their goods, so that they may not

Hosted by Google

be taken short when the demand fully sets in. The company state that they are now prepared to fill all orders promptly, but it will not be possible to do this if orders are held back until the last moment. In addition to their regular line of Hollow Ware, American Dampers, &c., they call special attention to their line of Model or Toy Ware for holiday trade; also to their New American Waffle Iron with improved hinge and handle, Post Boxes, Cuspidors, Letter Presses, Tobacco Cutters with name plates, French Waffle Irons, &c.

CHAS. CROISSANT AND JOHN CROISSANT issue a card to the trade announcing that the business of Martin Croissant, Albany, N. Y., whose death has been noted in these columns, will be continued by them under the same name as heretofore.

LEGGETT & BRO., 301 Pearl street, New York, have recently secured a patent on the combination of prepared cork, brush and paper seal, used in connection with their new Glue brought out not long since. The cork is so prepared that it does not stick to the bottle, no matter how often removed and replaced, or how much the brush comes in contact with the neck of the bottle. The paper strap or seal is to keep the package intact until placed in the user's hands.

TAUNTON WIRE NAIL COMPANY, Taunton, Mass., are making special Box Nails, cut with a box or blunt point, so that if they strike a knot they will penetrate it, or else they will double up if the knot is too hard. The manufacturers remark that if a longer pointed Nail strikes a knot it will glance off one side and come out through the side of the box, which not only spoils that part of the box but necessitates taking the box to pieces in order to get that part out, or else throwing the box away altogether.

THE LENOX SHEAR COMPANY, Brookfield, Conn., are marketing a steel laid tempered straight Trimmer, both in full nickel and japanned handles, with jointed and unjointed blades. One of their brands is now made with a brass oval head screw and hexagon nut, with a washer under the head for a pivot on which the blade moves.

WILMOT & HOBBS MFG. COMPANY, 20 Murray street, New York, refer to the success so far achieved by their copperized steel anti-rust Oiler, recently put on the market, as evidenced by the quantities ordered. One of the principal objections to steel Oilers heretofore has been their liability to corrode. The company to prevent this are copper plating their Oilers both inside and outside. The outside is burnished to improve their appearance and render them more salable. The inside copper plating is to prevent rust and keep the oil from becoming gritty. The company refer to the fact that they are not in a combination on these goods and do not propose to be.

W. R. WALKLEY of the Peck, Stow & Wilcox Company has accepted an invitation to address the Hardware trade of Boston at a dinner to be given October 11.

THE HATCH CUTLERY COMPANY, South Milwaukee, Wis., and 97 Chambers street, New York, we are advised have been awarded first premium at the World's Columbian Exposition on all their goods, which include their patent bolt Shears and Scissors, Tinners' Snips, Automatic Knives, Razors, &c. The committee making the award refer to the exceptional merit of the Hatch patent Bolt and Washer, which is applied to the company's Shears, especially on account of its simplicity and practicability.

SHOENBERGER & Co., Juniata Iron & Steel Works, Pittsburgh, Pa., report that they are meeting with a good demand for their Extra Swaged, Roadster and Government Pattern Horse and Mule Shoes. We are advised that these Shoes are made from a special quality of soft homogeneous steel made by this firm, and that it is especially adapted for the manufacture of Horse and Mule Shoes, its present high quality being attained only after numerous and costly experiments had been made, with this object in view. New and improved machinery has also been recently introduced into their new factory, by which the capacity has been largely increased. The firm are sending out to the trade a catalogue descriptive of their different kinds of Horseshoes, giving full information in regard to their line.

Price-Lists, Circulars, &c.

C. SIDNEY SHEPARD & CO., 23 and 25 Randolph street, Chicago: Fall circular, under date of October 2. This is a 24-page catalogue of seasonable and other goods, comprising Common, Planished, Russia and Wood's Smooth Sheet Irons, Galvanized Iron, Soft Sheet Steel, Tin and Terne Plates, Metals, Wire, Rivets, Stove Bolts, Mica, Stove Boards, Fire Backs, Coal Hods, Coal and Fire Shovels, Stove Lifters, Pokers, Coal Tongs, Fry Pans and Skillets, Elbows, Oil Stoves, Roasting Pans, Dripping Pans, Tinners' Tools, &c. This firm have adopted the method of illustrating the different styles of Sheet Iron bundles in their circulars, as well as boxes of Tin and Terne Plates. It this way the appearance of the catalogue is relieved by the insertion of cuts in the usually monotonous array of tables of sizes and prices. With regard to Coal Hods the statement is made that all their Hods are now made with stamped bottoms.

MILLER WIRE SPRING COMPANY, Bridgeport, Conn.: Regular and special furniture Springs, pillow and bed Springs. The foregoing are tempered japanned Springs carried in stock; the same Springs will be made at short notice of coppered Spring wire. They also make to order special shapes, styles, sizes, &c, in either copered Spring or tempered japanned wire. The makers claim that as the result of their special method of tempering and japanning, all Springs run uniform in temper, size, shape, &c.

WILLIAM T. WOOD & Co., Arlington, Mass., Joseph A. Bogardus, 167 Chambers street, New York, agent: Ice Tools. Their fifty-ninth annual catalogue for 1893-94 illustrates Ice Elevators, Markers and Plows, Snow Ice Plane, Ice Chisels, Bars, Ice Adze, Ice Saws, Grapples, Forks, Sieve Shovels, Scoop Net, Ice Auger, Hoops, Tongs, Ice Axes, Scales, Hoisting Gins, &c.

THE DELAWARE HARD FIBER COMPANY, Wilmington, Del.: Hard Fiber Goods. It is stated that hard fiber is made from specially prepared vegetable fibers by subjecting them to the action of powerful chemicals and a vulcanizing process which, together with heavy rolling and pressing, completely changes the nature of the fibers, the product closely resembling horn, Goods, which are illustrated, made from hard fiber, include Rods, Washers, Disks, Fittings, Tubular Fuse Blocks, Insulating Flanges, Gear Wheels, Track Washers, Warehouse Cars, Boxes, Baskets, Oil Proof Gaskets, Carriage Axle Washers, &c.

FARWELL, OZMUN, KIRK & Co., St. Paul, Minn.: Catalogue of fall and winter goods. Illustrations are given of Axes, Handles, Wedges, Saw Sets, Cross Cut Saws, Wood Saws, Coffee Mills, Lanterns, Lamps and Lamp Stoves, Oil Cans, Hollow Ware, Meat Cutters, Stove Pipe, Elbows, Coal Hods Stove Boards, Shovels, Tongs, Chains, Registers, Scoops, Snow Shovels, Sleigh Bells, Sleds, Skates, silver plated Flat Ware, Table Cutlery, Carvers, Pocket Cutlery, &c.

JAMES A. TAYLOR & Co., Wilmington, Del.: Measuring Instruments of precision, also Adjustable Blade, Shell and Rose Chucking Reamers, Special Tools and Machinery. Illustrations are given of Measuring Machine, Calipering Machine, Correction Gauge Standards, Standard Reference Disks, Fixed Caliper Gauges, Adjustable Blade Reamers, Hardened Steel Mandrels, Adjustable Blade Shell Reamers, &c.

JOHN PRITZLAFF HARDWARE COMPANY, Milwaukee, Wis.: Price current of fall and winter goods. Among the goods to which attention is called in their 48-page illustrated catalogue are Axes, Saws, Meat Choppers, Snow Shovels, Stove Boards, Fire Backs, Oilcloth, Hay Knives, Corn Huskers, Lanterns, Oil Cans, Sleigh Bells, Lumbermen's Supplies, Saw Tools, Chains, Axe Handles, Loading Blocks, Wedges, Builders' Hardware, Cow Ties, Mauls, Skates, Cutlery, &c.

COATES CLIPPER MFG. COMPANY, Worcester, Mass.: Toilet Clippers. Advance sheets from their forthcoming complete catalogue, with artistic covers, are fastened together with colored cord. These few leaves represent their present series of Toilet Clippers, and are now issued that those in need of these goods may make selection.

THE NUBIAN IRON ENAMEL COMPANY of Cragin, Ill.: Circulars. One gives a partial list of jobbers handling Nubian in ½-pint Cans, also prints of cuts which the company furnish the trade for catalogue, circular or advertising purposes. Another is a testimonial from the World's Fair mechanical department stating that Nubian had been adopted for the boiler stacks after a thorough test.

It Is Reported—

That the Hardware firm of Lefavour & Lamson, Beverly, Mass., have dissolved. F. G. Lefavour will continue the business under his own name.

That the Hardware store of Graves & Tabor, East Aurora, N. Y., was entered by burglars a short time since and Cutlery and other goods stolen to the value of $200.

That Sterling & Leece have succeeded E. H. Sterling in the Hardware business at Bishop, Cal.

That F. Haffele & Co., Fonda, Iowa, Hardware and Stove merchants, have sold out to S. A. Stevens & Co.

That Richardson & Imhoff is the style of a Hardware firm recently starting in business at Van Wert, Iowa.

That Leroy Yates has succeeded M. P. Elwell in the Stove business at Portland, Maine.

Hosted by Google

Brad Brackett.

Brad Brackett kept a wholesale store
Under the Spring hoe-tel;
And though his ware was in demand
It was hard ware to sell.

His stock of staple goods was on
A scale you seldom find;
Including pokers, shovels, tongs,
Andirons of that kind.

Although a skillful financier,
He would not gouge in trade;
Nor chisel any one a bit,
If ne'er a cent he made.

A plane and quiet man, he ne'er
Was known to stirrup strife;
A firmer friend one never saw
En-gauge in business life.

Possessed of hinge-enuity,
That compasses one's ends,
He did his business on the square,
And had a host of friends.

'Twas not by any ax-ident
He rose above the rest;
The key to his success was that
He did his level best.

Nobody had a stronger faith
In printers' ink than Brad's;
He used to say he carved his way
To fortune with his adz.

He always paddled his own can-oe,
And, pulley as he might
Against the stream or with the stream,
Was sure to come out right.

Of being a strong partisan
He had the reputation;
But, rather than support bad men,
He'd bolt a nomination.

As a tack-tician he excelled—
In auger-nizing led—
Though screw-pulous, was sure to hit
The nail upon the head.

He deprecated rings and frauds,
And scorned a party tool;
In politics, religion, trade,
He observed the golden rule.

He was no misanthrope, but took
A file-anthro-pick view
Of life, with its vice-cissitudes,
As all of us should do.

A splendid "catch," he lived a bach,
Anvil-age belles were told,
They tried in vain his heart to gain
With beauty or with gold.

Though a teetotaler, he kept
The best of bars, 'tis true,
Where one could get his "nippers" and
All kinds of punches, too.

But fickle fortune chain-ged at last,
And caster threatening pall
O'er him, and with one fatal wrench
Deprived him of his awl.

His locks by sorrow's weight were turned
To silver, and were long;
He fell before the scythe of Time
To join Death's mighty throng.

—*Detroit Free Press.*

Paints and Colors.

It should be understood that the prices quoted in this column are strictly those current in the wholesale market, and that higher prices are paid for retail lots. The quality of goods frequently necessitates a considerable range of prices.

There is still an element of uncertainty in the position of dry White Lead that has more or less restraining influence upon operations of large dealers in the lines of goods into which that pigment enters as a prominent ingredient. The irregularity in Linseed Oil is less pronounced, and figures in smaller degree among the influences that gauge the operations of careful buyers. But more potent than either of these is the fact that buyers, large and small, continue to show decided partiality to pronounced conservative line of action. Grinders are taking bulk goods only as immediate wants dictate. Jobbers' purchases are gauged almost wholly by running count of stock. Retailers are quite as careful, and buyers of specialties manifest hardly the degree of interest that is shown at this season of the year.

White Lead.—The old list prices are kept in force by the National Lead Company and the sales agents identified with the combine state positively that no concessions are being made in this city or vicinity. From outside sources the information comes that the official quotations are shaded in other territory in order to meet the low quotations made by a few "outside" corroders. In this respect Dry White Lead figures most conspicuously, with carload lots reported sold at as low as 5½¢, net cash, or ¼¢ below the combine price for similar quantities, exclusive of regular discounts. In remote instances similar concessions, it is said, have been made on Lead in Oil. That jobbers are still selling on a very narrow margin over cost is the fact and the surface indications are that the market has more weak features than strong ones at the present time. The item of cost and peculiarities of the trade are, at all events, being carefully followed in all directions.

Red Lead.—Purchases of foreign brands have been on a smaller scale, and it is plain that large consumers are well satisfied with looking after stock that will be due shortly on recent contracts. Prices have not weakened perceptibly, but seem to be rather soft. In domestic brands there has been little movement, but, to all accounts, the business effected was at former prices.

Litharge.—Fairly good orders have been placed by glass and rubber manufacturers for low grade product used in the respective lines, but the higher grades used in the Paint trade have met with merely routine sale. Prices are still somewhat variable, but no weaker than they were ten days or a fortnight ago. The demand for French and German brands has moderated and is now of very ordinary character. As natural under such conditions it is easier to buy at prices that looked very cheap a short time ago. To that extent the market is easier. There has been no change in quotations for domestic stock and the demand for the same continues slow.

Zincs.—Deliveries of domestic Oxide in this vicinity have been hardly up to the full average for this season of the year, although on a somewhat larger scale. New business has been uneven and only fair in the aggregate amount. There is still some irregularity in prices on actual sale, but no change in quotations. Former list prices and terms are quoted for foreign brands, but the regular rates are being "cut" more or less in a quiet way, and cash buyers receive more than ordinary favors.

Colors, &c.—In the leading lines of Dry Colors there has been no decided change. The same may be said of Oil Colors. Specialties in the respective lines have fared somewhat better in point of sales, but in no other particular. The prompt payer or cash buyer, in fact, receives special favors. The volume of business is only fair for the season.

Oils and Turpentine.

The movements in prices have been on a narrow scale during the past week and transactions have continued on conservative lines of the most pronounced type. In the latter connection a few exceptions may be noted, but even there the difference from the general movement was in closing deals that have been under negotiation for some little time past, rather than in the nature of strictly new business. It is especially remarkable that fluctuations in prices have not only been few but slight, and it is impossible to point out where either buyer or seller has made more than shadowy gain.

Linseed Oil.—The margin between prices for Western and New York City brands is about the same as it was last week, and the general condition of the market is very similar as well. City brands are still quoted at 40¢, with usual allowance for packages. Western brands are about 2¢ less, without as liberal allowance, and the contest in the West that has a certain amount of influence here continues. It would seem proper to remark, however, that the Western conflict is mostly local and that Eastern buyers would have to take carloads of Oil to secure stock at the extremely low figures quoted there. Meanwhile, distribution at this point is hardly up to the early October average, and the demand is slow as well.

Cotton Seed Oils.—There have been acres of writing and a certain amount of calm consideration regarding the market for this line of Oils, but the finest theories advanced have failed to connect. The market thus remains in a state of irritating uncertainty and dependent largely upon export purchases that fail to materialize. Still, prices are fairly maintained at 34¢ @ 36¢ for prime crude, 39¢ @ 40¢ for prime Summer Yellow, and corresponding figures for other varieties.

Lard Oil.—There has been no further advance in prices, but the market is very firm, since the movement in cost of raw material has not favored venturing with sales on a lower basis. Hence prices for prime present make Oil stand at 75¢ ℔ gallon, while the low grades are relatively as high in the face of merely ordinary demand.

Fish Oils.—Upward of 800 barrels of crude Sperm Oil have been sold at 65¢ ℔ gallon, including about 300 barrels for export. This reduces the supply in first hands to about 8500 barrels. In crude Whale Oil there has been hardly anything doing, and the market is still enigmatical, but apparently steady. There have been a few sales of crude Menhaden Oil at the combine prices, and the market is unchanged. Bleached and pressed Oils move rather slowly, but chiefly at the prices that have ruled for some time past. Cod Oil is selling at former prices, but in a moderate way only.

Miscellaneous. — Cocoanut Oils are firmly held at the higher prices established last week, but the buying has been slow and the market is under speculative influence in some degree. Common Olive Oil in barrels is held firmly at full former prices for spot stock and lots in transit, say 58¢ @ 60¢ ℔ gallon; but the fact that forward shipments are offered at 55¢ @ 56¢ holds business in abeyance. Red Oils find merely routine sale at about former prices.

Spirits Turpentine.—In the face of quite large stocks here the average of prices has been somewhat higher, but the market shows weakness toward the close, with sellers at 28½¢ @ 28¾¢, ex-dock, according to style of package.

Oil and Gas Heaters.

The accompanying cuts represent three styles of a line of oil and gas heaters manufactured by the Manhattan Brass Company, 44 Murray street, New York, and 506 Masonic Temple Building, Chicago. Fig. 1 shows the No. 40 Star heater, which is made entirely of brass, with the exception of a Russia iron drum and aluminum top or cover. The base is nickel plated, of attractive design, with central draft burner and large wick. The wicking arrangement is simple, the wick being slipped over a cylinder, which expands at the top as the cylinder is turned down, and is thus held in place by teeth, without the aid of bands or tying. The wick is raised or lowered by turning the thumb screw either above or below the base. By turning the small projecting knob in the oil reservoir funnel, which is opposite the wick raiser, a register is opened, and into this funnel the oil is poured when filling. An indicator in the center of the funnel shows the amount of oil in the reservoir, whether full, half full or empty, enabling one to see at a glance when the reservoir needs replenishing with oil. The drum is held in position on the rim by a loose hinge and spring; in lighting the heater the spring is pulled back and the drum is tipped backward. The rim is perforated at the bottom, and the drum has perforations at the top as well as in the sides. When it is desired to heat anything at the top of the drum, or to have the heat ascend, the aluminum top is taken off, leaving a flat surface. The point is made that the movable top, being made of aluminum, will not discolor. The manufacturers claim that there is no disagreeable odor from these brass heaters, that 1 gallon of kerosene will heat a room 8 to 12 hours, and that the heaters may conveniently be carried from place to place. The heater is made with three other styles of bases besides the one shown, one of these bases being square. Bases are furnished in brass finish, nickel and all brass; also with brass drum. The Hygienic heater, shown in Fig. 2, besides embodying the advantages of the Star heater, has a water tank to moisten the atmosphere. The tank surrounds the burner and is designed to hold enough water to keep up evaporation until the oil tank needs replenishing. The deflector, which in Fig. 2 is being held in the hand, has perforations at the inner edge through which the vapor passes as it rises from the heated water. Thus rising close to the flame, the moisture is thrown out into the room. The No. 48 heater weighs 12 pounds, is 33 inches high and has a drum 9 inches in diameter. The drum and movable top of the gas heater in Fig. 4 are the same as used on the oil heaters. It is claimed that the gas burner is so constructed that the gas is superheated before being burned, in this way utilizing the gas to better advantage than in the ordinary burner.

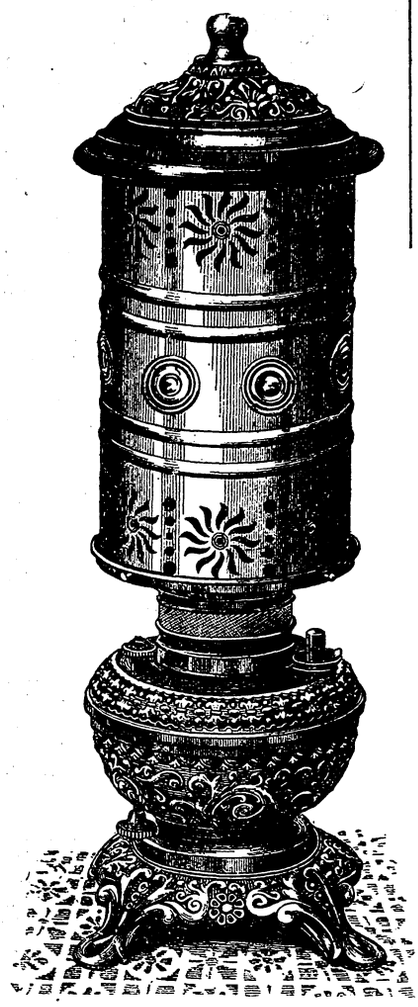

Fig. 1.—No. 40 Star Heater.

Fig. 2.—No. 48 Hygienic Heater.

Fig. 3.—Drum for Hygienic Heater.

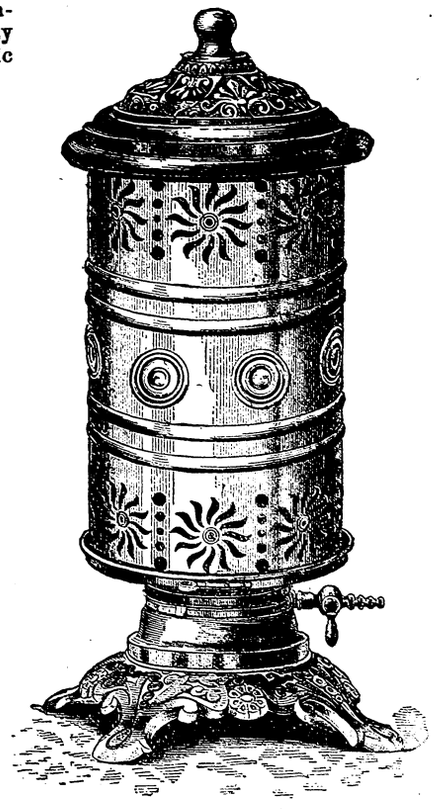

Fig. 4.—Gas Heater.

The following order, which betrays its German origin in every line and nearly every word, says a correspondent of (London) *Ironmongery*, is the most remarkable compound of mixed Ger-

man and English that ever came under my notice: "Mr. Glark blees sent me one of jur 7.9 jene revolvers und on box of cardridges as juick ju cann i will sent the mony on as sohn i resiev it tbe revolver und cardridges blees obleidg as juick ju cann send to" &c. The address on the envelope is a curiosity indeed. Substituting English letters for the German script where employed, it runs:

"Mr. Glark
for Street Exeter
Nearle obosite
Market Plaz
Tule Shopp."

Magnetic Curry Comb.

The Ives Mfg. Company, North Granville, N. Y., are introducing the magnetic curry comb illustrated herewith.

Magnetic Curry Comb.

The comb consists of a plate of magnetic metal, about $\frac{1}{16}$ inch thick, on the under side of which are cone shaped teeth, about $\frac{1}{4}$ inch long, cast on the plate. The comb is provided with a neat wooden handle, and the metal parts of the comb are nickel plated. The manufacturers claim that the comb is absolutely self-cleaning, no dirt or dust adhering to the comb; that it penetrates to the roots of the hair and brings the dirt to the surface; that in connection with a good brush a horse is well cleaned and will thrive on less feed; that it will not cut the hide or skin of an animal, and that should the comb come in contact with the mane or tail it will not pull or draw the hair.

The Cream City Flour Bin and Sifter.

Geuder & Paeschke Mfg. Company, Milwaukee, Wis., are offering a flour bin and sifter, as herewith shown. The

The Cream City Flour Bin and Sifter.

bins are made of tin on improved machinery especially built for their production, handsomely ornamented to make them attractive as well as useful, and each is packed in a separate package, strong enough, it is stated, to insure safe delivery at any distance from the factory. Notable among the features of the bin is a detachable shield, designed to protect the sifter from pressure by the weight of the flour, but to allow a sufficient quantity to pass through to insure quick and easy sifting, at the same time to obviate all grinding through of foreign substances. The bins are recommended by the makers as of more than ordinary merit, the sale of which will be found satisfactory and profitable.

Gersdorff's Improved Standard Funnel.

J. Hall Rohrman & Co., Philadelphia, Pa., are putting on the market Gersdorff's Standard funnel in an improved form. The improvement consists in the overflow ring, which is now spun on to the top of the funnel, instead of being soldered on, as in the old style. The funnel is made of three pieces of sheet copper or tin, seamed from the top to the center, and soldered from the center to the nozzle, with an overflow ring at the top. The nozzle is shaped triangularly, so that when in use the funnel rests firmly in the neck of a receptacle and makes three perfect vents for the escape of air during the process of filling. The funnel has a strainer so arranged as to be readily removed when required. The makers claim that they can now produce it at a price not exceeding that of an ordinary first-class funnel.

Self Cleaning Filter.

Henry S. Smith, Chadwick, Ill., is offering a self cleaning filter for cisterns, which obviates the use of charcoal and gravel. The filter consists of a rectangular tin box, within which is a cut off, and three wire screens one above the other, the top one coarse, the next one finer and the lower one finer still. At one side of the filter is a conductor pipe, open on the side next the filter, and so arranged that the water can be turned, by the use of the cut off, into the conductor, or caused to pass through the screens into a separate outlet to the cistern. The screens slope somewhat toward the conductor at the side of the filter, to allow the accumulated filth to wash off and be carried to the ground. The cap covering the filter and conductor can be slid up to allow the screens to be removed. On the top of the cap is a collar corresponding in size with the down spout to which the filter is to be connected.

The works of the Morewood Tin Plate Mfg. Company, at Elizabethport, N. J., have been closed down indefinitely, and the workmen discharged. The owners have not yet decided whether the cessation of work in this establishment will be permanent or not. Meanwhile the tin plate works of the Morewood firm at Gas City, Ind., are being actively operated. J. H. Rogers, the head of the Morewood interests, arrived from England last week, and remained in New York for a few days, when he left for Gas City.

Eight of the 12 great 13-inch naval guns destined for the armament of the "Indiana," "Oregon" and "Massachusetts" are completed and awaiting the tests at the Washington ordnance shops, and the remaining four will soon be delivered. These are the largest guns yet made for the navy. None of them have as yet been tested at the proving grounds, owing to delay in obtaining a trial carriage for such large pieces of ordnance; but the mount will be completed in a few weeks, when the guns will be discharged.

Current Hardware Prices.

OCTOBER 11, 1893.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

The character @ is used to indicate a range of price; thus discount 50&10@50&10&5 % signifies that the goods in question are sold at prices ranging from discount 50 and 10 % to discount 50 and 10 and 5 %.

THE IRON AGE

THURSDAY, OCTOBER 19, 1893.

The Heaviest Steel Casting for Marine Work.

We reproduce from a photograph a view of the steel strut for the screw shafts of the first of the new Inman "American liners," being built at the works of the Cramps, at Philadelphia. It is the largest and heaviest casting yet made by the Standard Steel Casting Company, at Thurlow, Pa., and also the largest single casting yet used for marine work in this country. Its weight is 67,135 pounds, over 30 tons. The growth of this industry in America has been very rapid and satisfactory, and it is somewhat strange that while there now exists no difficulty in producing

THE STEEL STRUT FOR THE SCREW SHAFTS OF THE NEW AMERICAN LINER.

the largest castings called for by any of the designers, it is still extremely difficult to successfully make the smaller ones, where by reason of coring and limited quantity of metal it is almost impossible to avoid the blow holes and spongy spots which render them so unreliable. This point must be overcome before the steel companies can hope to rival the productions of the iron foundries and tempt builders to further trials of steel for the small forms of castings where coring and thin parts exist.

A novelty in the way of a regulating device is the Mason vacuum valve, recently manufactured by the Mason Regulator Company of Boston, at the request of a large Canadian sugar refinery, which has now several in use. It is to the regulation of a vacuum what the reducing valve is to steam pressure, for by placing one of these valves in the exhaust pipe leading to the vacuum pump any desired amount of vacuum may be kept in the chamber by simply adjusting the valve. It is especially useful where different degrees of vacuum are desired in each one of a series of chambers, as in the triple effect process of sugar refining and other processes where a certain vacuum is desirable.

The Walrand and Legenisel Process.

R. M. Daelen, a prominent German engineer, reports in *Stahl und Eisen* concerning the Walrand and Legenisel process of manufacturing Bessemer steel castings. The process in question has attracted considerable attention on the Continent of Europe, and is the out growth of an effort to enable founders of moderate capacity to produce steel castings with a small Bessemer plant. The baby Bessemer has been somewhat discredited by the unsuccessful experiments made abroad and in this country. It appears, however, that more recent modifications have removed some of the troubles incident to the earlier trials. The main obstacle has been thus far the low temperature toward the close of the blow. The recent modification consists in introducing into the bath substances whose rapid combustion creates high temperature. For the acid Bessemer ferrosilicon is employed, and for the basic Bessemer ferrophosphorus is used; still, a pronounced success could not be obtained as long as the practice was to add the ferrosilicon or ferrophosphorus during the boiling period, because the combustion of the silicon or phosphorus is delayed through the presence of a large quantity of carbonic oxide and because considerable heat is carried off by the large volume of gas. Recognizing this, Walrand of Paris decided to make the addition after the carbon had been blown out and thus create a second blow. Mr. Daelen states that the success is complete. The addition of about 5 per cent. of fused ferrosilicon increases the temperature of the blow in a few minutes by 200° C., and makes it possible to carry on the elmination of what carbon there is still in the bath to a further point without introducing into the bath excessive quantities of oxygen. Therefore only a slight addition of ferromanganese is required for expelling the gases, which, besides, is facilitated by the high temperature. The process as invented by Walrand was developed in a practical way in the foundry of Legenisel Fils, at Paris, and a study of the operation led the Hagen Steel Works of Hagen, Westphalia, to put up two convertors having a capacity each of 1100 to 1500 pounds and producing per turn 4 to 5 tons of steel castings. Mr. Daelen states that with their experience in the manufacture of steel castings the Hagen works have succeeded in making with regularity hard and soft steel castings. Test pieces cut from the castings have shown a tensile strength of 59,700 to 71,100 pounds per square inch and an elongation of 25 and 22 per cent. respectively. Mr. Daelen claims that these Bessemer steel castings can be made much more cheaply than crucible steel castings, and that the baby Bessemer has certain advantages over the open hearth furnace in the manufacture of steel castings. The principal one is that the Bessemer converter may be started and stopped as readily as a cupola in a foundry, which cannot be done in the case of open hearth furnaces.

Massachusetts, according to the report of the State Highway Commissioners, loses $5,000,000 annually on account of bad roads.

Iron and Steel at the World's Columbian Exposition —VII.

BY E. C POTTER, CHICAGO.

The crowning glory of the iron and steel exhibits at the fair is that of the German firm of Fried. Krupp. This is as it should be, for while there may be corporations in the United States which consume more raw material and turn out a larger aggregate tonnage, yet for extent of plant, diversity of product, number of employees and excellence of material and workmanship the Krupp establishment easily leads the world. There probably never was a more extensive or costly display of iron and steel products assembled than is to be found in the Krupp pavilion. The word "iron" may as well be left out, for, with two or three exceptions, every article displayed is of steel, the exhibit thus becoming a valuable object lesson as to the completeness with which steel has displaced iron in the arts.

At the risk of repeating well-known data, I give a list of the component parts of these great works:

The main works at Essen comprise two Bessemer works with a total of 15 converters, four Siemens-Martin works, steel casting foundry, puddling works, welding shops, crucible steel foundry, iron foundry, projectile foundry, brass foundry, two annealing shops, hardening shop, crucible shop, cogging mill, rail mill, plate mill, mill for fish plates and spring steel, spring shop, hydraulic presses and armor plate mill, forge hammer shops, wheel forge, hearth forge, horseshoe forge, tire rolling mill, turning shop for sets of wheels on axles, boiler shop, shop for portable railway material, machine shop No. 1, file factory, repairing shops Nos. 1 to 4, railway repair shop; the ordnance department includes machine shops Nos. 2 to 5, gun shops Nos. 1 to 5, emery shop, boring shop, hoop shop, fuse shop, burnishing shop, gun reception department, gun carriage shed, gun carriage shops Nos. 1 and 2, limber shop, forge for gun shops, galvanizing and pressing shops, engravers' shop, nickel plating shop, laboratory work shop, tool store, projectile turnery, smith shop for shot turnery, lead melting shop, projectile reception department, gun store, packing shed, straw rope shop, proof butts, &c.; the testing department consists of test house and two chemical laboratories; the miscellaneous workshops include a carpenter shop, tinsmiths' shop, builders' joinery, furniture joiners' shop, cartwright's shop, painters' shop, saw mill, mortar shop, saddlers' shop, tailors' shop, steam producing plant, electric plant, gas works with four gasometers of 1,920,000 cubic feet total capacity, water works, fire brick and patent fuel works, brick kilns, coking plant, stone quarries, tile kiln, lithographic and photographic institute, including bookbinding, forwarding department, conveyance of goods, shops for telegraph and telephones, fire brigade and life saving appliances, supply stores, &c. In addition to the Essen works this great firm own and operate 547 iron ore mines in Germany, 13 of which are underground workings; three coal mines; steel works at Annen; four iron works, viz.: Johannes works, at Duisburg; Hermanns works, at Neuwied; Mülhofner works, at Engers, and the Sayner works, at which latter are also a foundry and engine works; sundry iron ore mines at Bilbao and the North of Spain; the shooting range at Meppen for artillery trials, with a maximum range of 15 miles; four seagoing steamers; sundry quarries, clay and sand pits; 3700 dwellings for workingmen; infirmary and two barrack hospitals; workmen's barracks and dining rooms.

In the year 1890-91 the Essen works consumed 722,885 tons of coal and coke, the outlying works and steamers consuming in the same time 530,276 tons, making the total consumption for that year 1,253,161 tons, or about 4200 tons per working day. There are smelted daily about 1800 tons of the firm's iron ore. The consumption of water in that year was 9,230,000 c. m., or the same number of tons. This is distributed through the works and buildings through pipes and conduits aggregating 113 miles in length. The consumption of gas was 424,000,000 cubic feet, distributed through 144 miles of pipes. The electric light plant includes 50 miles of cable, 573 arc lamps and 1804 incandescent lamps. There are 30 miles of standard gauge and 21 miles of narrow gauge railway in the works, with 33 locomotives and 1217 cars. The telegraph and telephone system comprises 20 telegraph stations, with 35 instruments and 50 miles of wire; 200 telephone stations, with 202 instruments and 172 miles of connections. There are also 70 additional fire alarm stations. The supply stores comprise every variety of domestic supplies. The general census of 1892 shows total number of employees to be 25,301, of which 16,956 are employed at Essen and 8345 at the iron works and mines. The members of families aggregate 60,290, making a grand total of 85,591 souls not only dependent upon but actually cared for by this colossal establishment. Of these there are 16,588 school children. To the foregoing should also be added the works of Madgeburg Buckau, purchased during the past summer, but of which there are no data at hand.

It is, therefore, with a keen appreciation of the gigantic size and importance of this establishment that we enter their very extensive exhibit, housed in the striking pavilion on the lake shore south of the peristyle. The center of interest for the general public is, of course, the huge 125-ton gun. The history of this gun, its construction, its transportation from Essen to the fair, has been so often and so fully told one need only mention it in passing. A gun that is of more interest because of its tremendous power in proportion to its size is the 9.45-inch gun. Its great range is thus graphically illustrated: If this gun were mounted at Pre St. Didier, Switzerland, at an angle of elevation of 44° it could throw a projectile weighing 475 pounds over Mont Blanc, clearing the summit by 9000 feet and landing the shot in the neighborhood of Chamounix, 12½ miles distant. At a distance of 2187 yards this terrible engine of war can penetrate a wrought iron plate of a thickness of 23 inches. In addition to these two guns the firm also exhibit a 12-inch 61-ton gun for ships of war, an 11-inch 42-ton coast gun, an 8-inch 14-ton naval gun, a 6-inch quick firing naval gun, a 4.72-inch quick firing naval gun, a 3 43-inch quick firing naval gun, a 3-inch quick firing army gun, a 4-inch siege gun, a 9 45-inch siege mortar, a 3-inch portable mortar, a 3-inch field gun, a 2.4 inch boat gun, a 3-inch mountain gun and a 1 46-inch bush gun. Nearly all of these have their mountings complete, and all sizes and kinds of projectiles are shown. There is also a most complete and comprehensive display of armor plate of various thicknesses, in most of which the effects of shot are shown.

But the steel manufacturer turns with more interest to those articles devoted to the peaceful pursuits and in which the firm of Krupp are no less famous. There are few railroads in America that are not familiar with Krupp tires. These are here shown in great profusion together with cast steel wheel centers, some of which have been subjected to remarkable distortion. The steel forgings include a crank shaft for an Atlantic express steamer, with thrust bearing, cranks, &c., complete, of a total length of 90 feet and weighing 103 tons. The four bladed screw attached to it is of cast steel and weighs 26 tons. A shaft of 12 inches in diameter and 82 feet long was forged by hydraulic press from a block of crucible steel 9 feet long and 4 feet in diameter, and subsequently bored out through its entire length to a diameter of 4.32 inches. A pinion for an armor plate mill of forged steel 3.6 feet width of face, 5.24 feet pitch diameter, with helical teeth milled out of the solid. There are also numerous examples of locomotive forged crank shafts, crank pins, piston rods, pump rods, &c. Among the cast steel articles the most noticeable are a ram stem and a stern post and rudder frame for a ship of war. The stem was molded in three parts, the heaviest weighing 15 tons, the total being 23 tons. The stern post and rudder frame were each molded in one piece, the former weighing 12.6 tons, the latter 11 tons. A bed plate for a cruiser engine, weighing 6 tons. An American consolidated locomotive frame cast in one piece, weighing 1.47 tons.

But the one piece in the whole exhibit which would impress a metallurgical engineer as being the most remarkable and as displaying the highest skill and workmanship is a train of gears for Krupp's own armor plate mill. This consists of two gears, one of 4.14 feet diameter, the other of 13.75 feet diameter, both of 3.28 feet face. Both are cast of crucible steel, the smaller one weighing 5 tons, the larger 20 tons. The smaller has 20 helical teeth, the larger 71 helical teeth of 7.12 inch pitch. The difficult nature of the castings, the material from which they are poured, the accuracy of the work and the smoothness of the finish are such as to excite the highest admiration.

The rolled steel articles include, in addition to the armor plate, a plate for a hydraulic bending press 11.15 feet long, 10 feet wide and 3.28 inches thick, weighing 73 81 tons; a boiler plate of Siemens-Martin steel, 65.5 feet long, 10.82 feet wide and 1.26 inch thick, weighing 16 tons; a boiler head 12.79 feet diameter and 1.5 inches thick, weighing 3.38 tons. These two last show the enormous capacity of Krupp's plate mill. Articles of pressed steel are in great number and variety. They include railway bogie trucks, locomotive domes, gun carriage walls, parts of limbers, ammunition wagons, &c., projectile shells, cream separators, balls for ball bearings and a very large number of die forged articles

Among the miscellaneous articles shown not the least interesting is a pair of hoisting shears capable of lifting 83 tons, specially designed for handling gun barrels and used for placing in position the guns in this pavilion. There are also shown special designs of small hand and power rolling mills for rolling and polishing precious metals, tinsel, &c., and for use in mints.

The pavilion itself is handsomely

Hosted by Google

decorated with views and maps of the firm's works and properties. An interesting feature is the model of the very modest ancestral home of the Krupp family, the original of which is still preserved in the midst of the great works which in the course of years have grown up around it. There is also a model of the monument, one-twentieth of the actual size, erected by voluntary contributions of the employees to the memory of the late Alfred Krupp.

One can devote hours of examination and study to this most elaborate and comprehensive exhibit, which, together with the superb display of the Gebrueder Stumm in the Mining Building easily wins for the German Empire the first place in the iron and steel industries at the World's Columbian Exposition.

English exchanges record the disappearance of an interesting and famous old landmark in the demolition of the Fazeley street rolling mills of Clifford & Co. of Birmingham. The old building was erected in 1737, and was a few years later acquired by a couple of Birmingham metal rollers, who are said to have been the first in the trade to employ steam for driving power. There is still upon the premises of Clifford's mill an old engine, known as "Old Bess," with wooden beam, dating back to 1802, and the beam is apparently as perfect now as when erected.

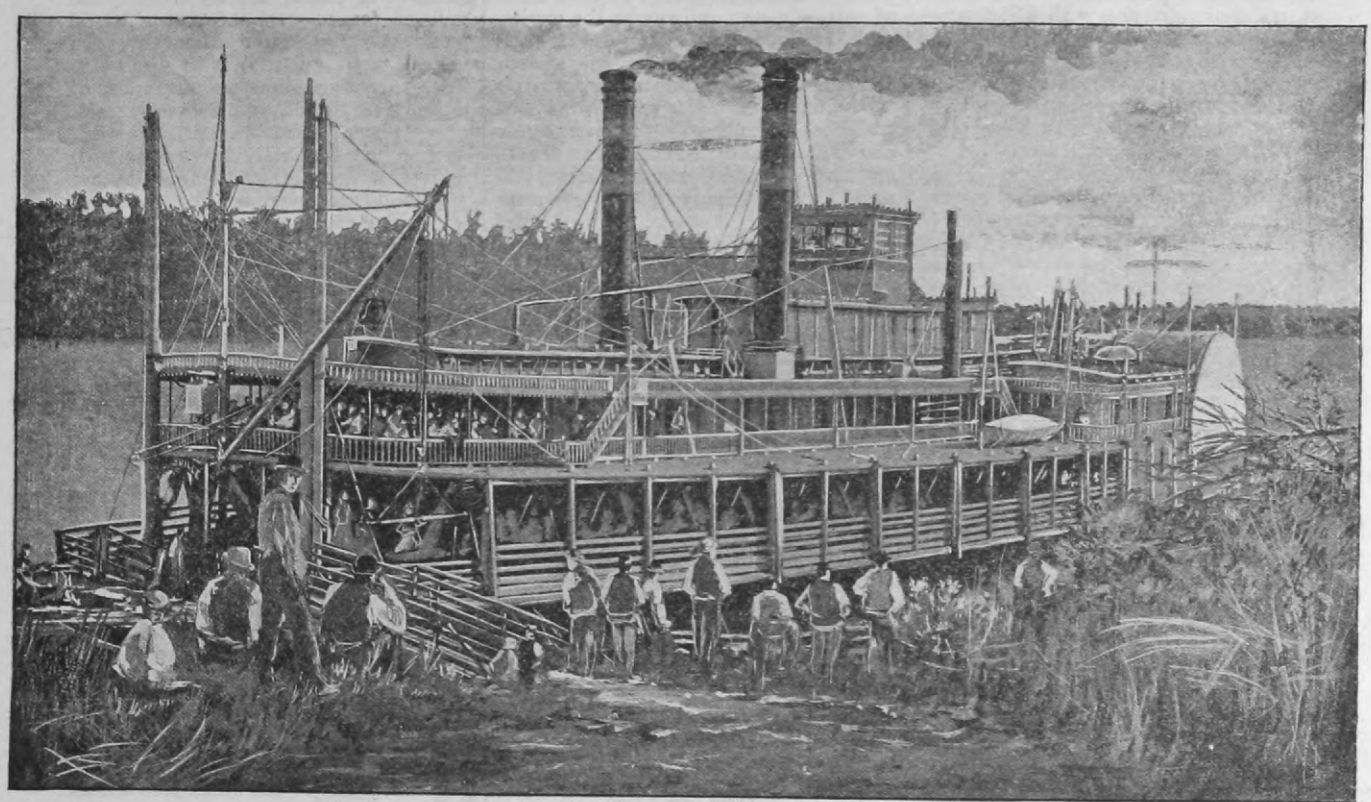
New South Wales, Australia, is likely to have an iron and steel works. The announcement is made that important concessions and mineral rights have been acquired for the purpose, and a company is being formed to carry out the scheme. The Government of the colony have offered a premium for successful works of this description, and the new enterprise will start under fair auspices on property at Wallerawang, where coal, iron ore and limestone are said to be found in abundance.

The Construction of Steamboats Navigating the Western Waters of the United States —I.*

BY JOHN M. SWEENEY, WHEELING, W. VA.

It is perhaps unfortunate that it cannot be definitely settled when was the date of the first attempt of navigation of boats propelled by steam.

In a work, published some 40 years since in Spain, of original papers relating to the voyage of Columbus, preserved in the royal archives at Samancas, and those of the Secretary of War of Spain, in 1543, it is stated that Belasco de Garay, a sea captain, exhibited to Charles V, in the year 1543, an engine by which the largest vessels could be propelled even in a calm sea without oars or sails. The emperor decided that an experiment should be made, which was successfully attempted June 17, 1543, in the harbor of Barcelona. The experiment was on a ship of 209 tons called the "Trinity." Garay never publicly exposed the construction of his engine, but it was observed at the time of the experiment that it consisted of a large caldron of boiling water and a movable wheel attached to each side of the ship.



From this statement it would appear that De Garay not only originated the steam engine, but made at the same time its application in one of its most practical and beneficial forms, and at a single effort accomplished that which took the light and talent of several generations to invent and bring to practical shape.

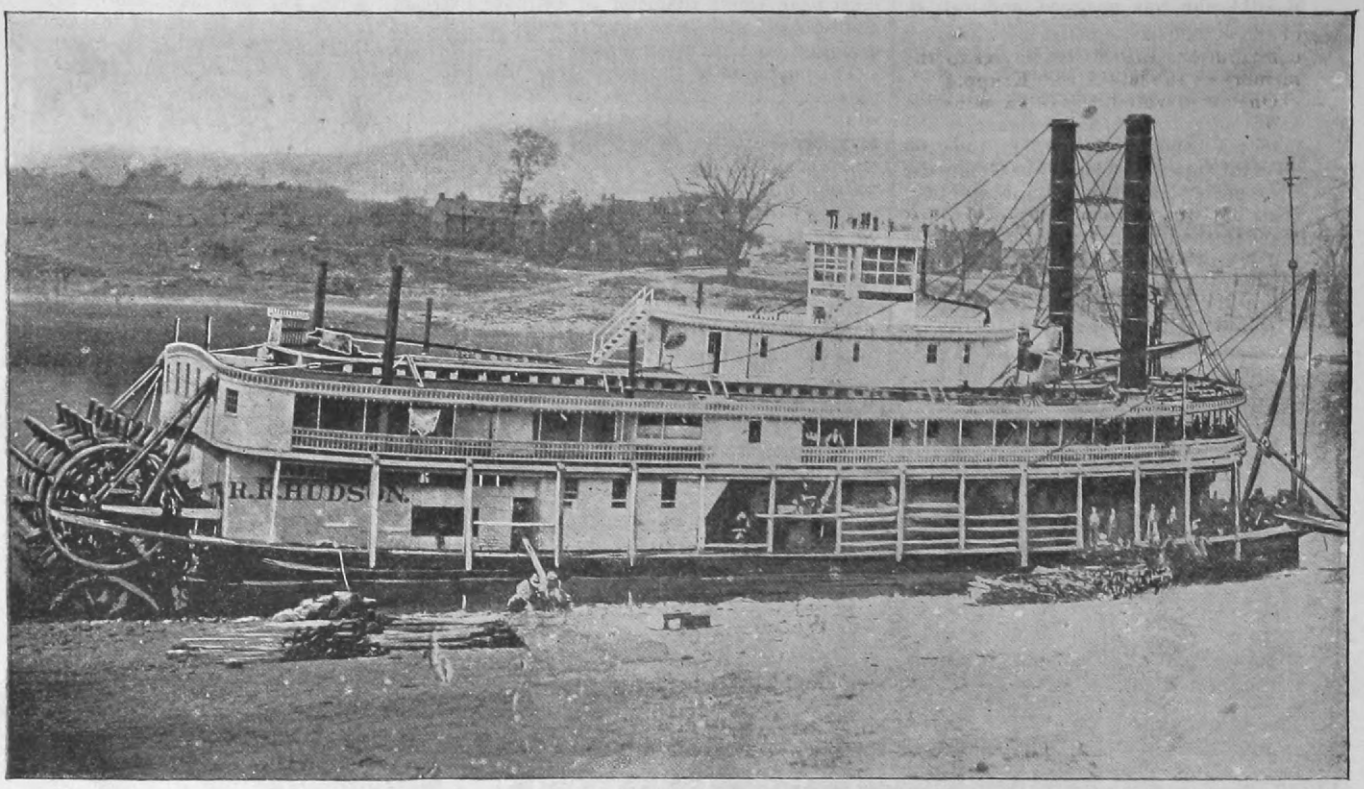
This statement, although based on the archives of Spain and those of the Secretary of War of that kingdom, are by some discredited, as the date is 54 years before the birth of the Marquis of Worcester, who is given by history the credit of being the inventor of the steam engine. It might be said in rebuttal that the incident just quoted of "De Garay's" experiment possibly came in some way to the Marquis's notice, and that he proceeded, after the manner of all inventors, to improve upon it. There is also a fact in history as to an early steamboat that might justify the belief that both Fitch and Fulton were not entirely original in their idea of a boat propelled by machinery moved by steam, presuming even that De Garay's exhibition in 1543 had not accidentally come to their knowledge.

A treatise was printed in London in 1737 describing a machine invented by Jonathan Hulls for carrying vessels against wind and tide, for which George II granted a patent for 14 years. A drawing is attached to the treatise showing a boat with a chimney smoking and a pair of wheels rigged over each side of the stern. From the stern of the boat a tow line passes to the foremast of a two decker, which the boat thus tows. This is evidently the first idea of a steam towboat. As this was a published treatise and there was a patent on record, public information of a steamboat must have circulated before the experiments of Fitch and Fulton, or Stevens or Livingston; and while similarity of ideas in inventions is not infrequent, absolute originality is difficult to establish.

It would seem from the following extract from a diary kept by James Kenny, a Quaker trader at Fort Pitt, in 1761, that the Western waters of the United States had originated some of the first germs of the ideas of steamboat propulsion. The extract is:

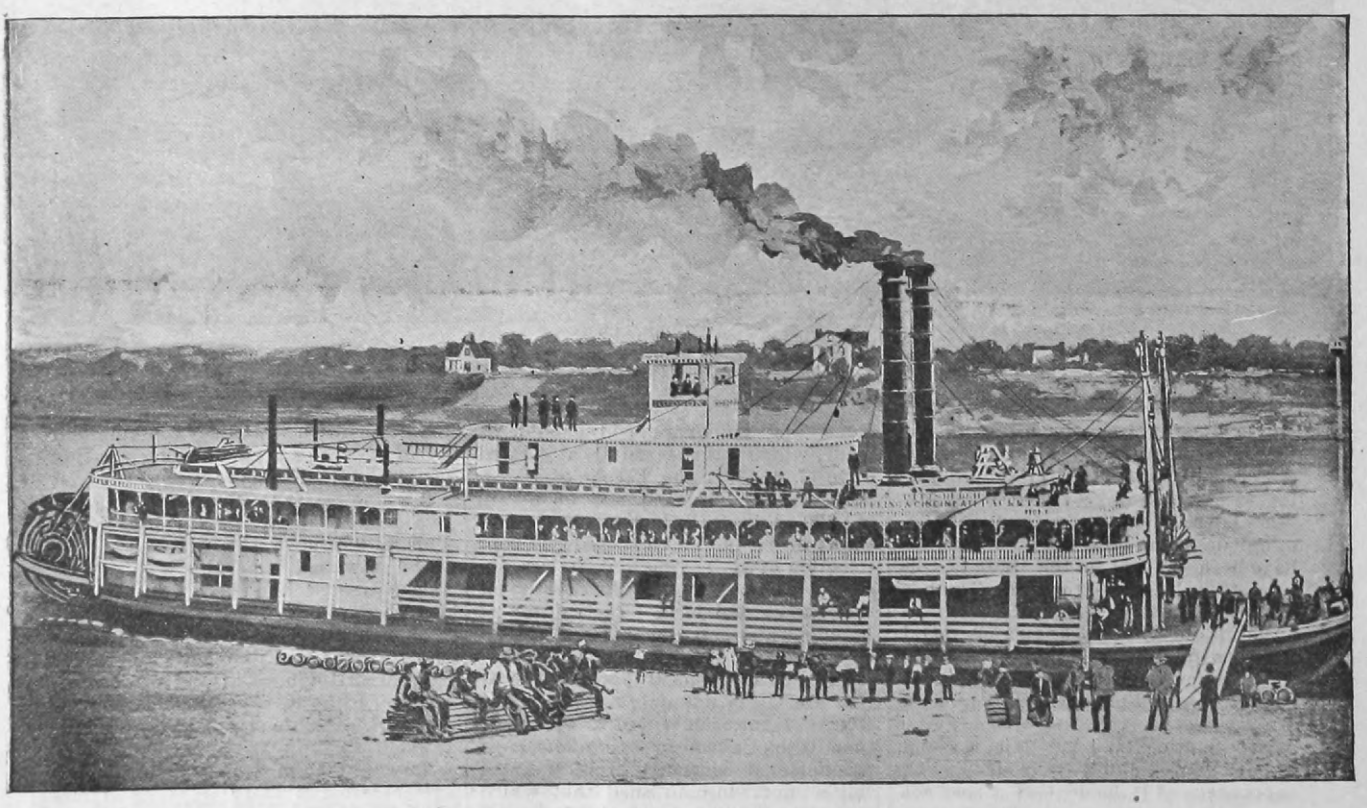
"1761, 4th mo., 4th: A young man called Wm. Ramsey has made two little boats, being square at the sterns and joined together at the sterns by a swivel, make the two in form of one boat, but

S.S. FLEETWOOD.



* From a paper read at the World's Engineering Congress before the Division of Marine and Naval Engineering and Naval Architecture.

Hosted by Google



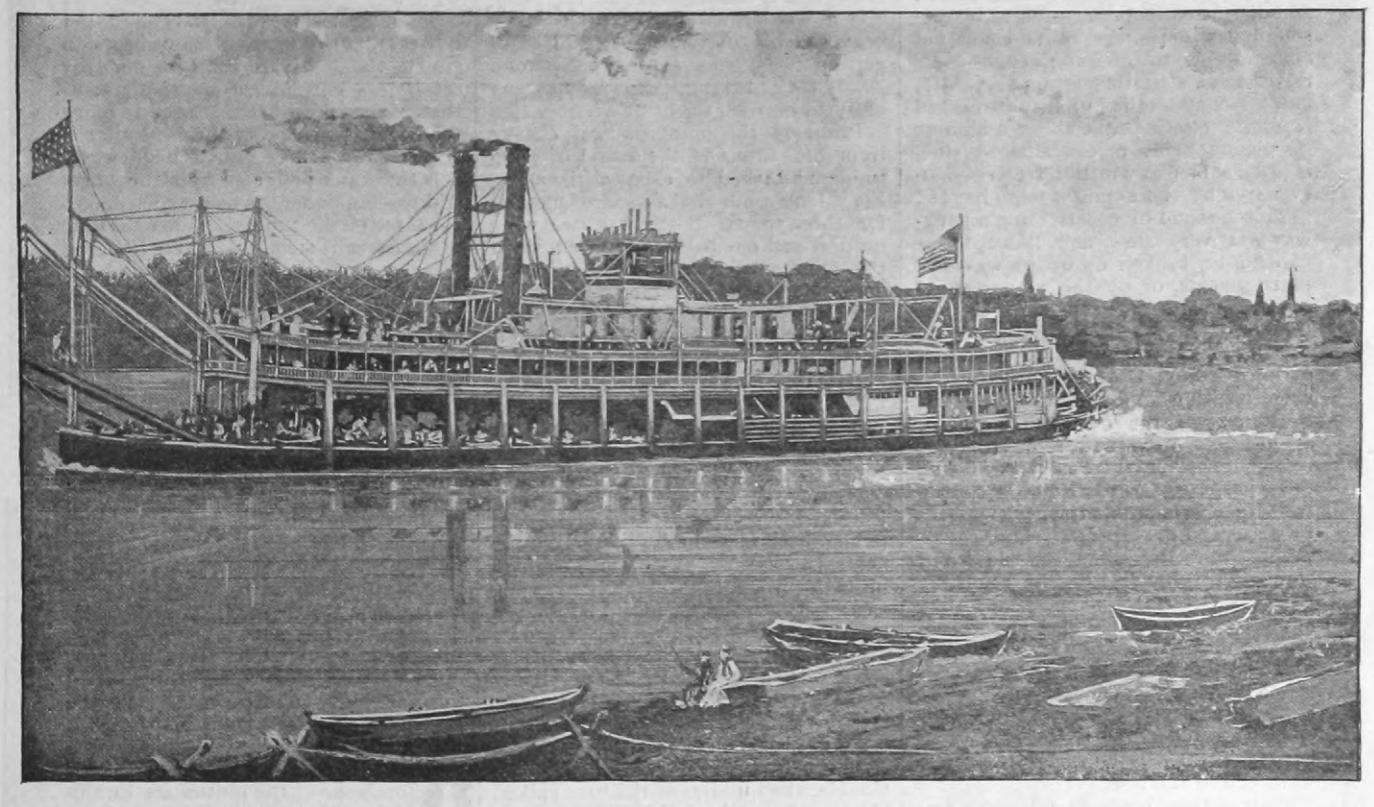
will turn around shorter than a boat of the same length, or raise with more safety in falls and in case of striking rocks. He has also made an engine with wheels that goes in a box, to be worked by one man, by sitting on the end of the box and tredding on treddles at bottom with his feet, set the wheels agoing which work scullers or short paddles fixed over the gunnels turning them around. The under ones always laying hold in the water will make the boat go as if two men rowed, and he can steer at the same time by lines like plow lines."

This was 25 years before James Ramsey of Berkeley County, Va., succeeded in propelling his flying boat, as it was called by the people, against the current of the Potomac at Shepardstown, by steam alone, at the rate of 4 or 5 miles an hour, and also 20 years before Fitch, in 1780, accidentally meeting Ramsey in Winchester, imparted to him his idea of propelling boats by steam.

After all, the preliminary experiments to which history, so far as recorded, gives full credit, seem to be preliminary to the practical results obtained by Fitch and Roosevelt, who, at Pittsburgh in 1810 and 1811, constructed a boat called the "New Orleans." This boat was 138 feet length of keel; her cabin was in the hold and she had port holes, also a bowsprit 8 feet in length (painted sky blue), in ocean style; her cost was $40,000. She was launched in March and descended the river to Natchez in December, at which point

S.S. R. R. HUDSON, 1865.

S.S. HUDSON, 1878.



Hosted by Google

she took in her first freight and passengers, and thence proceeded to New Orleans on the 24th of the same month. She continued to ply between New Orleans and Natchez until 1814, making the round trip in 10 days, conveying passengers at the rate of $25 up and $18 down. On her first year's business she cleared $20,000 net. In the winter of 1814 she was snagged and lost at Baton Rouge.

Until 1814 there seems to have been no attempt to return boats from New Orleans to the head waters of the Ohio River.

The "Enterprise" was built at Brownsville, Pa., and made two trips to Louisville; later in the year she proceeded toNew Orleans, carrying a cargo of ordnance, and she was for a time actively employed in transporting troops.

In 1817 this boat left New Orleans for Pittsburgh, and arrived at Louisville

S.S. HUDSON, 1886.

25 days out from New Orleans, which event the citizens of Louisville celebrated by a dinner to the captain.

In 1816 the "Washington," built at Wheeling, was the first boat to have her boilers placed above the deck.

In 1818 the "Independent," 50 tons, was constructed for the Yellowstone expedition, and was the first steamboat that ascended the Missouri River.

In 1819 the "Western Engineer" was the first boat to ascend to Council Bluffs, 650 miles above St. Louis.

The successful operation of these boats had, by this time, demonstrated what could be done, and from that time on the construction of boats for the navigation of these waters has been continuous.

The navigation of such streams as the Ohio and Mississippi rivers is a problem entirely distinct. On these Western waters only average results can be expected; boats must go, and make something near schedule time, whether the depth of the water is 30 inches or 30 feet, so that the first desideratum is minimum weight and maximum power, with all possible displacement of hull, per each unit of immersion, at all in keeping with anything like shape.

In boats designed for combined freight and passenger business the hulls are constructed with all the lightness in any way consistent with safety against falling to pieces, and the machinery must have small diameter of cylinder and boilers, and consequently must be designed for high steam pressure.

The character of the valve gear employed in the engines is particularly adapted to the class of boat being considered, because better fitted to the requirements of the service, the boats being very raftlike and limber; overloading at any point will distort their shapes; "tight on their chains" when without load, "slack on their chains" when loaded. So throughout the process of loading and unloading, one or the other effect constantly going on; these in turn perceptibly vary the distances between the center of the main shaft and rock shaft. Now, the lever valve gear allows this variation without seriously affecting the timing of the valve movement; no other form of valve arrangement gives this very necessary quality of stretching.

Gradually, through the past years, side wheel boats have diminished in number and tonnage, and stern wheel boats have increased. At best, any of these wooden boats are perishable, and the vast difference in first cost and the cost of maintenance of the side wheeler over the "wheelbarrow" boat has determined investments in favor of the latter; and while, to outside appearance, the stern wheel boat of to-day is identical with that of 20 years ago, it is only so in that particular. The method of hull and joiner construction is much the same. Models have materially altered, and have carried with them, or perhaps been caused by, broad changes in the application of the rudder or steering arrangements. This article, therefore, will be confined entirely to the stern wheeler, as representing the most successful and recent practice.

For some time after the use of steam propelled craft on the Western waters began it was considered impracticable to bring the boats to a landing without first bringing them to anchor out in the stream; a line was then taken ashore in the yawl, and the boat hauled to the bank by the shore line. When the boat left the landing a reverse of this operation swung her to the anchor cable; the anchor was then lifted and the boat proceeded on her way.

The method of procedure has been very much improved. Now, in making a landing (and it must be understood that in this navigation boats land on the shore, and not against a dock of any kind, in the majority of cases), the boat is headed for the shore, the machinery stopped and reversed until the headway is nearly checked, the remaining headway being sufficient to carry the boat to contact with the shore, and so the landing is accomplished. This practice is very much more expeditious than the old method, and has been brought about by the necessity of saving time in making landings, since the number of landings made by boats navigating these waters has vastly increased since their introduction. The writer has in mind a so-called trade between two points about 100 miles apart on the Ohio River. When the boats first entered the trade, some 40 years ago, they made a maximum number of landings, in a round trip between the points, not exceeding 35 or 40. At the present time boats in this same trade make never less than 150 landings, usually exceeding 200.

The banks of the Ohio River are fast being filled with railroads which parallel the stream. This development has increased the volume of business done in the valleys, and has increased the amount of water traffic, although largely changing its character.

Hosted by Google

Prior to the railroad development higher rates for service were charged by the boats than since, and the necessity existed for surplus boats of very light draft, which could be operated during the extreme low water in the river. When these boats were called into commission rates for both freight and passage were usually increased. At the present time the extreme low water boats are fast disappearing, because their navigation is attended with a considerable increase of expense over what might be called normal conditions, and the competing railroads prevent any increase of tariff charges by the low water boats over the regular normal charge.

One noteworthy labor saving device, which is now almost general on Western boats, is a method employed for handling the stage plank. Formerly, the stage plank consisted of rough boards about 18 inches wide, 3 inches thick, and 24 feet in length. These planks were pushed out by the deck hands, and in many instances—where by reason of flat shores the boats could not come in close to the water's edge—were rested upon a trestle set in the water, and a second section of plank reached from the trestle to the shore, a number of planks being placed side by side, making sufficient width to receive whatever freight there might be to handle.

This method of constructing a gangway was very slow and liable to be tripped or broken up by the waves of passing boats, or by the movement of the boat itself from which the gangway was constructed.

Of late years a gang plank has been adopted which is technically called a stage, varying in dimensions according to the size of the boat, but is usually about 8 feet wide and some 35 or 40 feet long. This stage is suspended in the middle, and is carried on a swinging crane which is attached near the forward end of the boat, and so arranged that the stage can be lifted through a tackle operated by a hoisting engine. Occasionally the stage is balanced by a weight, so that the use of the engine is dispensed with. On some of the boats two of these stages are used —one on either side near the forward end of the boat; but generally one stage is used for both sides, the derrick of the crane being in the center of the forward end of the boat.

Both of these methods will be understood by reference to the engravings of the steamers "Fleetwood" and the "R. R. Hudson," built in 1865; the "Hudson," built in 1878; and the third "Hudson," built in 1886. The boats are typical of the improvements of recent years, so far as the outward appearance is concerned, and represent a marked increase in dimension of hull, the "R. R. Hudson" being 180 feet long, 32 feet beam; the "Hudson," 200 feet long, 34 feet beam, and the last "Hudson" 235 feet long and 36 feet beam.

A story is related by some old boatmen that some time between 1820 and 1830 three men, who had been navigators of floating boats on the Ohio River, entered into a partnership for the purpose of having constructed a steamboat. The boat was to be 95 feet long. Shortly after the contracts were closed one of the parties to the enterprise proposed to increase the length of the boat to 110 feet. A meeting of the parties was held to consider the proposition, and two of them agreed that the length of the boat should be 100 feet; the third, not willing to consent to this increase in length, withdrew from the partnership, because he did not believe so large a boat could be successfully navigated through the crooked channels of the Ohio River.

These early ideas seem very faulty and are hard to understand, when we consider that in the present day the same channel of the Ohio River is navigated by boats 350 feet long, and by boats with tows rigidly attached to them, the length of boat and tow reaching as high as 900 feet, and would rather lead one to the reflection that perhaps we, with our ideas of progress to-day, are as wide of the mark as was the man who refused to invest in a steamboat 100 feet long for the reasons given.

The advances made in construction and methods have been almost entirely in small things, but make an aggregate result of some importance. Much larger tonnage is propelled with greater speed. Some fuel economies have been made, and the cost of operation and maintenance largely reduced. The boats are more manageable. Not so very long ago it was a great exception to find a boat capable of turning around or of getting away from shore when strong winds were blowing. Now almost any of them go with slight delay.

Probably the most radical change from old forms is the disuse of wing rudders attached to skegs at the stern. For a long time the standard method for three rudder boats was two wing rudders and one balance rudder; when the number of rudders was increased, one or more balance rudders were added, but the wing rudders and the skeg you had always with you. The best practice of to-day discards the wing rudder entirely, using only balance rudders—never more than four, usually three, and occasionally two, depending on the beam and other dimensions of the hull. When the balance rudder was first employed, that portion of the blade projecting forward under the stern rake (when fitted close to the bottom, in the neutral position of the rudder) presented in its operation a constantly increasing space between the blade and bottom of the boat, as the rudder advanced to its extreme position on either helm. This space was objectionable, because likely to catch drift, and so foul the rudder; also, because it was thought the opening diminished the effectiveness of the rudder. In order best to relieve this trouble, the builders of the time spiked blocks of wood against the bottom plank, being careful to have the blocks thick enough, and then reduced them to a shape discovered by hanging a skeleton rudder in position and traveling it as they cut; this was technically called "building a bustle on." It did not last, however, very long—something like 15 years—until some one, lost to history, discovered it possible to form the frames or floors composing the stern to the desired cone shape, and dispense with the blocks of wood. This was a great stride, and soon became the rage, and was termed "building a bustle in." It is the practice to-day of those designers who think there can be no improvement.

Coeval with this practice was the use of a very short and steep rake to the stern of the boat, insisted on because it was popularly supposed to increase the bearing of the hull and induce a consequent lighter draft, as well as better to sustain the weight of the wheel machinery, which on the stern wheel boat was necessarily at the stern end. It is only in recent years that a probably better conception of the laws governing the propulsion of such boats has induced retirement of the wing rudders, and a longer and more acute stern rake. The two are closely connected, because primarily the measure of the propulsion of the boat in either direction is the measure of the resistance of the body of water moved by the wheel in the opposite direction. Now, the wheel must be supplied with new water as fast or faster than it displaces it, so that, when the boat is being moved ahead, if the shape retards a free delivery of water to the wheel, a very bad application of power results.

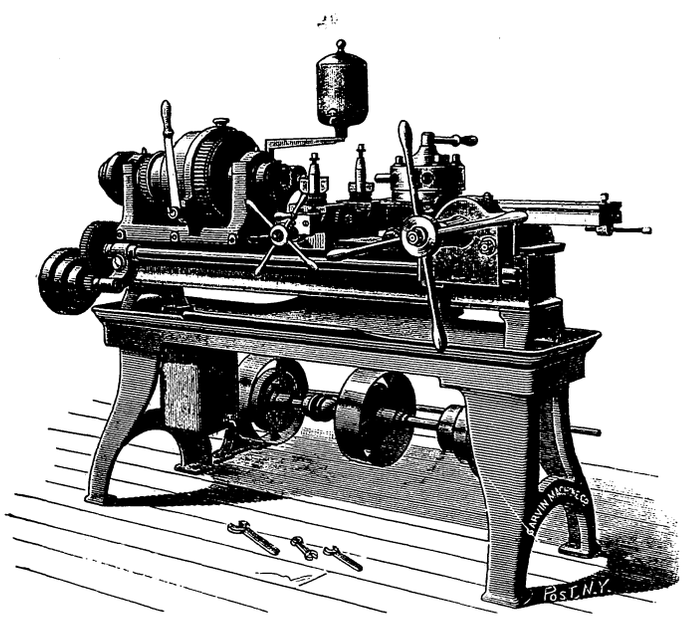
In the bustle form of stern the appearance of the water when the boat is moving is very favorable, often smooth and clean, and without breaks between the wheel and stern rake, as well as around the outside of the hull; and many consider this surface condition to indicate proper shapes. However, a chip or block dropped into the water alongside of the boat, some 30 feet from the stern, will usually go under the boat in its effort to get to the wheel.

These boats depend entirely on rudder power to govern their movements in steering, and this can only be done by creating a current on the rudders; so that, when the wheel is used to move the boat astern, and at the same time it is desired to deflect the stern sideways, it is the water delivered from the wheel and passing under the boat which makes the force on the rudder. When the rake of the stern is steep the water from the wheel is banked against the end of the boat and reacts upon the rudder, causing the frequent deflection of the stern in the opposite direction to that desired.

In adopting designs for stern shapes, as shown, and making that shape the reverse of the bustle, it is still possible to preserve an approximate contact between the forward rudder blade top and the bottom of the boat. This is secured by discarding the old method of setting the rudder post and pintle square with the keel line, substituting a position at right angles to the plane presented by a rise of the rake at the station met by the under blade; so that the pintle and rudder stock and post pitch forward from a right line with the keel, and rudders other than the center one pitch also sidewise to meet a right line with the thwartship deadrise of the bottom at the same point; therefore none of the pintles are in the same plane, and a ball joint is used on the tiller to connect the coupling bar common to all of them. A further guard against fouling the rudder action is in the opening left between the top of the rudder blade and the bottom of the hull, whereby any drift forcing in is soon relieved by the enlarging opening. The success of this plan has proved that the idea insisted on to have no current pass over the blade was a mistaken one.

The models for forward body or bow form are usually subject as much to the character of the craft as anything else. For a freight boat loading heavy weights on the forecastle, a shape very full in harping adds increased bearing as the load increases, and at the same time allows sufficient cutting away in the first 2 feet to properly balance the boat when in light trim. Boats used exclusively for towing may be sharper in order to properly load with fuel carried almost exclusively amidships.

The best general shape seems to be that in which well-defined rising lines are found, so that the displacement is made downward rather than sidewise. This increases buoyancy when the hull is driven hard, and holds the head of



Hosted by Google

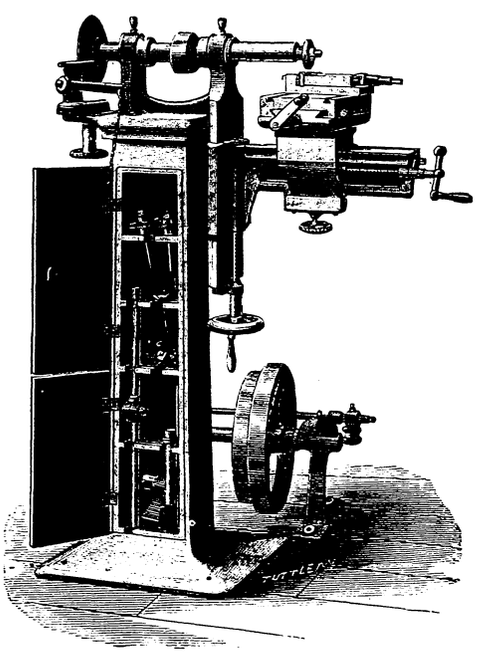
the boat up against burying; while the wall sided forward model seems to account for cases where the same hull, with larger driving power developed, actually showed a decreased speed.

Garvin Screw Machine and Universal Cutter and Tool Grinder.

The screw machine here illustrated is provided with geared friction head and power feed to the turret. The feed shaft extends along the front of the machine and is driven by a three-step cone, giving the necessary changes. The feed gears of the turret are also placed in front and are neatly incased to protect them from chips and dirt. The handle for operating the feed latch is conveniently placed on the side of this case. The turret slide is operated by the pilot wheel when desired, and has an automatic feed of 9 inches, which may be set to trip at any point in the travel by an adjustable stop on the slide. The cross slide is operated by a screw and pilot wheel and is fitted with two tool posts, each of which has an independent adjustment sidewise by means of screw and knurled handwheel, insuring ease and accuracy in setting the tools. When desired the machine is furnished with wire feed or with plain cone, plain back gears, and without power feed to the turret. The principal dimensions are :

Largest diameter of cone, 12 inches; width of belt required for geared cone, 3 inches; for plain cone, 3¾ inches; diameter of spindle, 3¼ inches; capacity of spindle with wire feed, 1⅛ inches; without wire feed, 2⅛ inches; swing over bed, 17 inches; length of bed, 6 feet; diameter of turret, 9 inches; number of holes in turret, 6; diameter of holes in turret, 1¼ inches; length that can be milled, 9 inches; friction pulleys on countershaft, 14 x 4 inches; speed of countershaft, 150 revolutions; weight complete, 1900 pounds.

GARVIN SCREW MACHINE.



Universal Cutter and Tool Grinder.

This machine has been improved recently, and it now embodies several new and valuable features. The front bearing is extended, forming an outboard support for the end of the spindle, thus preventing any vibration. The spindle is hollow, and is provided with a rammer for removing the arbors. The rear end extends beyond the bearing and is arranged to carry emery wheels up to 8 inches diameter. A rest is also provided for grinding small drills, light tools, gear tooth cutters, &c. The guide finger is fixed in a yoke which clamps around the end of the front bearing, giving a wide range of adjustment and being quickly and easily set.

The surface grinding attachment is secured to the sliding carriage by a dovetailed swivel plate, and is securely held at any angle by a cam binder. The actuating mechanism is conveniently operated either from the end or side of the table, the travel being regulated by adjustable stops on the side. A vise is furnished for use in connection with the sliding table, for holding flat work. The column base is fitted up as a cupboard with wood shelves for holding all the fixtures, wheels, &c. The machine will grind mills of 20 inches diameter and 6 inches face, and grind a surface of 8 x 10 inches.

The main dimensions are: Vertical adjustment of knee on column, 6¼ inches; adjustment of sliding table in line with spindle, 6¼ inches; travel of surfacing table, 10 inches; tight and loose pulleys on counter, 4½ x 2 inches; weight, 400 pounds.

Both these machines are made by the Garvin Machine Company of Laight and Canal streets, New York.

GARVIN UNIVERSAL CUTTER AND TOOL GRINDER.

The fire loss of the United States and Canada during September amounted to no less than $10,508,700, which, although a decrease of $2,714,000 from that of August, still shows a serious increase, amounting to $2,628,900, over the loss of September, 1892. The total value of property destroyed by fire for the first nine months of the present year now reaches the enormous figures of $120,832,700, or over 25 per cent. greater in the aggregate than those of the same period in 1892.

WORLD'S FAIR NOTES.

W. Osterlein

of Cincinnati exhibits friction clutches at Column J 28, Machinery Hall. Three sizes are shown, the largest being adapted to very heavy work and the others to light work. The shafting to which these clutches are connected is mounted on floor stands, but not supplied with power.

A. Falkenau

of Philadelphia exhibits lathes, grinding machinery, &c., at J 39, Machinery Hall. A 14 inch lathe is shown as a specimen of fine construction, embodying throughout the best materials and the highest class of workmanship. It is extra heavy with metal well distributed for strength and stiffness, has all parts subject to bruising wear case-hardened, the gearing is accurately cut from the solid, the sliding surfaces are accurately scraped to a bearing, with no emery used in fitting, and with ordinary change gear it will cut all threads from 2 to 16 and even threads from 16 to 32. A 14-inch lathe is shown with a turret slide, the lathe having a 4-foot bed. The turret head is mounted on a slide, taking the place of the regular cross feed slide of the lathe. It is turned by hand, can be securely locked in its various positions and is furnished with stops to accurately size the work, while it can be locked in a central position for drilling, &c. The turret slide can readily be exchanged for a plain tool rest. The lathe can thus be used on a large class of work for which the more expensive automatic turret machines are not suited. The Taylor automatic tool grinder, shown in this exhibit, is a machine designed for grinding lathe and planer tools, as conducted in establishments in which one man or a boy does all the grinding, instead of each man leaving his machine to go to the grindstone when his tools are dull. The operation of this machine may be thus described: On an adjustable platen in front of the stone is a tool holder in

Hosted by Google

which the tool is fastened by a gear operated by a hand wheel. In the tool holder, directly over the tool to be ground, is placed a sheet steel former of the shape desired for the tool. The former rests against a hardened steel apron, attached to the head of the stone and made adjustable in and out. When the former bears against the apron the tool comes in contact with the stone. The former is held against the adjustable apron and the tool against the stone by means of a yoke and counterweight controlled by a treadle. Tools are thus ground to a uniform or standard shape. A universal and cutter grinder is also shown, which covers the whole field of accurate grinding of machine parts, milling and gear cutters, reamers, &c. A vertical belt pump, for boiler feeding, is shown in operation. This pump has a long plunger and a long connecting rod. The suction valve is furnished with a by-pass, so that the pump can be run continuously.

The Sherwood Mfg. Company

of Buffalo, N. Y., have an exhibit at K 25, Machinery Hall. Although occupying small space, they have used every available inch to such excellent advantage that it attracts more attention than some of the larger exhibits.

A small figure of Uncle Sam seated upon an iron pedestal works a Buffalo automatic cylinder oil pump with one hand and a Buffalo duplex flue scraper with the other, while with his feet he turns a handsomely nickel plated pedestal on which each alternate wheel is of lacquered brass. The pedestal holds glass oil and grease cups, hand oil pumps, lubricators and ball gauges, cocks, the entire pyramid being topped by a glass oil cup. On the railing which fronts the exhibit they have samples of the Sherwood and Buffalo automatic injectors. A 6-foot column of flue scrapers varying in size and branching into four arms at the top occupies a position of prominence. The Favorite flue blower is shown in various sizes, completing what is one of the most tasteful small displays of the entire machinery exhibit.

The Keasbey & Mattison Company

of Ambler, Pa., have an exhibit in Section D of the boiler house annex, Machinery Hall, where they have erected a neat and serviceable platform, around the outer edges of which showcases have been built containing specimens of their magnesia sectional steam pipe covering. It is composed of magnesia and asbestos and is intended for all manner of steam pipe, both high and low pressure, and also for boilers. It is further available for connections and fittings separately.

Beaman & Smith

of Providence, R. I., builders of milling, boring and special machinery, have on exhibition at Column K 47, Machinery Hall, a horizontal spindle milling machine, a heavy standard milling machine, floor and standard drilling and boring machines and a safety drill and tap holder. The milling and boring machines cover the leading types of machines of this character manufactured by the firm, and are shown in operation. The horizontal spindle milling machine is intended for long and heavy cuts, such as guide bars, connecting rods, key seating shafting, axles up to 10 inches diameter, &c. The heavy standard milling machine is intended for general machine shop use, but on larger work requiring larger cutters and taking deeper cuts than usually attempted on milling machines of its type. The drilling and boring machines are of the horizontal type and are designed for drilling, boring and tapping a great variety of work. These machines are all of a high order of merit, but their safety drill and tap holder specially warrants a detailed description. The holder consists of a body with a taper shank to fit any machine having a revolving spindle, threaded on the outside and recessed to receive a socket held between two pieces of vulcanite fiber. A cap is screwed on over the socket and adjusted so that there is sufficient strength to drive the tap. A drill socket is held in the friction socket by a pin and is driven by feathers, the tap and its socket is held in the same manner. The taps being held loosely they cannot cut larger than themselves, and being driven by feathers, by feeding out and in themselves they cannot cut or strip the thread by careless hand feeding. On reaching the bottom of the hole the friction slips and the danger of breaking the tap is reduced to a minimum. The change from the drill to the tap socket can be instantly made without stopping the machine.

In the east gallery of the Mines and Mining Building are a number of exceedingly interesting exhibits, comprising graphite and its applications, abrasives, fuels, &c. All are more or less attractive, either by reason of the taste and ingenuity shown in the arrangement of the exhibits or else by the special character of the products displayed. An exhibit which combines all these characteristics is that of

The Joseph Dixon Crucible Company

of Jersey City, N. J. They have erected a very artistic *façade* of cherry and mahogany to mark the boundary of their space, which is richly furnished with fine carpet and handsome show cases, while numerous chairs have been provided for the hospitable reception of visitors. Arranged in the showcases are products of graphite in many forms, such as crucibles and silver and gold retorts, from No. 0000 up to No. 300, dippers, bowls, stirrers, nozzles, stoppers, electrical appliances, forms for incandescent lights, electrotypers' facings, founders' core wash, foundry facings, shot glazing, graphite lubricants, machinery oil, cylinder oil, inside and outside grease, dry lubricants, roof paint, boiler and smoke stack paint, yacht graphite, hatters' lead, pigment for paint, flake graphite, &c. These exhibits are in many instances arranged in glass jars, with richly enameled labels. One showcase contains specimens of graphite in special shapes, such as great bunches of pencil leads in all shapes and thicknesses, and resistants for electrical purposes in bars, coils, rings, rods, &c. On a mahogany table stands a Dixon crucible which was used at the American Bronze Works, Grand Crossing, Ill., in casting the solid silver statue of Justice for the Montana display in the Mines and Mining Building. The finest specimen of graphite ever mined, according to experts, is here exhibited, and an award has been granted the company on that ground. It weighs 269 pounds, and is said by mineralogists and chemists to be at least 98 per cent. pure. It was mined on the island of Ceylon. Numerous other specimens of graphite are shown which run up to almost 100 in fineness. The company's graphite is principally obtained from their own mine at Ticonderoga, N. Y. So little is known of graphite by the general public that the company's representative in charge of the exhibit, John H. Baird, may be said to be delivering a perpetual lecture on this useful mineral to a stream of visitors. The special lead pencil display of the Jos. Dixon Company is located at Column F 98 in the northeast gallery of Manufactures Building. It occupies a small space, but the exhibit is nevertheless a very fine one. Samples of lead pencils in almost every conceivable shape and size are tastefully arranged on a four-sided frame in a handsome glass showcase. Returning to the Mines and Mining Building, another exhibit in the east gallery worthy of mention is that of

Robert J. Taylor & Son,

Nineteenth and Callowhill streets, Philadelphia, who show a great variety of crucibles and retorts for all purposes. These are arranged on a set of shelves, receding from very wide ones at the bottom to narrow ones at the top, to accommodate the different sizes of crucibles. A much larger display, however, in the same line is that of the

Phœnix Crucible Company

of Taunton, Mass., who have erected a great pyramid of shelves, crucibles of all sizes completely covering the four sides. Banners prominently displayed state that this is the oldest incorporated crucible manufacturing company in the United States. A large gilt phœnix surmounts this exhibit. In close proximity

The Carborundum Company

of Monongahela, Pa., make an interesting exhibit of a new abrasive. Carborundum is a recently invented material for this purpose due to the experiment of Edward G. Acheson. It is a compound of carbon and silicon, obtained through their fusion by an electric current. The material thus produced is crushed and sifted into different sizes. Very small but highly brilliant crystals are the result. Experiments of the most exacting character have been made with this material and its properties have been shown to be more nearly those of the diamond than of corundum. Its production thus far has been limited and for some time it was used in making very small grinding and cutting wheels, such as dentists' wheels, for which it proved to be superior to emery. It was also introduced in the form of powder for fine polishing, and notwithstanding its greater cost was shown to be able to compete with emery on account of its longer service. The production is now up to 200 pounds per day and it is being used for a wider range of grinding and polishing. Wheels of good size are being made for use in competition with emery wheels. A peculiar property of this abrasive is that it does not burr a tool or draw the temper, but can be used either wet or dry. This is explained on the theory that carborundum is an excellent and rapid conductor of heat. The manufacturers advise the use of a finer grain in carborundum than in emery. For instance, they suggest No. 70 in carborundum to use for the same work as that done by No. 60 in emery, the degrees of fineness being numbered in the same manner as emery. Next comes a remarkably interesting exhibit by the

Pittsburgh Crushed Steel Company, Limited,

of Pittsburgh, Pa., who display another artificial abrasive of a totally different character, which they style

Hosted by Google

crushed steel and steel emery, according to its degree of fineness. It is made from high grade and very high carbon crucible steel, each particle tempered to a proper degree to give it a cutting edge. The shape is irregular, so that no two grains are similar, and in wearing off one edge another is thereby produced until entirely worn away. The manufacturers claim that it will not pulverize, but must be worn out. It is assorted in all sizes from very coarse grains to a fine powder. So fine is the latter made that it is used for polishing the most expensive lenses. The coarser grains are used for solid core drilling, sawing, granite, onyx, bluestone, marble, sandstone, limestone, &c., while the finer are used for rubbing stone, polishing glass, metals, brick, tile, &c. Beautiful specimens are shown of the work done with crushed steel in sawing, cutting and polishing stone. Among them are long, slender rods of marble, which would be very expensive if produced by methods ordinarily in vogue. Samples of the material are exhibited which have been in constant use for seven months and are still in condition for much more service in cutting and grinding. A truly magnificent display of abrasives is next made by

The Tanite Company

of Stroudsburg, Pa., which can be best described by quoting from a circular prepared by this company. They were requested by the exposition authorities to treat "abrasives" from an educational standpoint. The exhibit here illustrated and described is the result, and its compact character is due to the fact that the exhibit will be presented as a gift to the Smithonian, the Chicago University, or some other suitable institution. While some of the articles were furnished by the Tanite Company many were contributed by liberal minded manufacturers.

Emery, being the most important abrasive, is illustrated fully. Emery ore is shown from Turkey, Greece and the United States. In one piece clear blue sapphire can be seen with the naked eye. On a platter of pure aluminum are shown sapphires, corundum and emery, with the explanation that alumina is the oxide of aluminum, and that the articles on the platter are largely composed of crystallized alumina, the sapphire being almost pure alumina. Emery is then shown in its successive stages—first as it comes from the crusher; then in the form of grain and flour; then as polish (powder, liquid and paste); and, lastly, in the shape of whetstones and solid emery wheels. Fragments of various classes of Tanite wheels are displayed to show the internal texture. There are bottles containing the dust gathered under Tanite wheels after the grinding of cast, malleable and wrought iron, and of brass and steel. These are for experimental examination with magnifying glass and magnet. "Petrified sparks" are an interesting feature. These are strangely shaped cones formed of the matter which fuses below an emery wheel when grinding under heavy pressure. The comparative products of the emery wheel, file and cold chisel are tabulated on a framed sheet, while the case contains pieces of cast iron and saw steel with the cuts made by file and wheel. The piece of saw plate demonstrates that in a given time the wheel did 126 times as much work as the file. In the case and on the ends of the stand are numerous parts of machines, all of which have been surfaced by the Newman emery plater. These appear to be as true as if planed, and tabulation shows that this machine has taken a maximum cut $\frac{1}{4}$ inch deep, and has taken a $\frac{1}{16}$ inch cut over a surface of 100 square inches in six minutes and nine seconds. Its ordinary cut is from $\frac{1}{64}$ to $\frac{1}{32}$ inch.

Emery wheels are usually thought of in connection with metal grinding, but in this case are shown blanks for long combs and ladies' back combs, made of vulcanite, and other samples showing that the long comb has been edged and the back comb had the spaces between the teeth cut out with Tanite wheels. Glass guides from a silk spinning mill are also shown. In these guides the silken thread wears a tapering groove which eventually breaks the thread, and these grooves are ground out by the use of Tanite wheels.

As curious and instructive examples of abrasion, the parts of various machines used in the Tanite factory are shown, all testifying to unequal and destructive wear due to unequal stress and the friction of emery dust.

Corundum is shown from Ceylon and from our Southern States, in the form of mineral samples, and also in grain. To the latter samples, as also to some of the emery samples, are attached analyses showing the proportions of insoluble corundum, of dissolved alumina, &c. Samples of pumice stone and of rotten stone are contributed by T. Van Amringe of New York. Baeder, Adamson & Co., Philadelphia, show rock flint or quartz and rock crystal garnet in rock, in grain and on cloth. Norris & Brother, Baltimore, exhibit India spar. B. C. & R. A. Tilghman, Philadelphia show chilled iron shot. The Pittsburgh Crushed Steel Company show a full line of samples of their so-called steel emery, and the Carborundum Company show that material rough and finished. Millstone rock is shown by W. & F. Livingston and by Samuel Carey, both of New York. Wm. M. Kirby, Pittsburgh, shows grindstone rock, as do also J. Westby, Levick & Co., Sheffield, England. J. B. Hull, Stroudsburg, shows, in regular order, the materials used in rubbing down granite and marble. Scythe stones, rough and finished, are displayed in great variety by P. M. Peterson & Son, Porsgrund, Norway. The Pike Mfg. Company of New Hampshire also show a great variety of natural whetstones, &c. D. A. Richardson, Helena, Mont., contributes rough sapphires and A. W. & C. E. Tanner, Red Bluff, Mont., some fine specimens of garnet. Corundum is supplied to this exhibit by Ed. L. Hand & Co., Philadelphia, and by Geo. L. English & Co., New York. Among the curiosities of abrasion are the following: Leaves of the afeen plant, used to clean gourds after the manner of sandpaper, contributed by Bolding Bowser, U. S. Consul, Sierra Leone, Africa. Wood of Agave Polyacantha, used for razor strops, contributed by Wm. P. Pierce, U. S. Consul, Trinidad. Dutch rushes or scouring rush (*Equisetum Hyemale*) from Yorkshire, England, supplied by David Brodie, M.D., London, and rush for same purpose furnished by John Selwood, Stroudsburg, Pa. The epidermis of these plants is formed of silica and the rush is used to polish wood and metals. Shark skin is contributed by the Tanite Company. This is to be used in same way as emery cloth and sandpaper.

Samples of carbon or black diamond and also samples of clear or gem diamond, suitable for turning or dressing emery wheels, are shown by the Tanite Company. The evolution of razors and table knives is shown in two series of samples, beginning in each case with the rough ingot or blank of steel, progressing through various stages of polish to the final bright finish.

An interesting series of photographs shows emery veins and mining processes in Westchester County, N. Y.

After showing how wide a range of materials and processes is covered by this compact and unique exhibit, we can close in no better way than by referring to two pictures: One of these seems to represent the tail of a comet, though what is really shown is the stream of fiery sparks streaming off from a Tanite emery wheel while engaged in grinding through a file. The other is a photograhic reproduction of a picture in the Royal Gallery, Berlin. The photograph was contributed by Markt & Co., Hamburg, and the painting was by Gerard Ter Borch, who was born in Holland in 1617. This painting represents with much detail "The Grinder's Family," and depicts clearly the rough and primitive grinding processes then employed.

The many articles already mentioned form only a part of this exhibit; but enough has been said to show how much unexpected interest, even for the unlearned, may be found in an exhibit whose name suggests nothing but a dry, hard, technical study.

H. W. Johns Mfg. Company

of New York, Chicago, Boston, Philadelphia, Atlanta, Jersey City and London, have six exhibits of their specialties, owing to the variety of claims covered by their productions. In the Mines and Mining Building they have machinery in operation manufacturing asbestos fabrics, on the ground floor in the northeast corner of the building, Section Q. In the same building, in the northeast gallery, Section T, Column 11, they exhibit a collection of asbestos minerals from all parts of the world. In the Electricity Building, west gallery, Section U, they show insulating materials for electrical purposes, vulcabeston, &c. In Machinery Hall asbestos pipe and boiler coverings are in actual use. The feed pipes for 70 engines and about 50,000 feet of main steam supply pipes are covered with asbestos sectional coverings. In the great Manufactures Building paints are shown on the ground floor in the northwest part of the building, Section H, Block 1, while the general exhibit of the manufactures of the company is located in the gallery in the northeast corner, Section F. This last exhibit covers an enormous variety of asbestos goods, such as drop curtains for theaters, fire proof building paper, gaskets for pipe joints, pipe coverings, &c.

B. & S. Massey

of Openshaw, Manchester, England, exhibit in the British section of Machinery Hall, at Column K 6, several full sized steam hammers and some small working models of their hammers. One of the full sized hammers is a 1½-hundredweight self acting and hand worked steam, with loose adjustable slides and overhung framing, the stop valve being controlled by a foot lever and hand lever at will. The slides are separate from the standards and made adjustable to take up wear. The trip or hammer head is accurately grooved and works between these guides, which also support it, taking the strain off the piston rod, especially when subjected to side thrusts. The anvil block is accurately turned to fit the bored out hole in the base plate, which is of importance in

Hosted by Google

preventing all lateral movement. It is provided with a strong key to prevent its turning round. It is fitted with a loose anvil top of best crucible steel, also a palette or hammer face of the same material. The loose top can be easily removed when more space is needed under the hammer, or it can be readily repaired or replaced when worn or broken. The hammer is so perfetly under control that it can be made to deliver long or short, quick or slow, heavy or light blows, instantly and without stopping. Another full sized tool is a 3 hundredweight special steam stamp, for stamping in dies. It has specially arranged gear for the purpose, and is also fitted with self-acting gear for forging, which can be thrown in or out of gear as desired, and patent loose adjustable slides and patent buffer arrangement complete, with massive base and tool holder. It is useful for dishing and hollow ware generally. The principle on which the slides are made is new and has just been patented. They are so constructed that the wear on the slides and tup can be taken up. Not being in one piece with the standards they can be readily replaced. The patent adjustable buffer limits the upward stroke of the piston to any required hight, thus insuring a regular and even blow for different classes of work. When lowered for short strokes the buffer fills the upper part of the cylinder and prevents the steam from needlessly filling this space, which economizes the use of steam. The valve gear is simple and efficient. When being used for stamping, as the steam is turned on the tup instantly rises to the top of its lift and remains there until the hand lever is pressed, when it at once delivers its blow and rises, leaving the lower die clear for the removal of work. Three small models of steam hammers are shown worked by compressed air. They are made accurately to scale to represent different types of hammers. Photographs are shown of different styles of hammers, with specimens of actual forgings made.

Peter Wright & Sons

of Dudley, England, exhibit at Column K 6, in the British section, Machinery Hall, 112 samples of their famous "solid wrought" anvils, ranging from 30 pounds to 648 pounds, made after a patent process. It is claimed that they cannot be broken by ordinary usage. They have a grade of finish peculiar to the firm. Every anvil is tested by a member of the firm as to soundness, hardness of face, &c. The Government test of hardness is that a new second cut file shall just touch the face, and all these anvils must conform to it. All are made of forged scrap iron, and are forged under Massey's hammers. Thirteen vises are also shown made of fagoted scrap iron, BB iron and steel jaws. The worm and box are cut from the solid by a patent process. There are seven leg vises and six parallel vises. The leg vises range from 31 pounds and 3½ inch jaw to 209 pounds and 8-inch jaw; the parallel vises from 3½ to 8 inch jaws. These vises are peculiar in having a very long pin, so that when the jaws are spread to their full opening the screw on the end of the pin still fills the box. They are further stiffened and strengthened by a ⊥-shaped slide under the pin, also made very long. The vises are shown attached to a long bench, while the anvils are displayed on a platform having several steps. The anvils include saw makers', farriers', plow makers' and the regular smiths' patterns. Their total weight is a little under 20,000 pounds. This entire exhibit has been sold to Jones & Laughlins of Chicago.

The Electrical Forging Company

of Boston, Mass., make one of the most novel exhibits at the exposition. The operation of heating and working metals by electricity on the Burton system is shown on quite a comprehensive scale in Electricity Building, Section D, Space 2, in the northeast quarter of the building. Appliances for forging, welding, rolling, brazing and for rolling balls and taper pins are in regular operation. One of Merrill Bros.' large drop forges is used for the manufacture of miniature horseshoes, which are in eager demand by spectators for souvenirs. Everything is done by electricity, the machines being operated by an elecric motor. A large electric heater with several metal holders is used for heating bars for forging, rolling and welding, also for welding tubes or pipes. This heater is so governed by a regulator or rheostat that pieces of different diameters and varying lengths are heated at the same time, the heater dividing its current automatically. Iron or steel or copper can be heated easily and in a remarkably short time. The holders for heating bars to be rolled into balls are located close to the rolling machine. There are four of these holders, so that the operator can be kept supplied with heated rods. The metal thus heated is not oxidized, and the most ignorant workman is in no danger of burning it. Experiments of many kinds were made in the presence of the writer to demonstrate the remarkable mildness of the heat thus applied. A striking peculiarity of the heated bars is that at a white heat the part of the metal not exposed to the electric current is quite cold within a very short distance of the heated portion. A portable heating apparatus is shown, which is adapted for use in heating rivets in the construction of buildings or in other isolated locations. A bucket containing water is connected with one pole of an electric current, which may be taken from an electric light, a trolley wire or other convenient source of electric energy. A pair of tongs is connected with the other pole. A piece of metal held by the tongs being dipped in the water the circuit is completed and the metal at once begins to heat. It will melt if kept in the water any length of time, the action being very rapid. A jacket of hydrogen, it is explained, is generated which envelopes the metal and protects it from the action of the oxygen, so that the iron or steel is not injured by the heat as applied in this manner. A piece of steel held in the water until the end fused was found to be unburnt after it was allowed to cool. A medal and diploma have been awarded this exhibit "for originality, rapidity in placing and removing the metal to be heated and adjusting the heating devices to varying sizes, shapes and lengths, and for original and superior construction and apparatus."

The Pratt & Whitney Company's

exhibit occupies a very large space at Column J 44 and 45, Machinery Hall, comprising machine tools in operation and a great variety of small tools in showcases. There are eight large show cases, filled with beautifully finished tools that make machinists' eyes water. These comprise a

Set standard cylindrical size gauges, plugs and templets, ¼ inch to 2 inches by sixteenths, in case.

U. S. standard thread gauges; M. C. B. standard limit gauges.

M C. B. standard gauges for automatic couplers; standard drop forged caliper gauges; standard hardened mandrels.

Standard hand, shell, chucking and taper reamers.

Set Am. Ry. M. M. Assoc. wheel center and tire gauges.

Car wheel circumference gauges, M. C. B. standard.

Gear cutters, milling cutters, &c.

Taps, U. S. standard, dies, die stocks, boiler and stay bolt taps, punches, Kennedy and plain, and hand punching machines, hand shearing machines.

Counterbores, cutting off tools, threading and lathe tools and small tools of every description ordinarily required in modern machine shop equipment.

Sets of gauges are also shown in other cases, being kept under key to prevent them from being handled.

Milling machines are a prominent feature of the display of machine tools. Many kinds of work are now done by milling cutters of special form or special application very much more rapidly and accurately than by old methods.

Much interest is excited among visitors in a new plain chucking machine fitted with tools for brass cock and key manufacture.

The gun making machinery is a novelty to most people. Here are shown gun barrel drilling machine, gun barrel reaming machines, and gun barrel rifling machines. The operator of the gun barrel drilling machine can, without any particular effort of mechanical skill, drill a continuous hole through solid stock, and if conditions are what they should be there will be found little deviation from a straight central bore of uniform size. No particular apparatus is required for starting the drill, neither is any straightening required during the operation, and little or none until after the proof reaming. The machine is double and has a horizontal bed. The heads are at the end and have mounted in them independent spindles parallel to each other. On their inner ends are chucks for securing and rotating the barrels in the adjustable rests which support, guide and control the starting of the drills, which are secured in the sliding carriages. These are fed positively 38 inches by a screw having automatic stops. The screw has a variety of speeds through change gearing, in order to compensate for the different qualities of stock to be drilled. Two rotary pumps (one for each barrel) force oil, supplied from a tank placed underneath the machine, through a series of tubes into and through the drill. The oil lubricates the cutting lip and forces out the chips into the basin on top of the tank, where they are drained, and the strained oil returned to be pumped again. Rifle barrels 30 inches long, 0 3 inch bore, can be drilled (with each spindle) in 1⅛ hours; the same length, 0.76 inch bore, in 1¼ hours.

The very accurate scales on which the machines of this company work cause many expressions of surprise and admiration from foreign engineers.

The company make a special exhibit, at another part of Machinery Hall, of their automatic grain weighing machine and bagging machine.

Geo. M. Bond is in charge of the exhibit.

Hosted by Google

The Illinois Iron & Bolt Company

of Carpentersville, Ill., make a fine exhibit of letter presses in the northeast corner of the gallery of the Manufactures Building, Column F 94. The collection comprises hand wheels, levers and double hand wheels for heavy work. Huge presses are shown for taking impressions of very large sheets. The large presses are handsomely decorated, and trimmed with nickel plate. There are a number of specimens of presses of the ordinary office size in a variety of styles and kinds of finish.

McIntosh, Seymour & Co.

of Auburn, N. Y., have in operation in Machinery Hall, running dynamos for the General Electric Company, a 1200 horse-power double tandem compound engine, which is receiving much commendation. This engine is equipped with a governor which is remarkably sensitive, quickly controlling the action of the engine on varying loads. The special features of the engine are that the main valves are of the piston type, with adjustable seats and auxiliary cut off valves driven by the governor; all valve gear is driven from detachable drag link shafts; copper heating coils in the receiver are fed from the high pressure cylinder steam jackets; water jackets are applied to guides and main bearings; ball and socket main bearings are provided with oil settling chambers and circulating pumps for continuous oiling. The dimensions of the engine are as follows: Diameter of high pressure cylinder, 18 inches; diameter of low pressure, 32 inches; stroke, 36 inches; speed, 112 revolutions per minute; steam pressure, 125 pounds condensing; main bearings, 24 inches long by 14 inches diameter; diameter of shaft between bearings, 16 inches; fly wheel, 16 feet in diameter and 78-inch face; weight of fly wheel, 62,000 pounds; total weight of engine, 250,000 pounds.

The Electric Traveling Crane,

built by the Yale & Towne Mfg. Company of Stamford, Conn., that did so much of the work of installing the exhibits in Machinery Hall and is now carrying passengers, has become as popular as a means of obtaining a bird's eye view of the hall as is the Ferris wheel for a general view. It has received an award from the John Boyd Thatcher commission. In addition this company have received individual awards on the locomotive crane in the Transportation Building, on the 10-ton pillar crane, the triplex block, the duplex block, the safety double lift hoists and the crabs and winches in Machinery Hall, every machine shown by the company thus receiving an award entirely on its own merits, the excellence of the company's products being thus emphasized and indorsed in the strongest manner possible within their power by the Board of Awards.

Hemenway & Browne, New York, exporters of American products to West Cost South American ports since 1829, have recently secured a contract to supply the Chilian Government with 12 locomotives and tenders. They were obliged to compete twice with leading European and American concerns, bidding the lowest both times. A year ago this house bid on 450 freight cars twice and were the lowest bidders in each case, but the local press objected so strongly to sending such an order out of the country, when native shops needed encouragement, that finally it was kept there. While most of the South American countries have for some time preferred such goods should be built in the United States, it is worthy of note that the volume is constantly increasing and this particular order will not only amount to about $200,000 in American gold, but be the means of influencing a certain amount of contingent commerce. This rolling stock will be built by the Rogers Locomotive Works, Paterson, N. J.

San Francisco News.

The sales of wheat, flour, barley, fruit, &c., though at much lower prices than last year, have been so much larger than they were then that the prospect of business should be equally good. It has not been as good yet as it was then, but matters are improving, and business in hardware, iron, &c, has been much better than it was a little while ago. The value of the produce sold to date in a few of the leading articles has been equal to a round $9,000,000, and though that may not seem large to an Eastern business man it seems a good deal to the people in trade in this city, especially when it just represents the business done for the past three months only. These figures make no account of lumber, borax, wool, quicksilver or metals and minerals of various kinds, which would add very considerably to the total. There is an improvement, but a very light one, when compared with the falling off shown by the figures of the Clearing House, which vary all the way from 25 to 30 per cent. below those of a year ago. There is a fair demand springing up for builders' and farm hardware. Agricultural implements are selling in smaller quantity than they were a year ago. The demand for machinery is light, and as considerable of that has been supplied from the East the dullness of the times is felt by the agents of Eastern houses here. They try to put on a cheerful face before representatives of the press, but in private they will tell you that business was never duller.

The sales of nails are increasing somewhat. They have been dull and a big reduction was made some time ago, but that does not seem to improve the market. The "Commodore T. H. Allen," the "Florence" and the "Reuce" have come to hand recently with 6039 kegs. Receipts by rail for a long time have been very light. The jobbing rate for iron is $1.75 per keg, but it is said that the Nail Company have been selling as low as $1.65 per keg. This is a great difference compared to the old-time prices—about one-half. Prices have dropped rapidly this year. The Nail Company are talking of building again, but the cost would be very great and it is somewhat uncertain when they may start in. It is hard to get money and the price of nails is low. The consumption of California, Oregon and Washington is probably 600,000 kegs a year, worth at present prices about $1,000,000 a year. Now, with any sort of decent freight rates, all these nails could be supplied from this city. At present a little over one half of them is so supplied. They might all be, while the present factory could manufacture about one-half of them. We have, since the 1st of the year, received a few thousand kegs from Washington.

The pig iron business is duller than ever before. I have given you some figures as to consumption here. Now, since the first of the year the imports have slightly exceeded 8000 tons, of which 2000 tons have been from Great Britain. It will thus be seen that American iron now commands the market. It, however, sells very low, not to exceed $18 per ton. English and Scotch, when either is wanted, command about $4 more. The imports of scrap have fallen off almost altogether since the first of the year. This tells the story of the decline of business in our manufacturing establishments very eloquently.

There have been no imports of pig tin or tin plate for the past two weeks, but the market continues very dull in both. Tin plate is quotable at $5 50 to $5.60 for coke, and pig tin sells in small lots occasionally at 21¾ cents to 22 cents. Of course, the purchasing for the canning season has been much more extensive than was expected.

The Naval Architects.

The first general meeting of the Society of Naval Architects and Marine Engineers will take place in New York City at 10 a.m. Taursday, November 16, 1893, in the rooms of the American Society of Mechanical Engineers, 12 West Thirty-first street, the sessions extending through Thursday and Friday, November 16 and 17. The following is a preliminary list of papers to be read: "Transatlantic Navigation," Charles H. Cramp, president Wm. Cramp & Sons' Ship and Engine Building Company, Philadelphia, Pa.; "Steel Ships of the United States Navy," Theodore D. Wilson, ex-Chief Constructor, U. S. N.; "The Development of Shipbuilding on the Great Lakes," Jno. F. Pankhurst, vice-president and general manager Globe Iron Works, Cleveland, Ohio; "Notes on the Machinery of the New Vessels of the United States Navy" George W. Melville, Engineer-in-Chief, U. S. Navy; "Coal Bunkers and Coaling Ships," Albert P. Niblack, lieutenant, U S. Navy; "Production in the United States of Heavy Steel Engine, Gun and Armor Forgings," Russell W. Davenport, vice-president Bethlehem Iron Company, South Bethlehem, Pa.; "Determination of the Approximate Dimensions of a Vessel to Fulfill a Given Programme of Requirements," Joseph J. Woodward, naval constructor, U. S. Navy; "Comparative Performances of American and Foreign Freighting Ships—Our Superiority," Wm. W. Bates, late Commissioner of Navigation, Treasury Department; "The Wetted Surface of Ships," David W. Taylor, Naval Constructor, U. S. N.; "The Influence of Speed and Weight of Machinery on the Determination of the Other Elements of the Design of Steam Vessels," John J. O'Neill, Naval Architect and Marine Engineer; "United States Treasury Rules for the Inspection of Machinery and Boilers," Jas. T. Boyd, general manager George F. Blake Mfg. Company. Papers are also expected from the following gentlemen, but the exact titles have not yet been decided upon: Col. Edwin A. Stevens, president Hoboken ferries; A. Cass Canfield, member America's Cup Committee, New York Yacht Club; Joseph H. Linnard, naval constructor, U. S. N.

The recent depression in business has had a marked effect in decreasing the consumption of tobacco and beer, as shown in a material falling off in the internal revenue from those manufactures.

Intricate Drop Forgings.

Less than half a century ago necessity created a demand for "blacksmithing by machinery," or, as it is now commercially and generally termed "drop forging." The success of articles made by this process was first demonstrated in the production of firearms, sewing machines, &c., and in no small measure have they contributed to the enviable reputation of this country for superior machinery of all description. So rapidly has this industry grown and so widely have its products found acceptance that it would be a task of vast magnitude to even attempt to enumerate the several uses of drop forgings.

Any well equipped machine shop will be found capable of producing dies. To use these, however, for drop forging purposes without the genius embodied in the break-down impressions would be wholly impracticable. This factor has been especially prominent in the making of drop forging a distinct class of work, and to the successful application of the inherent principle of a smithy's art is almost wholly due that improvement which makes the adoption of drop forging almost universal.

As showing some of the difficulties encountered in drop forging we present drawings of some specimens of intricate work, and a description showing in more or less detail the exact methods pursued from the time the order is received in the office until the final product is shipped. It is through the courtesy of J. H. Williams & Co. of Richards and Bowne streets, Brooklyn, N. Y., that we are enabled to give our readers an account of the process carried along in their extensive establishment.

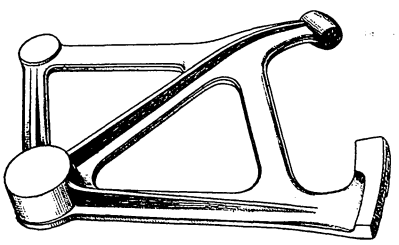

Fig. 1.—Shuttle Carrier.

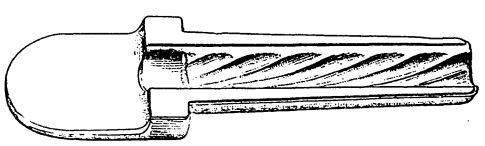

Fig. 9.—Wire Rope Clamp.

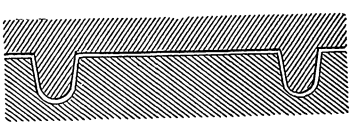

Fig. 7.—Section through Dies for Fig. 6.

INTRICATE DROP FORGINGS.

Contrary to the prevalent idea, the process of drop forging is the most expensive way of working metal, if but small quantities of forgings are desired. As the production of a single forging involves the entire cost of sinking dies and the making of all tools, each forging in the first product must necessarily bear its share of cost pro rata. This fact alone debars the absorption of the entire source of trade now supplied by castings and hand forgings, and as the art advances and the cost of production is reduced, that field, necessarily for its own good, must be further encroached upon. Therefore, drop forging should be classed as a work distinct and apart from that of steam or helve hammer forging, hydraulic press and hot-rolled work. Aside from the invaluable possibility of duplicating, the superiority of drop over hand forgings is due to the almost perfect homogeneity resulting from the continued pounding of a heavy hammer mechanically, yet wholly under the control of the drop hand.

First Work Necessary.

The order for a special forging may be accompanied by merely a verbal description and rough or scale drawing giving the dimensions, or a pattern more or less perfect. This forms the foundation and is handed from the office to the foreman of the die-sinking department. His first work consists in the making of sheet steel templets or gauges, which serve the die sinker as guides in his work and by means of which the final dies may be finished. After the dies have been sent to the hammer department these templets serve to tell when the dies have been worn out and when they should be either discarded or resunk, as, on account of the wear resulting from use, they have become worn beyond the standard allowance for that particular piece. Taking an ordinary lathe dog as an illustration, the sheet steel templets are nine in number, one giving the horizontal or flat outline of the dog, the others, when placed on the edges of the dies, outlining the several curves and their depths at different angles. In other words, considering the die as simply a block formed with irregular depressions, these templets serve to show when the die sinker has on any particular line reached the exact distance below the surface of the block, and also to inform him when he has obtained the exact degree of curvature.

It will be observed that the foreman in this case has no guide whatever, except his own experience and judgment. Of course, his object is to so make his templets that there may be no possibility of error on the part of the die sinker and that there may be no confusion in regard to his work as it progresses. This is essential, from the fact that in the die-sinking department all work is of the most expensive character, only the first outlining or roughing being done by machinery, the final fitting and bringing to the perfect outline being hand work by men receiving high wages.

Die Sinking.

The die-sinking department resembles, in a certain sense, a well-equipped tool room. We find lathes, drills, shapers and planers of common form. The two blocks forming the male and female dies are machined wherever possible in order to save subsequent hand work. We find here a special tool, known as the die sinking machine, resembling in its spindle and spindle driving gear the ordinary upright drill, but being provided with carriages, by

Hosted by Google

means of which the work held below the spindle can be placed at any desired angle and can be moved in any desired direction. The cutter, carried by the vertical spindle in precisely the same way as would a drill, is a milling cutter shaped according to the cut it is desired to make in the block. For instance, the female die for forming the curve in the bicycle frame connection, shown in Fig. 6, would be a round nose milling cutter, which would cut this curve to a depth and width sufficient to obviate in a great part any subsequent hand work. The universal movements of this machine and the rapidity of its operation and accuracy with which it can be manipulated, make it one of the most essential appliances in the department.

After having been machined as far as possible, the final work is done by hand by means of a hammer and cold chisel, the surface finally being brought to a fine finish with the aid of scrapers and rifflers, and in some cases, where the surface desired is unusually fine, the dies are polished with emery.

As is well known the dies consist of two blocks, male and female, which may or may not, according to the form of forging they are intended to make, be reversed duplicates of each other. In the laying out of the dies by the foreman, and in the making of his templets, he must first decide how he will cut the cavities in the dies in order that they may draw. This is precisely the same question that confronts the molder who receives a pattern. He must decide how he will mold it in order that the two parts of his mold may be separated and permit the withdrawal of the pattern. Two dies practically form a mold, which, under the operation of the hammer, is filled with the metal forming the forging, and it is therefore essential that upon the separation of the dies the withdrawal of the forging should be an easy task.

Lead Proving.

The dies having been finished are bolted together and lead poured in the impression in order to furnish a proof of the forging, which is submitted to the customer and by him altered or corrected as may be necessary. This is done as a safeguard and is practically forced upon the proprietors of the forge shop by reason of the fact that the orders they receive are not always perfectly explicit, and by submitting a proof they not only permit of alterations being made but also guard against final dispute.

Adjusting in Hammer.

Each die is formed with what is termed a shank on its surface opposite the face, this being provided in order that the dies may be attached respectively to the anvil and ram of the hammer. The shank is dovetailed, in order to fit in a corresponding opening in the hammer, and upon one side of the dovetail is inserted a wedge, which holds the block in position and also permits of its adjustment forward and backward. Sidewise adjustment is provided in the hammer itself. The guides carrying the ram can be moved so as to bring the upper die in any desired relation to the lower one. These two means of adjustment, front and back, and the right and left, are necessary, in order that the two dies may come together perfectly in line, and at the same time they permit of adjustment being made for wear in the hammer itself.

Tempering.

Some dies are tempered and some are not, according to the size of the die, the character of the forging it is expected to make and also the number of forgings called for. Where the edges are sharp and a great number of impressions are to be made steel of the highest quality is used, and it is tempered as hard as fire and water will make it. The first process in tempering is to heat the block evenly and thoroughly all the way through in an ordinary charcoal fire. It is then cooled entirely in water, after which it is again placed in the fire, warmed slightly to produce the desired color—usually a straw or copper—and cooled again in water.

This is one of the operations in which no guide can be followed and no rules formulated. The success of the operation depends solely upon the experience and judgment of the temperer, and when we state that the man who is now doing that work for the Williams Company has been before a forge fire for 53 years and over and is now doing all their tempering, the fact will be appreciated that his success is due in a large measure to long experience. The dies are now ready to go to the hammer.

Breaking-Down Dies.

The most difficult part of the whole business to learn, and at the same time the most essential branch, consists in designing the breaking-down dies. This is for the reason that not only the success of the work done by the forming dies is dependent upon the work produced by these dies, but also the cost of the whole operation, and especially the amount of waste material, which is a result in all drop forging processes, depends directly upon their correct form. This will be appreciated from the following: The shuttle carrier shown in Fig. 1 measures 6 inches horizontally and 5¼ inches vertically. It is formed from a steel bar 2 inches wide by ¼ inch thick. It is the work of the breaking-down dies to so distribute the metal of this bar that at the hub it will be collected or increased in thickness, that sufficient depth will be provided for the two right-hand ends, and that the metal will be formed up so that the finishing dies will have material enough in order to form the webs of the arms. The forming dies are approximate in shape to the finishing dies, but the edges are so arranged and curved as to force the metal in the desired direction. This specimen, Fig. 1, could be made directly by the finishing dies by providing metal of the desired thickness and width, but it is very evident that the work required of the dies would then be altogether too severe in character, and further than this, that the amount of metal wasted and going to the scrap heap would be out of all proportion. It is for this reason, and this reason alone, that the breaking-down

Fig. 10.—*Bicycle Fork Head.*

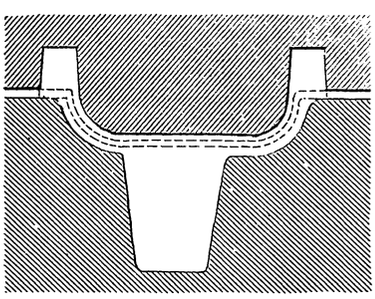

Fig. 11.—*Section through Dies for Fig.* 10.

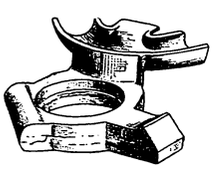

Fig. 13.—*Bicycle Crank-Bearing Connection.*

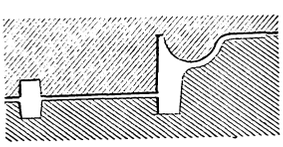

Fig. 14.—*Section through Dies for Fig.* 13.

INTRICATE DROP FORGINGS.

Hosted by Google

dies occupy such a prominent position in a drop-forging establishment. Sometimes in the case of small work the breaking-down dies and the finishing dies are cut on the same blocks. This is done mainly to save time, as at one heat the piece can be broken down to approximate shape and then passed to the finishing dies.

Trimming Dies.

Referring now to Fig. 1 and also Fig. 12, which are good examples of the part played by the trimming dies: As these two pieces leave the finishing dies the inner spaces and also around all the outer edges are filled with a thin web of metal caused by the surplus metal spreading out between the dies. It becomes necessary to remove this metal and the trimming dies are called into operation. They are constructed and they operate on the same principle as the common press. The punch corresponds in outline to the forging, which is forced through a die, the edges of which, in connection with the action of the punch, remove all the surplus metal in the openings and around the edges. The forging is then delivered or finished at the works, as the original order may call for.

Forge Shop.

In the forge shop we find a collection of drop hammers, ranging in capacity from 200 to 2000 pounds, trip and helve hammers and a steam hammer, the principal work of which is to aid the breaking-down dies and bring the piece as far as possible to a form approximating the form desired. Hard coal is used in all the furnaces, which are arranged down each side of the shop, and to which air is supplied by two blowers. There has also been recently introduced an upsetting machine intended for massing the metal on the end of bars, which otherwise would have to be made of stock the size of the head desired, and which would have to be hammered down in order to produce the smaller portion. This has been found extremely useful and has greatly aided and saved both time and expense.

Resinking Dies.

When dies have become so worn by long use—and we may state parenthetically that the life of a die varies from 300 to 20,000 forgings, according to the intricacy of the pattern—that the forging no longer comes up to the standard required, it becomes a question whether or not to discard the die completely or to re-sink it. If it is desired to re-sink it the temper is drawn and it is returned to the die-sinking department. Here the templets used in first construction are again brought into play and the face of the die planed off to the depth at which it has been decided to re-sink the pattern. The work from here on is in no way different from what was done in the first making of the die. Whenever possible a die is re-sunk for the simple reason that much preliminary work has already been done, and although it may have been worn considerably it still approaches very nearly to the exact form needed.

Quality of Steel.

Steel for dies varies from the softest steel obtainable to the highest quality of tool steel, this depending, as previously stated, solely upon the size and form of the forging desired. When there are many and sharp edges, and when the order calls for an unusual number, only steel of the finest quality is used. Steel is received in bars for the forging and in hammered blocks for the dies, and in the former case is piled in racks under suitable classification, in order that the shapes and quality may be easily kept track of.

Accuracy of Drop Forging.

It may seem strange to state that drop forging can be done so that it will gauge to within 0.001 inch. It will be evident that this could not be done with the metal hot, since it would not be possible for any hammer man to so heat his metal that there would not be a variation in size due to a difference in temperature. Therefore, when forging of this character is desired it is forged hot as closely as possible and then cooled and hammered cold to gauge.

Illustrations.

Our drawings were made from specimens selected at random, the endeavor being to show the intricacy of some of the work and at the same time to convey some idea of the range. Fig. 7 is an approximate cross section of Fig. 6, and shows the upper and lower dies and spaces between the two dies representing a cross section of the completed forging. The same is true in Figs. 3 and 4, 10 and 11, and 13 and 14. These are merely presented in order that an estimate may be formed of the character of the work done and how it is done, and particularly of the change which takes place in the shape of the metal in the dies.

Treatment of Forgings.

During the operation of forging the piece is brushed with a steel brush in order to remove the scale made by the hammer. If the piece, in order to complete it, is to be machined, the scale is pickled off in a weak sulphuric acid bath. When the pieces are to be case hardened they are placed in a muffle, packed with crushed bone and leather, and heated in a furnace. Forgings presenting sharp and well-defined edges are dumped from the furnace into oil, the planer and rounded shapes being immersed in water.

Keeping Track of Work.

In the foreman's office is a blank order book in which is entered each entry as it comes from the office, and which contains all instructions necessary. The items covered are as follows: Name of article, quantity required, material to be made of, size of material from which it is to be made, rack in which this material is found, anneal, pickle, number of dies, previous order, model, specimen, promised, shipped, net weight, lead proof or not. There is also space on each page for a record to be kept of the material taken from the stock room, and also of any surplus material returned to the stock room. Careful entries are made from time to time under the different heads of these orders, and at an instant's notice the exact condition of the work can be ascertained.

Regular Work Done.

J. H. Williams & Co.. in addition to a varied business in special forgings for outside parties, as is shown by an inspection of their die room, in which are some 2000 dies which they made and which are kept on hand in case they may be needed at some time in the future, do much forging for their own particular line of manufacture. They now make forgings from iron, steel, copper, bronze and aluminum, the latter working well under the hammer, but requiring extreme care in heating in the furnace, since, as is well known, it melts without giving to the eye any indication of heat. Among the regular work made by them are the well-known Brock chain pipe wrenches, single and double head engineers' wrenches, lathe dogs, thumb nut and thumb screw blanks, bicycle wrenches, and the like. Their special forgings have covered almost every line where it has been possible to introduce a forging in bicycle work, electrical appliances, pumps, railway appliances, sewing machines, typewriters, firearms, machinists' tools, &c. The quality of the work produced and the possibility of reducing the weight, and at the same time increasing the strength by means of drop steel forgings, have combined to constantly and quickly enlarge their field of operations. To appreciate this fact one must inspect, as shown in their office, their show boards, upon which are artistically arranged many of the specimens of work they have recently produced.

Wood Working Machinery at the Fair.

The display of wood working machinery at the World's Fair is a very fine one. The exhibits illustrate the great progress which has been made in this line of mechanical development during recent years. Many of the machines shown are triumphs of ingenuity. An interesting feature is also the remarkable manner in which difficult pieces of work are equally well accomplished by several radically different methods. The exhibits described are located in Machinery Hall.

The J. A. Fay & Egan Company

of Cincinnati, Ohio, have exhibits at Column F 38 and 41, which in completeness and size are characteristic of the company making them. A 42-inch triple drum floor sander shares the honors of attention from machinery men with a triple cylinder flooring machine and a timber planer for dressing stock as large as 16 x 20 inches on four sides. A band saw is exhibited which can saw stock 24 x 48 inches, also a hollow chisel mortiser ⅛ x 2½ inches. The entire display embraces 46 machines for use in planing mills, box and furniture factories, spoke and handle works, car shops, shipyards, &c. O. C. Wysong, in charge of the exhibit, says: "The latest thing on the market is the double end car tenoning machine, so constructed as to tenon long sills without having to turn the stock around, thereby saving time and space." On this machine, which cuts two tenons at once, instead of a carriage moving the main frame travels on planed ways by means of a screw which operates by friction. This may also be used as a cut off saw or gaining machine. Its weight is 10,000 pounds and it is highly approved by car builders. A new twin screw planer planes the stock on the sides 14 x 18 inches, is arranged to take the bottom cut first, and is provided with a hand wheel so that the bottom cut lower cylinder can be changed instantly without changing the size of the timber being dressed. It has eight feed rolls, all powerfully geared and making a positive feed, being raised and lowered by power. This machine has only recently been placed upon the market, but in that short time has met with pronounced favor. About 30 Reeves pulleys and

Hosted by Google

as many belts from the Page Belting Company's Works form a perfect net work in this exhibit around a booth used as an office and reception room in the center of the space. This booth is appropriately draped in red, white and blue.

The Hall & Brown Wood Working Machine Company

of St. Louis, Mo., have erected a booth of Georgia yellow pine within their area of 30 x 50 feet, at Column F 51. Here they exhibit to advantage 15 of their wood working machines, among which are included their band saw, 10-inch molder, No. 9 Hoo Hoo planer, one masher, two Mississippi matchers and an automatic double box cut off saw. The No. 9 Hoo Hoo, mentioned above, is adapted for almost any stock of heavy dimension for flooring and ceiling. Both the feed rolls are broken and two pieces may be fed at once from 8 x 12 to 1 x 1. The weight of this ponderous machine is 14,000 pounds; it is well constructed and free from complications. The stock goes to the top cylinder, 30 inches long, 5 inches cutting circle, and then passes to side heads, which edge the board, and it is then passed on to the lower cylinder, which planes the under side. This planer, which is in operation, is provided with feeding out wheels which carry the board through the machine. J. F. Judd, who has charge of the display, prides himself on having the only exhibit in this line which is piped for carrying away sawdust, shavings, &c.

Paul Pryibil

of New York City occupies about 900 square feet, at Column F 45, with his special machinery. From an overhead shafting some 45 pulleys and belts propel band and jig saws, planers, twist and fluting machines, corner block and rosette machinery, an edge molder, double and single borers, mortiser, drill for piano plates, piano action machine and a piano plate borer, which stands alone in its class. The last named machine has a double platform for carrying the piano plate, while overhead a suspended drill works upon it. A new parallel swing saw, which has only been on the market about six months, is doing good work and attracting considerable attention from the trade. An oval lathe for turning ovals is also deserving of more than passing mention and completes a very extensive exhibit.

Greenlee Bros. & Co.

of Chicago are located at Column F 48. Their exhibit covers in the neighborhood of 2000 square feet, being bounded by three aisles. A handsome oak booth in the shape of a pagoda has been constructed in the center, with maple flooring, and is occupied by Messrs. Gray and Carse, in charge of the exhibit, as an office and reception room. The line of high grade wood working machinery and special tools which this firm manufacture is so well known to the trade at large that a detailed description of all of them is superfluous. Probably the most attention is paid to their hollow chisel mortise machines, in which they make everything demanded from small sash work up to the large No. 7 car mortising machine, which mortises 2½ inches square, and carries on table, by power, timbers 70 feet in length. The double compound automatic machine shown has four hollow chisels operating on two door stiles at the same time by one operator, who clamps them to the table, thereby taking any wind out of them, and also feeding them to the stops, thus requiring no "laying out." This machine will blind mortise or mortise clear through two stiles at one operation. The advantage claimed for this over a chain mortising machine is that it will operate upon hardwood also, and the mortises are always square. Its remarkable points are its adjustments and high speed of gears revolving the bits, which make 5000 revolutions per minute, with no perceptible noise or wear. In addition, they also have a full line of self feeding saw tables, of which they are the inventors, embracing a No. 0 machine which rips 2-inch stock, and various other sizes up to a No. 12, capable of ripping 12-inch plank. Their latest improvement is an adjustable outfeeding device back of saw. They also have on exhibition a full line of anti-cut off machines, both single and double. The double machines are designed more for railroad work, it being possible to cross cut both ends of several pieces of flooring or siding by one operation at the same time. Here, too, are found two of their special sash, door and blind machines.

The Dubuque Specialty Machine Works

of Dubuque, Iowa, show their chain mortiser in operation at Column F 52. This machine is made in three sizes and is specially adapted for sash and door work, furniture factories and light stock work of all kinds. The three points which are claimed for it by the manufacturers are, accuracy, excellence of work and rapidity. It is simple and entirely automatic, the saw being fixed and the table bringing the stock to the tool along a vertical slide and dropping it again at the completion of the cut. The mortiser proper is composed of a chain of cutters riveted together, propelled by a sprocket and guided about a fixed bar with roller bearing at the point. A bright boy can operate it; it is easily kept in order, may be sharpened in three minutes and is adapted to all sizes from ¼ inch to 1 inch.

Charles L. Goehring

of Allegheny, Pa., has on exhibition at Column F 35 several of his immense machines for cutting geometrical moldings out of solid wood. There is a high speed molder of 16,000 pounds weight which requires no sand papering on the molding and produces perfectly smooth stock with a dead finish. The geometrical center piece circle machine tips the beam at 4500 pounds. It is excellent for oval, circular and geometrical figure of eight carving. A geometrical panel machine carves nine figures on door paneling at the same time. Completing the exhibit is the geometrical carver and molder, which operates as rapidly as straight work. The last named machine weighs 18,000 pounds. The Goehring geometrical molding machines are meeting with pronounced success in England and on the Continent of Europe.

The Fox Machine Company

of Grand Rapids, Mich., manufacturers of Universal mitering machines, show a full line of them at column J 43. The Universal trimmer is built in three sizes and five styles, including the latest improved trimmer, which cuts a back angle for a pattern maker, cutting any desired angle from 30° to 135°. These manufacturers build and show miter machines for belt and foot power, also cooping machines for factories. Included in their exhibit is a full line of dado saws or grooving heads, among them being a 62-inch machine, carrying five heads. A three-spindle boring machine, with tilt table, is likewise shown; also a 30-inch open side shaper and a 15-inch crank shaper. A planer chuck recently produced is on exhibition, together with corrugated sash pulleys, the latter wholly made of sheet steel by an ingenious process. Considerable attention is bestowed upon the quadruple bit for corrugated pulleys, making four holes at once, for the insertion of pulleys.

The Milwaukee Carving Company

of Milwaukee, Wis., show at Column G 44 one of the most interesting exhibits in their carving machine and samples of its work. It is particularly adapted for the furniture trade and interior decoration. The work is all done from a model, the machine consisting of four cutters connected in a yoke which follows a tracer, reproducing the model four times. The power is transmitted through a flexible shaft, the speed of each cutter being 15,000 revolutions per minute. It measures 7½ feet wide and weighs 2200 pounds, producing the heaviest work with large tools as well as the finest and most delicate work with smaller tools, varying in size down to a pin point. It will also cut one piece 40 inches, two pieces 20 inches and four pieces 10 inches in width, of any length and thickness up to 16 inches, finishing the work perfectly with the exception of sandpapering. Among other figures on exhibition are reproductions from a bust of Gladstone carved by the Seaman machine, of English manufacture; a head of Columbus in relief work which is very appropriate, and other ornamental and panel work, receiving much attention and many compliments.

The John A. White Company

of Dover, N. H., display at Column E 50 seven wood working machines, all in operation, in the 700 feet of space which their exhibit occupies. This collection includes the latest combination band resaw. They show one 54-inch resaw, one 26-inch Dover planer, one 16-inch planer, and a 24-inch Concord planer, besides lathes and circular saw tables. They further exhibit an improved method of power transmission, by which it is claimed that an irresistible force is derived from the edge of the belt. These goods were exhibited last year in Boston, where they received the gold medal. R. J. Butcher, road representative of the company, has the present exhibit in charge, and reports having sold one consignment of machines from the World's Fair samples to be shipped to Madras, India. A large photograph is prominently displayed of their works at Dover, N. H., which have been run full time during the prevailing depression in business.

The Art Embossing Machine Company

of Indianapolis, Ind., have in operation at Column F 33 one of their wood embossing machines. It is constructed of a bronze mandrel running on automatic friction rolls, with dies of any figure desired placed on the revolving mandrel and heated from within by gas, gasoline, &c. The stock is then passed through under pressure, receiving the design from the die above and at the same time taking color and smooth finish from the heat. The machine is provided with a pilot wheel for different thicknesses of stock and by a cam lever is thrown into or out of contact with

Hosted by Google

the die instantly. This machine is suitable for furniture work, moldings, car finish or any design on any wood desired, or produces an inlaid effect by bringing the hot die in contact with the surface, coloring the wood according to design.

The American Wood Decorating Machine Company

of New York City, by means of their wood embossing machine, shown at Column F 45, produce a very close imitation of hand carved work, so that few are able to detect the difference. The machine consists of a solid revolving die operated by friction. Work is done upon all kinds of hardwood, of which numerous fine samples are shown. This machine operates on any shaped piece of wood, working on circles, sweeps, insides and outsides equally well, executing all manner of figures and designs. They do not cater to heavy scroll work.

The Rohlmann Mfg. Co.

of St. Joseph, Mo., have their improved carving machine on exhibition at Column G 33, which carves four duplicate pieces at one operation up to 12 inches wide, or two duplicate pieces of any length up to 33 inches in width, or one piece as wide as 30 inches. The bits may be handled conveniently and in any direction within an angle of 30°, the top or table being raised or lowered to make thick or thin work and remaining the proper hight for the operator. The table rests upon sliding ways, so that it can be adjusted for the convenience of the workman on different varieties of work. An advantage claimed over other machines is its adaptability for different kinds of ornamental work without extra attachments, owing to the arrangement of cutters. These are so arranged that they may be carried in any direction, cutting under an angle of 30°. By a recently improved and original device all chips and dust accumulating are blown from the carvings, thereby assisting the operator. In chair patterns, panels, reliefs, statuettes, &c., the machine turns out remarkably fine work.

Goodell & Waters

of Philadelphia have an immense planer on exhibition at Column G 48 capable of planing four sides at one time. A "sticker" dresses, tongues and grooves the stock at one operation. Other machinery shown includes a band saw, one 12-inch jointer and countershafts.

Moore Carving Machine Company

of Minneapolis, Minn., have, at Column G 34, a handsome booth of ebony finish, 16 feet square, containing much of interest, on which visitors bestow a vast amount of admiration. The wood carving machine shown has four cutters, with an attachment of a pair of centers with tables for getting all degrees of undercuts. The model from which the machine works can be either hand carved, plaster of paris or papier mache. The figure on which the machine was working when a representative of this paper called last week was the well-known Venus, Goddess of Love, perhaps more familiarly known as the Lady on the Shell. This model is of plaster of paris, and four reproductions were made in four days, each valued at $75. One of the points commending this machine to manufacturers who use a carving machine is the width and thickness of stock which can be used and the work which can be done to advantage on the full length of any panel, either of hard or soft wood. This machine has only been on the market five years, but already there are nearly 100 working in Europe and five times that number in this country.

The Berlin Machine Works

of Beloit, Wis., have at Column F 42 one of the largest and most complete exhibits of wood working machinery. It occupies a space of 40 x 55 feet, which fronts on three different aisles and is inclosed by a neat iron railing. This exhibit may be divided into three departments, namely: Planing mill machinery, furniture trade machinery, including glue jointers and the Invincible sanders. The improved planer and matcher made by this company will work stock 6 x 15 inches. The cylinders make 4500 revolutions a minute, and a marked feature is the connection of rollers with self-oiling bearings instead of transmission by gears, thereby running rolls without vibration and having chip breakers on top and bottom cylinders. They also have the finest crucible steel arbors and all gearing inside of the frame, thus running cylinder pulleys close to cylinder boxes. The spindles measure $2\frac{3}{16}$ inches in diameter and the bearings 11 inches in length, with an improved cam locking device to lock the matcher spindles, avoiding variations. This size machine working stock 6 x 15 inches, weighs 11,000 pounds, which is 3000 more than the ordinary matcher of the same style. All parts are perfectly adjustable and interchangeable. The inside molder is of similar construction and possesses many of the same points of excellence. It is a 12-inch inside molder, having an extra bottom cylinder, and possessing all the advantages of an outside molder, throwing the heads horizontally, having the latest improved gearing. It is durably and scientifically constructed for accuracy and rapidity, being aptly termed the planing mill man's friend. The Beloit manufacturers also display a single cabinet surfacer with sectional broken rolls, all the rolls being weighted with improved fast and slow feeding device, neither a friction nor clutch, but a simple and accurate operation. A description of their machinery would indeed be incomplete without reference to the Invincible sander, which for the past 15 years has sustained an enviable reputation for producing a high level parallel finish. By the triple drum a positive and accurate oscillation of the steel cylinder is secured. One of their Junior Sanders is also included in the exhibit. The glue jointer shown was only introduced a year ago. Other machinery shown includes a self feeding rip saw, double shaper and a buzz planer or hand jointer. The display is in charge of the company's genial salesman, Mr. Kelly.

E. & B. Holmes

of Buffalo, N. Y., exhibit at Column F 50, Machinery Hall, a variety of wood working machines, including machinery for the production of barrels and kegs. Prominent in this display is the King timber planer and sizer, claimed to be the largest exhibited at the fair. It will work pieces 26 inches wide and 16 inches thick, and planes all four sides. Another notable machine is the Niagara endless bed double surfacer with feeding out rolls, built to work 26 and 30 inches wide and 12 inches thick. In addition are shown the Erie fast feed flooring machine, an improved circular resaw, an improved gang edger with straightening attachment, an improved spur feed rip saw hand siding machine, an improved balancing scale for planer knives, a new automatic knife grinder, &c., comprising in all 15 patterns of high class machinery. An important feature of the exhibit is a variable feeding device which can be applied to all planers and matchers and is regarded as a most valuable improvement in the operation of wood working machinery. The manufacturers state that it thoroughly regulates the speed of the machine, so that the operator can adjust it to a nicety, whether the material be wide or narrow, or the cut heavy or light, and whether the wood be hard or soft. It can be changed instantly without stopping the machine or the motion of the material, and it is claimed that by its use one-third can be added to the output of the machine. The keg machinery shown is in extensive use among makers of nail kegs. Edwin Bell's Sons & Co., very large manufacturers of nail kegs, whose operations are conducted at various nail making centers, have recently made heavy purchases of the machinery manufactured by the Messrs. Holmes. The exhibit is in charge of E. B. Holmes and A. E. Lambert.

H. B. Smith Machine Company

of Smithville, Burlington County, N. J., make a very large exhibit of their machines at Column F 46, Machinery Hall. The display includes a planer and matcher, a new six-roll double surface planer working up to 26 inches in width and 16 inches thick, a cabinet surface planer, a new single surface planer, a new hand planer or jointer, new 10, 9, 8, 7 and 6 inch molding machines, an improved double spindle irregular shaping machine, a single spindle reversible shaping machine, an improved panel raising machine, a blind rabbeting, beading and jointing machine, a double end tenoning machine with double cut off saws in front, a double end tenoning machine with double cut off saws in the rear, a new single tenoning machine, a new self feed blind slat tenoning machine, a power mortiser with boring attachment and clamp table and rack and pinion feed, foot power mortiser, band saws, resaws, sawing tables, relishing machine with attachment for dovetailing sash, a three-spindle boring machine, geometrical carving machine, miter cutting machines, lathes, &c. The special features shown in connection with many of these machines would require unlimited space for their enumeration. An example is the new carriage devised for No. 2 tenoning machine. This is now mounted on rollers instead of slides, greatly decreasing the friction and adding much to the ease of operating the machine. The geometrical carver is a machine of simple design, easily operated, but capable of a great variety of work in carving corner blocks, rosettes, &c. The designs of which it is capable are almost innumerable. The company also have on exhibition the Haines patent blind slat tenoning machine, which operates two slats at once, the slats being revolved by power, thus increasing the output at least 50 per cent. The display is in charge of Wm. S. Kelly.

The S. A. Woods Machine Company

of Boston, Mass., exhibit 15 machines at Column F 35, Machinery Hall. In such an exhibit as the Woods Company have made it is difficult to determine which is the most deserving of mention. Perhaps their new double surfacer and sizer attracts as much at-

Hosted by Google

tention as any one machine shown. It is intended for planing all kinds of bill timber perfectly square, beading heavy girders and a variety of mill work. By use of a center guide two pieces may be dressed simultaneously on three sides each. By use of a power hoist the machine is quickly changed while running so that timber of various sizes can be planed without sorting, or two pieces of unequal thickness run through at the same time. Another machine deserving the many good things said of it is the 24-inch single shop surfacer, especially adapted where a strong feed and fine finish are necessary. The bed moves up or down on gibbed ways located to obtain great steadiness, and the elevating screws are of large diameter, aiding to keep the bed firm and steady. The new automatic knife grinder with power feed for wet or dry grinding is a very superior machine, having an absolutely straight and true edge. The machine is very compact, solid upon the floor and no jar is experienced in running. Other machines on exhibition are their automatic floor board boring machine, 38-inch band saw machine, a heavy pattern self feed saw table, double iron adjustable saw table, circular resawing machine, improved jointing and facing machine, new cabinet surface planer, and their four-roll molding machine.

J. Hallawell

of North Mernon, Ind., has on exhibition at Column I 35 one of the hub boring machines which he manufactures. These machines bore from both sides at the same time, and have a capacity of 3000 planks per day. One pair of augers will bore 1,000,000 blocks, and they may be resharpened in three minutes. A prominent feature of the display is a pyramid of blocks in one corner of the space.

The American Well Works of Aurora, Ill., have secured a medal for their revolving process machine, by which wells are sunk by the revolving of the tubing and a stream of water washes out the borings. The deepest and largest wells sunk in alluvial formations, quicksand, &c., have been sunk with it. J. W. Byrnes & Co. have sunk a well with it at Galveston, Texas. It was commenced with 22-inch bore, and is sunk to a depth of 3067 feet in quicksand and clay, with alternate strata of hard materials.

The Verein zur Befoerderung des Gewerbfleisses of Berlin has awarded to Professor Ledebur the prize for an essay on the reliability of current methods for the estimation of carbon in iron and steel. The memoir is printed in full in the last issue of the Transactions. Professor Ledebur prefers the Saernstroem methods.

Judging from the number of meetings being held and their stormy character, the representative members of the Finishers' Association of the Youngstown district would rival our national legislators as prize talkers over a vague subject.

The Berlin Iron Bridge Company of East Berlin, Conn., have received the contract for the new draw bridge at Salem, Mass. The bridge will have a 60 feet opening with a roadway 28 feet wide in the clear, and two sidewalks each 6 feet wide. It will be a deck plate girder construction.

THE WEEK.

To encourage the mining industry of Chile the Government of that Republic has, as previously mentioned in these columns, decided to hold a mining and metallurgical exposition at Santiago, opening on March 15, 1894. Foreign manufacturers have been invited to exhibit machinery and tools and other apparatus connected with mining, the suggestion being made that only models or drawings of heavy machinery, motors and boilers be sent. The space needed will be given to exhibitors who apply for it before January 1, 1894, and motive power will be supplied. The freight on exhibits from Europe or the United States will also, it is understood, be paid by the Chilian Government. The exposition will close on April 30, 1894.

A combination of all the street railways of San Francisco is announced, with a capital stock of over $18,000,000, the greater portion of which is understood to be owned by the Southern Pacific Company.

Professor Bland of Vermont University is making experiments with the view of converting culm into a fertilizer.

The substitution of electricity for cable power is being considered for the Brooklyn Bridge railroad.

The great coal strike in England, which began on July 28, is practically over, a large majority of the strking miners having resumed work.

Co-operation has, says the *Mining and Scientific Press* of San Francisco, Cal., been successfully adopted as the method for starting several of the idle mines at Leadville, Col. The Maid of Erin has set the example, and others are expected to follow. The plan whereby the resumption took place was an agreement between the men and the management to deduct the expenses of operating from the gross receipts and divide the net profits on a percentage mutually satisfactory. Between 50 and 100 men went to work on the first day, and should the scheme prove successful the force will be largely increased, and many idle men thus be employed.

Representative Caminetti of California has introduced in the House a bill to provide for the establishment of a gun factory for the finishing and assembling of heavy ordnance at Benicia, Cal., at the cost of $1,000,000.

Ground was broken on October 12 for the new Bourse Building in Philadelphia. The work will, it is said, be vigorously pushed, and the building is expected to be well under way by spring.

Canada's mercantile fleet on the registry books last year numbered 7007, with a tonnage of 964,129, a decrease in the year of 84,364 tons.

A notable exodus of Hungarians from Pennsylvania has occurred during the past two months. At least 7000 laborers of that nationality are reported as having left the State, owing to the poor labor market. Most of them have returned to their own country.

The Hamburg American Packet Company have made contracts for the construction of five large twin-screw steamers for Transatlantic service. Three of the new steamers will be built at Belfast, and the other two at Stettin and Hamburg respectively. They will each be of 7800 tons and 465 feet in length, and will have a very large freight capacity. When these five steamers are completed, the Hamburg-American line will own the second largest tonnage in the world, being less than that of the Peninsular and Oriental Company only.

Recent troubles in Central and South American republics have caused an active drain on our naval resources for war vessels for the protection of United States interests in the disturbed quarters.

One outcome of the recent financial stringency in New York City is noted in an almost complete cessation of speculative building during the past few months. Real estate journals regard this as a not unmixed evil, as the demand for houses is said to be rapidly catching up to the supply, causing greater steadiness in the market. The concomitant lack of employment is, however, pressing hardly on workmen in the building trades.

Incoming vessels report an unusual crop of derelicts in the Atlantic, many of which are in the direct path of the ocean liners. Twenty of these obstructions were recently reported to the Hydrographic Department in various positions off the coast from Maine to Florida, and the dynamite cruiser "Vesuvius" was sent last week on a mission of destruction toward those floating off the Jersey shore. It is probable that another naval vessel will be detailed to remove the derelicts since located, the number of which is said to have been augmented by last Friday's storm.

It is said that Secretary Herbert does not think that the Holland submarine boat, selected by the expert board, fulfills all the requirements sufficiently fully to justify him in expending $150,000 in constructing and experimenting with a boat of this type. The Secretary believes it will be better to wait awhile before building a submarine vessel, so that time may be allowed for the development of a thoroughly trustworthy one.

Immigration statistics for the port of New York for the month of September show a decided falling off in the number of immigrants, particularly from Italy and Poland. The number of alien steerage passengers landed was 21,797.

The contract for building the much talked of Syrian railroad from Haifa to Damascus has been awarded to a Chicago firm, Huss & Townsend. Work is to be begun immediately. The enterprise has been initiated by English capitalists, who purpose ultimately extending the road to India if Persian concessions can be obtained.

After exhaustive experiments in New York harbor with the torpedo boat "Cushing" to determine the best color to paint such boats in order to escape detection by search lights, it was found that a dull green hue rendered the boat almost indisguishable from the water. A recommendation is to be made to the Navy Department that all torpedo boats should be of this color.

The situation of the unemployed miners on the Gogebic range is reported by Western papers to be becoming serious. Bread riots have already occurred in several towns, and further disturbances are feared. Efforts are meanwhile being made to relieve the distress by raising money to feed the men and their families, as no present prospect of employment can be be held out to them.

Disposition of Machinery Exhibits.

Considerable interest is manifested in the probable disposition of machinery exhibits at the close of the World's Fair. Some of this is due to the effort recently made by a prominent machinery house to sell at auction a large stock of machine tools, including those in their exhibit at the fair. It is evidently thought that this may be an example which will be followed by others. Those who are looking for bargains in the machinery line are presumably hoping that this will be the case. The auction sale alluded to, however, was not a success. The number of machines disposed of fell far short of expectations, while the prices realized fell still shorter. It is stated that few of them brought two-thirds of the very lowest discount previously allowed, while some sold down to, if not below, half price. Such results are rather discouraging to the growth of auction sales in the machinery trade. Had the one just tried proved fairly successful, others, perhaps, might have followed. It is now likely that no one will care to venture a repetition of the experiment. Careful inquiry fails to disclose any prospect of such sales taking place among the exhibitors of machinery at the fair. It is true that one manufacturer of wood working machinery is offering his machines, according to conspicuously posted signs, at an "enormous discount," but not even his example is being followed, so far as can be ascertained.

Many exhibitors state that they have sold duplicates of machines exhibited, and that they may at the close of the fair decide to ship direct to such purchasers from the exhibit. But this cannot be so satisfactorily done at the fair as at the home shops, because it may be necessary to pack certain parts much more carefully than would be done for merely shipping from the fair to the shops. This is especially the case with sales for export, which have latterly become quite a feature in the machinery section. There are some portions of machines destined for such shipment that will be carefully soldered in tin packages to insure their receipt in good order, free from rust or other deterioration. Makers of ponderous machinery, and perhaps others, are willing to take reasonable reductions on regular prices, which would offset the expense of shipment back to the shops, but there is little apparent disposition to make any sacrifice in the value of standard machines merely to get rid of them. Exhibitors who have had previous experience at large fairs say that those who try the experiment of storing machinery in Chicago in the hope of selling it in the course of time will find that they have made a blunder. In much better times than these machines have been stored in the hope of an early sale, but disappointment followed in the majority of cases. Concerns having regular warehouses in Chicago, with agents to carefully look after their special interests, are of course in a position to pursue a different policy. Their machines will be transferred to the Chicago warehouses as a matter of regular business.

A number of exhibitors interviewed appear to be in no hurry to make any definite arrangements for the disposal of their machines, but will let circumstances govern them. Such machines as can easily be removed to the shops will be shipped as soon as convenient after the fair closes. Those of which there is some reasonable hope that they may be sold will be permitted to stand for a time. As the buildings will not be torn down this winter, such machines can be "doped" and will then pass through the winter without injury, and can be removed in the spring when the rush of shipping exhibits will be over. The transportation facilities, however, are vastly superior to what they were last winter and spring when installations were made, and those who are in a hurry to get their exhibits back to their shops will not experience much delay or inconvenience on that account.

Professor Reuleaux's Chicago Speech.

A casual utterance of *The Iron Age*, innocent in intent, and growing out of a misapprehension, has created a great hubbub on the other side of the Atlantic. It has, we regret to state, done great injury to one whom Americans justly honor, and who has in the past done signal service by timely and frank criticism to the manufacturing and art industry of his own country. At the meeting of the World's Engineering Congress Professor Reuleaux was called upon, unexpectedly to him, to address his fellow engineers. One sentence in this extemporaneous speech was misinterpreted by us as implying an acknowledgment by him that American workmen had attained greater precision as mechanics than their German fellows. In justice to Professor Reuleaux we print below the full text of that part of his remarks dealing with the subject, from the stenographer's official record:

Should I be allowed to mention some points on the mechanical exposition, to which my own profession goes directly, I should say that I was astonished on one point in the most striking way. It was the development of exact measuring. That precise measure method has been developed through America in such an astonishing way that we are always struck by it. Your workmen are already accustomed to measure by the thousanth of an inch, we have begun only to do so. In the United States you will find instruments in nearly every hardware shop for such measurements, and especially on the part of scientific engineering; this is giving you, and will further on give you, a great advantage over all others who do not work so. I dare say we have begun in Germany and in France and England to follow you, but we are the followers and you are the leaders until now. So I could find a great many points in the mechanical exhibition of this exposition which are in advance, and so I see the Americans now going on to lead the progress of mechanical engineering, and I have been thankful to have been able to see them, and to be able to congratulate American friends and engineers.

From a more detailed elaboration of Professor Reuleaux's position which he then desired to present to his audience, and to which he still adheres, we understand it now to be this: In this country the system of depending upon precise measuring as the fundamental basis of manufacturing operations in certain lines of work has developed rapidly, and while Europeans are following, further progress in that direction is still being made in this country, keeping us in the van. As an illustration of how widespread that system is Professor Reuleaux instanced the fact that the necessary instruments are in the hands of every mechanic. He dealt with the system, he did not mean to draw any comparisons between the ability of mechanics of different countries to employ tools for fine measurement.

We believe that in the light of this statement Professor Reuleaux will be pronounced innocent of any effort to disparage the abilities of the workmen of his own country. We must confess that the violent outburst of patriotic indignation which the German press has indulged in is somewhat incomprehensible to us. We trust that those who were so eager to assail Professor Reuleux will be animated by the same fair spirit of seeing justice done which has made us anxious to acknowledge that we misunderstood his remarks and drew from them inferences which we now know were far from his thoughts.

The Iron and Steel Institute Meeting.

On the whole, the expectations raised by the announcement of the proceedings of the Darlington meeting of the Iron and Steel Institute have not been realized. The first paper read was that of the famous Austrian metallurgist, Paul Kupelweiser, which was not put before the Institute at its last gathering. We commented on it at the time, regarding it as one of the most important contributions of recent years. It is possible that the Witkowitz duplex process has not that interest for English metallurgists which it possesses particularly for those who are striving and hoping to establish a steel industry in our Southern States. The works which Paul Kupelweiser conducted until recently are the only establishment in which pig iron is taken direct from the blast furnace to Bessemer converters, where

Hosted by Google

it is desiliconized and is then poured into a basic open hearth furnace. Since that has been the favorite method proposed by Southern metallurgists, the success at Witkowitz has been very encouraging. The remarks and criticisms of James Riley of the Steel Company of Scotland in the discussion of the paper were evidently from the narrower standpoint of availability of the duplex process for conditions prevailing in England. We are inclined to believe that from a commercial point of view Mr. Riley's position is correct. The technical results, however, seem to us to have been belittled in vain. The achievements at Witkowitz prove that the duplex process can be carried through successfully. It remains to be seen, of course, whether commercially the South can meet the competition of soft steel produced from lake ores at points west of the Alleghenies or made in the Eastern territory from local and foreign raw material.

Sir Lowthian Bell has contributed a paper on "The Waste of Heat (Past, Present and Future) in Smelting Ores of Iron," in which he develops an interesting analysis of the heat balance sheet, if it may be so termed, of the blast furnace. Sir Lowthian Bell does not appear to hope for much gain in the direction of higher blast temperatures, or the better utilization of the heat in the gases in the hot blast stoves or under the boilers. He has turned to the employment of the sensible heat in the cinder produced and that in the exhaust steam from the engines. He has experimented without accumulating any large array of data thus far, with turning the exhaust steam into chambers in which the cinder is allowed to cool and then availing himself of the heated steam thus obtained to evaporate brine.

Professor Ledebur's paper on "The Modifications of Carbon in Iron" is a good summary of the present status of research into that somewhat abstruse subject in which developments may soon attain a point where their practical utility to the producer and the consumer of steel become apparent.

We confess to some disappointment at the paper presented by J. P. Bedson, on "Iron and Steel Wire and the Development of its Manufacture." It is very largely historical and does not refer to the very latest work done. It is only fair to state, however, that Mr. Bedson promises to give some data later on concerning the new works which he is building for the Bedson Wire Company, at Middlesborough.

To rolling mill managers in America the most interesting but at the same time puzzling paper is that of William Muirhead on "Suggested Improvements in the Manufacture of Steel Plates." Mr. Muirhead was encouraged by his success in rolling angles, bulbs and bars, to propose a similar method for plates. So far as we can understand the plan without the drawings which accompany the paper, Mr. Muirhead does his blooming on one train driven by a direct coupled high speed engine and finishes without reheating on a second train. This is what he intends to adopt also for plate rolling, the main object being to get rid of the reheating of the slab.

The Closing Month of the Fair.

The World's Fair is winding up its career in a blaze of glory. As Chicago suprised the world with the grandeur of its exposition buildings, and as the magnificence of the display in its entirety far surpassed anything previously accomplished in the same line, so has the attendance outrun all expectations, and in that respect another phenomenal triumph has been scored. High water mark was struck on the 9th inst., "Chicago Day," when the total attendance reached 761,942 including those admitted on passes, or 716,881 paid admissions. Several days in the same week the paid attandance ran above 250,000 and on two days it was over 300,000. The total paid attendance for the week, including Sunday, the 8th, was 2,131,719. This far outnumbers the attendance in any similar period at any previous international or any other kind of exposition, or, in fact, any other kind of gathering of which there is any authentic record. A figure is thus set for the future that will be very difficult to exceed, and it is safe to say that for years to come any very great gathering of people will be compared with this stupendous occurrence in Chicago on the 9th of October, 1893. The attendance at the exposition for the week is another most notable matter. The figures are staggering. But Chicago boasts not alone of this achievement in attendance. To the surprise of many shrewd business men, who had not looked for such success, the exposition managers signalized Chicago Day by paying off the floating debt and the mortgage on the gate receipts, thus leaving the enterprise free of all obligations to any persons but the stockholders, who may now reasonably expect a dividend in due season. The check drawn on this memorable occasion for the payment of the trustee of the several classes of creditors called for $1,565,310.76. Thus has Chicago gloriously redeemed the obligations incurred when she assumed the task of building a World's Fair. Chicago's business men started out to prepare for a finer, bigger and more successful enterprise than the world had ever seen in this line. The verdict of the jury of the nations of the earth who have seen it is that it is unquestionably bigger and undoubtedly finer, and now it is assuredly more successful. Great is Chicago, and we are prouder than ever of her.

Among those who will lecture before the Franklin Institute of Philadelphia during the coming season will be Henry R. Towne of Stamford, Conn., who will speak, on January 26, on "American Bank Locks and Fastenings."

CORRESPONDENCE.

Foreign Labor Pests.

To the Editor: The Riverside Iron Works of Wheeling, W. Va., have set an example in dealing with obnoxious foreign laborers which many managers and superintendents will hope that their companies will soon be able to follow. They have summarily discharged from their employment all Italians, Poles and other common laborers who represent Europe's worst element, and hereafter will employ only good citizens. This action was the result of riot and disturbance in which these labor pests indulged a few weeks ago; and it will cause exultation among all who have ever had dealings with this class of workmen. Following the action of the Riverside Company, blast furnace proprietors, rolling mill operators, the Pittsburgh & Lake Erie Railroad Company, and other employees of common labor at New Castle, Pa., have taken a decided stand against the employment of such labor, and there has been a general exodus of undesirable foreigners to their native shores or to other parts of the United States where they are still tolerated.

Only those who have had laborers of this class under their charge can fully realize how difficult it is to deal with them. They are capable of exasperating any one with whom they come in contact. When seeking employment they are submissive and servile, but after they have secured it their dumb insolence is unbearable. They are cunning as foxes, and will never understand except when it suits their convenience, and their vocabulary of English is never used except when there is an imaginary or real shortage in their pay or they think that an opportune time has arrived to raise a disturbance. If furnaces, mills or coke ovens are shut down and they are temporarily thrown out of employment, they do not spend any part of their savings, but live by committing depredations among farmers and others. They will shirk their work and do only the bidding of a taskmaster who speaks their language and is too often the recipient of a commission from their wages. Their appreciation of a labor situation is keen, and troubles among them always rise like a volcano. In the language of one of their number who tries to hide his disgust under cover of a plea of extenuation for his more ignorant brethren, "If each Italian would try to become a good, naturalized citizen the prejudice against them would die out." It is doubtful, however, if this would make the average Italian or Polish laborer tolerable. They are a source of continual annoyance, always getting into lawsuits, fighting among themselves and a constant menace to peace wherever they are gathered in numbers. Taken altogether, they have not a redeeming trait, as a body, no matter what virtues individuals may possess, and the employer who lends his assistance toward ridding the labor world of this disturbing element will be entitled to the thanks of all concerned, and will afford opportunities for securing employment to good, honest, peaceable workmen, whose citizenship will be a credit to the country. B. D.

Prof. Sylvanus Thompson of London believes that ocean telephony is not only possible, but that it will be among the developments of the near future.

Lake Superior Mines.

Along the Lake Superior mining district has there been not even the semblance of increasing activity that the daily press has given the iron workers' trade. The situation has steadily gone from bad to worse ever since the general shut down in July. Even the phenomenal activity in shipping from the Mesaba is a sign of quiet for the older ranges not only for this fall, but the early part of next year at least, for most of the Mesaba ore now going forward in such quantity is unsold and will lie on Cleveland and Lake Erie docks until such time as there is a better demand. The startlingly large decrease of furnace work does not augur well for activity for the ore trade for a long time to come.

By ranges the situation is about as follows: On the Menominee and Marquette ranges, where 57 mines produced ore last year, only about a dozen are at work, and those not actively or extensively. Less than 1000 men are at work on the Menominee, where a year ago there were 3000 or more. In the Crystal Falls section of the Menominee not a single mine or prospect is busy. The Chapin Mine, which had achieved a production up to last fall third in rank in the entire country, has lifted its pumps and abandoned operations for the present at least. Three of the large mines of the Marquette range have lately been added to the same list of flooded properties. Ore shipments for the year from both these ranges are about over.

On the Gogebic range only enough ore will now be sent to shipping ports to load vessels now on the way or under charter. A year ago 15 mines were shipping to Ashland and the week's forwarding was 75,380 tons. This week only one mine is shipping and the weekly report is scarcely worth mention. Last week the total shipped was 17,459 tons. A year ago Ashland shipments had been 1,966,000 tons for the season. To date this year they have been 1,015,000 tons. Total Gogebic range shipments to the lower lakes last year were 2,974,000 tons. This year they will not equal half that. Several of the better mines here also are filled with water.

On the Vermillion range, at the Minnesota Iron Company's mines, where 2500 or more men are employed in prosperous times, there are only half a dozen underground carpenters, and less than 200 on the surface, stock pile men. It is generally believed that even this trifling force will be idle November 1. At the Chandler there are none but stock pile men, and only a score or two of them. The Pioneer is idle and is flooded. The Zenith has shipped its stock pile and stopped all operations. There are no other productive mines on the range.

On the Mesaba the Biwabik, Oliver, Commodore, Franklin and Mountain Iron are working. Were it not for the cheapest mining and the money of a very heavy syndicate furnished to allow ore to be held on Lake Erie docks and the desire to get as much of the new ore as possible to furnaces, several of these would be idle. The Commodore will shut down in a few days. The range will ship about 500,000 tons for the season, not nearly as much as was expected last season, but certainly a good total for a new district.

That there isn't much consolation in this review of the situation goes without saying.

The Mesaba has made some steam shovel mining records the last week that are interesting and exceedingly important as showing what the range can do. At the Biwabik are shoveled, mined and loaded on cars, 85 cars, or 1950 tons, in nine hours. This is at the continuous rate of nearly 4 tons per minute for the entire time. Other records made in the past two weeks have been, at the Oliver, 1500 tons in seven hours; at the Mountain Iron, 1700 in nine hours; at the Biwabik, 3400 in 20 hours. It is expected that the Hale will resume shipping in a short time. Very extensive operations will be carried on by the Biwabik, Commodore, Franklin and by several of the consolidated mines during the winter, among the latter particularly at the Rathbun and Adams, which will each be stripped for steam shovel mining.

The total ore shipments from Lake Superior, including all the mines in the region except those shipping via Escanaba, on Lake Michigan, up to and including October 12, were 4,100,000 tons. Escanaba shipments have probably not been to exceed 1,000,000 tons more. For the entire year there may be sent forward from the mines as high as 5,500,000 tons, against a total of 9,074,000 tons in 1892 and an average of over 8,000,000 tons for the past four years.

OBITUARY.

DENNIS LONG.

Dennis Long, founder of the well-known pipe making firm of Dennis Long & Co. of Louisville, Ky., died at his residence in that city on the 8th inst., after a short sickness. Mr. Long was born in Londonderry, Ireland, in 1816. At the age of four years he came to America with his parents, the family settling at Erie, Pa. A few years later they moved to Pittsburgh, where Mr. Long served his apprenticeship as a molder. His first journey work was performed in Louisville, to which place he went over 50 years ago. Of an industrious and saving turn of mind, he soon saved enough money to start a foundry and machine shop of his own. His principal business at first was done with the steamboats on the Ohio river, the river traffic at that time being one of the chief revenues of business of Louisville. The first pipes for the St. Louis, Mo., gas works and the first large water pipes for the city of Nashville were made by Mr. Long. About this time Bryan Roach became associated with Mr. Long, and the firm enlarged their capacity under the firm name of Roach & Long. In 1860 Mr. Roach died, and the business from that time on was conducted by Mr. Long, the corporation of Dennis Long & Co. being formed later on. He also built and run for a number of years pipe works in Columbus, Ohio, and Chicago. Mr. Long was particularly unfortunate in suffering loss from fire on four different occasions, one of the occasions being the burning of the large pipe works, entailing a loss of $300,000. Some years ago the holding of a large amount of the then unsalable water company bonds of a distant company compelled Mr. Long to call his creditors together. He exhibited the state of his affairs to his creditors, who decided to act in accordance with any plan Mr. Long might himself suggest. He asked for an extension of time and gave his notes with interest at 6 per cent. Every note was faithfully paid in three years' time and many of the notes were paid before maturing. At the time of his death Mr. Long was president of the corporation of Dennis Long & Co., president of the Louisville & Jeffersonville Bridge Company, and director in several companies and of various institutions. He leaves an estate valued at $1,000,000.

BENJAMIN WHITWORTH.

English journals announce the death, on September 24, at his residence, Hampstead, near London, of Benjamin Whitworth, one of the foremost men in the coal and iron trade of England. Mr. Whitworth was born at Manchester in 1816, and as a young man joined with his brothers in the business of fustian manufacture. Subsequently he became connected with the coal and iron industries, and was one of the originators and first directors of the following well-known corporations: Bolckow, Vaughan & Co., Tredegar Coal & Iron Company, John Brown & Co. of Sheffield, Staveley Coal & Iron Company and Sheepbridge Coal & Iron Company. Mr. Whitworth was a man of wide sympathies and engaged in many philanthropic works, besides being a liberal giver of halls, libraries, water works and other useful public institutions to towns with which he was connected. He sat in the British Parliament as a Liberal for a number of years.

THOMAS HAWKESLEY, F.R.S.

Thomas Hawkesley, F.R.S., one of the best known civil engineers of the day, and a prominent member of the British Iron and Steel Institute, died in England, on September 23, at the age of 86, having retained his mental powers and his large professional practice to the last. Mr. Hawkesley stood for a long period at the head of his profession as an expert in that branch of it which relates to water and gas supply and to drainage and hydrants, having constructed over 150 water works all over the world, many of them of the largest character.

VALENTINE W. WEAVER.

Valentine W. Weaver, superintendent of the Macungie Furnace of the Crane Iron Company at Macungie, Pa., dropped dead at Catasauqua, October 11, of apoplexy. Deceased was born in Northampton County, Pa., in 1826. At the age of 20 he became an apprentice at the Crane Iron Works, Catasauqua, where he learned the trade of machinist. After several years he became assistant superintendent of the Thomas Iron Company, Hokendauqua, for whom he erected and managed the Lock Ridge Furnaces, at Alburtis. He also superintended the erection of the Macungie Furnace. In 1879 Mr. Weaver moved to Coplay, Pa., as superintendent of the Coplay Iron Company's works, where he remained several years. Later he removed to Macungie and assumed the superintendency of the Macungie Furnace. Mr. Weaver was a director in the Catasauqua Mfg. Company, a stockholder of the Thomas Iron Company and a director in the Catasauqua and Slatington banks.

DANIEL WOLF.

Daniel Wolf, of the well-known firm of Hillebrand & Wolf, proprietors of the Star Lock Works, Philadelphia, died on Friday evening, September 29. Mr. Wolf was born in Rhenish Bavaria, and came to this country in 1846, and in 1867 formed a partnership with Mr. Hillebrand, which continued uninter-

Hosted by Google

ruptedly and successfully up to the day of his death. The deceased was of a quiet, unassuming disposition, but of excellent business qualifications, and was highly respected by the firm's numerous employees and by all who had the pleasure of his acquaintance. The business will be carried on by Mr. Hillebrand, under the old firm name of Hillebrand & Wolf, the Star Lock Works.

Washington News.

(*From our Special Correspondent.*)

WASHINGTON, D. C., October 17, 1893.

Commodore William T. Sampson, Chief of the Bureau of Ordnance, U. S. Navy, converses very interestingly upon the subject of naval ordnance and what has been accomplished by the Government of the United States. The Commodore is not only an experienced seaman, but an expert in ordnance. He commanded the "San Francisco," one of the finest of the new ships of the navy; was on duty at the torpedo station, and later Inspector of Ordnance at the Washington Gun Foundry, from which position he was promoted to his present important duty as Chief of Bureau. Commodore Sampson has completed his annual report, which will be ready in a few days. In taking a conversational retrospect of the year, he said:

The experiments in the different classes of armor plate were completed a year ago. These comprised tests of high and low carbon nickel steel, low carbon steel and nickel steel Harveyed. The results of those experiments have been amply sustained by the tests of lots of armor for the different ships under construction during the past year. We now use nothing but Harveyed plates for the armor of our vessels. They are undoubtedly the best plates made, not only in this but in any country.

As a matter of comparison the following shows the official results of the experiments, which have been borne out by subsequent tests:

Character of plate.	Maker.	Weight, pounds.	Total bolt cross section per ton of plate, sq. inches.
High carbon nickel-steel	B. I. Co.	20,494	5.71
Low carbon nickel-steel	C. P. & Co.	20,844	5.62
Low carbon steel Harvey	B. I. Co.	20,506	5.71
High carbon nickel-steel	C. P. & Co.	20,590	5.69
Low carbon nickel-steel Harvey	C. P. & Co.	20,220	5.79
High carbon nickel-steel Harvey	B. I. Co.	20,682	5.66

The plates, 8 feet by 6 feet by 10 feet 5 inches, were fastened by 12 bolts 2.36 inches in diameter, giving a total cross section of 52.29 square inches. The targets were set up so that the faces of the plate were on the chords of a circle whose center was the gun's pivot and whose radius was 73 feet 5 inches. The muzzle of the 6 inch B. L. R. was 57 feet 5 inches and the 8-inch gun 55 feet 5 inches from the face of the plate, the axis of the gun being then perpendicular to the plane of the plate.

The tests of plates this year have been for the "Indiana," "Massachusetts" and "Oregon," battle ships, and "Maine" and "Texas," armored cruisers. These plates have run up to 17 inches in thickness, and in every case have been successful.

We anticipate no trouble in working the high grade of plates we are now using on our battle ships. The work must be done on the plates; that is, the bolt holes put in before the plates are Harveyed. This will put a stop to a practice which is of doubtful expediency. Bolts are put in to hold the plates, and sometimes a row of them across the plates, which must necessarily weaken them. The bolt holes must now be located first and inspected, after which the plates can be Harveyed.

There will be no trouble in working the plates in this manner, and we will secure better results.

The work on the hulls of the ships is far ahead of the supply of armor. Here is a table which shows how we stand on that important subject:

Summary of Armor Contracts (to October 1, 1893).

Vessels.	Amount required and ordered—Tons.			Amount delivered to October 1, 1893.	
	Bethlehem.	Carnegie.	Total.	Bethlehem.	Carnegie.

Each nation claims a special merit for its own arm, but the Creusot is regarded as the best of foreign plates. This is made of steel of a high grade. But I have no hesitation in saying that a comparison of results of tests shows that we are in the lead. The nickel armor plate can be produced cheaper here than abroad. Many inquiries from expert sources abroad are being made concerning our wonderful nickel plate armor. The simple steel is almost certain to crack. The nickel plate is tougher and can better resist battering by the formidable armor piercing projectiles we have in these days and made in the United States.

I think our superiority in plate is being reluctantly conceded from abroad, and, being able to manufacture it cheaper here than there, it may open a new and valuable trade.

In reference to guns we are going ahead in the same line. We are making no change, but turning out guns of our own designs as rapidly as possible to meet the demand of the ships as they are required. We can now keep pace with the requirements of the ships as they are completed ready for their armament of high power B. L. guns.

We claim for our guns that they surpass the finest in the world. This many experts admit, and, we think, others will be compelled to as their work becomes better known. Our guns will stand a pressure of 32 tons to the square inch. This is 7 tons more than is required by the rules laid down by the Department. The 13-inch gun is the largest we are making at present. That is an effective gun for the best results in rapidity of handling and destructive power.

All carriages are of the Department designing. They are controlled by hydraulic power. Experiments are in progress in the application of electricity. This is now being experimented with in revolving the turrets. I have no doubt it will be applied to other uses about heavy guns. There is now a system of supplying guns by means of electricity.

The Krupp 110-ton gun is 16 inches, but a gun too large to be readily handled become really ineffective. Smaller guns quickly and more accurately handled are better. The most important tests which are now being made are with projectiles fired at an inclination. We find in this severe trial the projectiles are badly broken. When fired vertically to the plane of the plate they turn out all right, because in this case the parts of the projectile are supported, but fired at an inclination each part must depend upon itself. The result is as stated. We will continue our experiments in this line.

A meeting of the Association of Iron and Steel Sheet Manufacturers was held at their headquarters, in the *Times* Building, Pittsburgh, last week. The wage scale question was up for discussion and it was decided to postpone action until the vote now being taken by the lodges of the Amalgamated Association on the question of agreeing to a 10 per cent. reduction has been completed. As soon as the result of the vote is known another meeting of the association will be held to take suitable action.

Two natural gas wells have been tapped recently near Ballston, N. Y., and further drilling is in progress.

Hosted by Google

MANUFACTURING.

Iron and Steel.

Last week test operations were commenced at the new plant of the New Castle Steel & Tin Plate Company, New Castle, Pa. Only black plates were made, the tinning department not being completed. The result gave perfect satisfaction, plates produced being pronounced by experts equal in finish to any foreign make.

The partnership heretofore existing under the firm name of N. D. Doxey & Co., wherein N. D. Doxey of Elmira, N. Y.; Benjamin Maurice of Athens, Pa., and Charles J. Root of Elmira, N. Y., were partners, has been dissolved by mutual consent, Benjamin Maurice retiring. The Elmira Iron & Steel Rolling Mills will hereafter be operated by N. D. Doxey and Chas. J. Root, under the title of N. D. Doxey & Co. Messrs. Doxey and Root have long been identified with these mills, and will continue to produce plates, angles and merchant bar iron.

A petition has been filed in the Circuit Court at New Albany, Ind,, praying that a receiver be appointed for the New Albany Forge & Rolling Mill Company. The petitioners are holders of $50,000 of the first mortgage bonds issued by the company and secured by a lien on the plant.

After a shut down of two weeks the sheet mill of Summers Bros. & Co., at Struthers, Ohio, is again in operation.

Sarah Furnace of the Kelly Nail & Iron Company, at Ironton, Ohio, has resumed operations.

Frank L. Froment, iron and steel commission merchant, at Nos. 446 West and 161 and 163 Bank streets, New York, has made an assignment to Wylie H. Vilas, giving a preference to Mary E. Bacon of Boston for $10,000 borrowed money. He was the principal owner of the Blandon Iron & Steel Company of Blandon, Pa., who failed two years ago, and was also for several years president of the New York & Perry Coal & Iron Company of Shawnee and Straitsville, Ohio.

It is now announced that a settlement has finally been made between the Salem Wire Nail Company, Salem, Ohio, and their wire drawers. At one time it seemed as though a prolonged strike would result, but the men have concluded to accept a reduction of 10 per cent. Vice-President McEvery of the Amalgamated Association was instrumental in bringing about the agreement. It is understood that this settlement affects the Findlay, Ohio, mill also operated by this company.

The Union Iron & Steel Company of Youngstown, Ohio, have discharged their entire force with the exception of two men. In explanation of this action an official of the firm states that it was taken for the reason that it is very uncertain when operations will be resumed in any of the various mills of the firm.

Belfont Furnace of the Belfont Iron Works Company, at Ironton, Ohio, resumed operations last week.

The Carnegie Steel Company, Limited, have recently purchased 22 lots with a river frontage of 650 feet situated adjacent to the Homestead Steel Works, at Homestead, Pa.

The Monongahela Furnace of the Monongahela Furnace Company, McKeesport, Pa., which has been banked down for several months, will resume operations during this week. These two furnaces each turn out about 250 tons of iron every 24 hours.

The personal property of the Columbia Iron & Steel Company, at Uniontown, Pa.. was sold last week at sheriff's sale. The sale was brought about by executions amounting to $120,000, entered by Robert Hogsett, president of the firm, and the People's Bank of Uniontown. The most of the property was bought in by James A. A. Seabright, a director of the firm.

The Youngstown Bridge Company, Youngstown, Ohio, have the contract to supply the material for a tubular iron bridge, now under construction at Quincy, Ill., and which will cost $40,000.

The Falcon Iron & Nail Company, Niles, Ohio, have notified their employees of a 10 per cent. reduction in wages to take effect at once. This applies to all workmen except those whose wages are governed by the Amalgamated Association scale.

The Muncie Nail Company of Muncie, Ind., went into the hands of a receiver last week.

A number of puddling furnaces in the plant of the Clinton Iron & Steel Company, at Pittsburgh, Pa., were started up last week with non-union men, the price for puddling being set at $4 per ton. The firm state that so far they have had no trouble in securing competent men as fast as they could use them.

Last week notices were posted at the Edgar Thomson Steel Works, Bessemer, Pa., announcing that operations would be resumed in all departments on Monday morning, the 16th inst., at 6 o'clock. During last week the wages of some of the tonnage men were slightly reduced in order to have them conform more closely to wages paid for the same kind of labor at the Homestead Steel Works and other plants.

The Lockhart Iron & Steel Company, operating the Vulcan Forge & Iron Works, at Chartiers, Pittsburgh, have their muck and guide mills on double turn, while the bar mill is on single turn.

George B. Lessig, chairman of the Ellis & Lessig Steel & Iron Company, Limited, of Pottstown, Pa., at a meeting of the striking puddlers, made them two propositions. The first was to pay them $2.75 per ton, with small chance of steady work, and the second was to pay $2.50 per ton and guarantee them at least 15 days' work each month during the coming winter. We are advised that the men decided to accept the latter and will resume work on Monday.

Machinery.

The Jeffrey Mfg. Company, 163 Washington street, New York, and Columbus, Ohio, are installing an entire new plant for the Rumford Falls Paper Company, Rumford, Maine, from start to finish, for the economical hauling of logs from the river some hundreds of feet to a suitable place convenient to the mill, to be used as wanted. One of the objects is to provide a reserve for use in winter when the adjacent river freezes solid, although provided for the quick handling of logs at any time.

Among the sales recently made of the Stirling water tube safety boiler are the following: Adriance Platt & Co., Poughkeepsie, N. Y., manufacturers of Buckeye mowers and reapers, 250 horse-power; Simpson & Watkins, Scranton, Pa., three boilers (second order), 300 horse-power, and Lutz, Lilly & Co., Philadelphia, Pa. (second order), 250 horse-power. In the West Farms station of the Union Railway Company, New York City, 500 horse-power has recently been put into service and an additional 500 horse power ordered.

The Flemington Iron Foundry, at Flemington, N. J., has started up with a full force after nine months of idleness.

Smith & Hall, dealers in engines, boilers and general machinery at Macon, Ga., have made an assignment. The liabilities are estimated at about $25,000 and the assets at $20,000. The failure is attributed to dull trade.

The Tonkin Boiler & Engine Works, at Oswego, N. Y., have been completed and operations will begin at once.

W. F. & John Barnes Company of Rockford, Ill., manufacturers of machinery and mechanics' tools and supplies, report a material increase in orders and a much better inquiry for prices, indicating that, despite the delay at Washington, business is assuming a firmer tone. The company have been operating their plant with a force equivalent to one-half on full time; but during the past two weeks have put more men at work, and will continue to increase their force as business warrants.

H. H. Buzzell & Son are about to start a brass foundry at Laconia, N. H.

D. J. Bolenger's Foundry, at Waynesburg, Ohio, has been burned. Loss, $5000; insurance, $500.

The Ferracute Machine Company of Bridgeton, N. J., manufacturers of presses, dies and other sheet metal tools, have kept their works running during the entire summer with a part of their force. Orders are now coming in much better than a month ago, and trade prospects seem much brighter.

The works of the Birdsall Company, manufacturers of steam engines grain threshers and portable sawmills, at Auburn, N. Y., have been closed by the sheriff on an execution of $165,000. The judgment was in favor of Henry H. Cook of New York City, and is for money loaned to the concern. An hour after the judgment was filed a chattel mortgage for $75,000 in favor of H. H. Cook and Nelson Beardsley was filed.

Aultman, Miller & Co., mower and reaper manufacturers, of Akron, Ohio, have just completed the erection of a new foundry. The building is 400 x 100 feet in size, the molding room being 300 x 100. The remaining 100 feet of length is taken up with pattern rooms, core rooms, &c. The cupola is of the Whiting design, furnished by the Detroit Foundry Equipment Company of Detroit, Mich. For heating and ventilating the Sturtevant system is used, put in by E. H. Jones & Co. of Cleveland, Ohio. It is probable that this new foundry will be put in operation during this month.

The Enterprise Machine Company of Elyria, Ohio, have been chartered, with a capital stock of $10,000, for the purpose of manufacturing and selling all kinds of machinery and conducting a general foundry business.

The Pittsburgh Gauge Company of Pittsburgh recently received an order from the United States Government for a number of special safety water columns of phosphor bronze, nickel plated and polished, with water gauges and gauge cocks. These will be placed in the Treasury Building at Washington.

The Glover Foundry Company, Limited, New Castle, Pa., advise us that they have recently received some fairly large orders for annealing boxes, housings and chilled rolls.

The Stillwell-Bierce & Smith-Vaile Company of Dayton, Ohio, have declared a dividend of 2 per cent. on the preferred stock, payable October 16.

The Cowles Engineering Company, which did a large business at 43d street and the East River, Brooklyn, N. Y., has failed. Vaulx Carter is the assignee. The company were incorporated three years ago to design, build, repair and alter steam engines and boilers. William Cowles, formerly a mechanical engineer and draftsman in the Navy Yard, is president of the company. The assignee was the treasurer. The company built the fireboat David A. Boody for Brooklyn, and two other fireboats. Among the creditors are Nathanael F. Bacon of Syracuse, $130,000; R. Hazard, Rhode Island, $9,500; Thomas F. Nevins, Brooklyn, $8,470; First National Bank, Syracuse, $6,000; E. F. Rice, Syracuse, $7,025, and G. W. Schmidt, New York, $1,000—all for money lent. Considerable amounts are owing to various firms and the workmen have not been paid $1,800. There are seven attachments for $30,000 in the Sheriff's hands against the company.

The Patapsco Iron Company, for the manufacture of metal castings and machinery, have been incorporated in Baltimore, Md., by Robert R. Zell and Wm. J. O'Brien, Jr.

Hardware.

The Northwestern Barb Wire Company, Rock Falls, Ill., commenced operations on a small scale on the 2d inst., and expect to put on their full force in the near future.

A cut down of 10 per cent. in all departments of the Concord Axle Works, Penacook, N. H., went into effect on the 9th inst.

Blenkhorn & Son's axe factory, at Canning, N. S., was destroyed by fire on the 29th ult. Loss, $8000; insurance, $1000.

The Eagle Lock Company, Terryville, Conn., have commenced to work on short time and until further notice will run only four days per week.

The shovel works of the Oliver Ames & Sons' Corporation, North Easton, Mass., are running but nine hours a day.

The Vermont Farm Machine Company, Bellows Falls, Vt, closed down on the 30th ult. for the annual inventory. Advantage will be made of the shut down to make needed repairs.

At the annual meeting of the stockholders of the Portland Screen Company, Portland, Maine, the following persons were elected directors: W. S. Eaton, Wm. H. Stevens, F. A. Neal, Chas. W. Allen, Chas. J. Chapman, Fred. E. Haskell and Lewis A. Goudy. W. S. Eaton was elected president and Chas. R. Lewis treasurer. The reports of the officers showed that the company have earned a gratifying profit on

Hosted by Google

the business of the past year, and a dividend of 6 per cent. was declared.

The Ely Hoe & Fork Company, St. Johnsbury, Vt., have resumed operations, after spending about $5000 on repairs to the works, putting in a new dam, &c.

The Western Screw Company, Chicago, Ill., have been incorporated, with a capital stock of $100,000. The incorporators are Michael J. Dunne, John T. Boos and Frank M. Burwash.

The Canton works of the Cleveland Axle Mfg. Company, Cleveland, Ohio, have resumed operations with a force of 160 hands. It is expected that 200 will be employed by November.

Wellsboro, N. Y., is to have a new industry in the form of a lock factory. A stock company has been formed, with a capital of $50,000, $10,000 of which has already been raised.

The Peck, Stow & Wilcox Company's main factories, at Southington, Conn., are again in full operation.

Lees Mfg. Company, Westport, Conn., are making over 100 different kinds of twine and make special twine for any purpose and put up in any way. They are running full time, and have only stopped for two weeks during the present year.

Clayton Bros., manufacturers of steel laid and cast iron shears, hardware specialties, &c., Bristol Conn., and 122 Chambers street, New York, have enlarged their plant so that their facilities for filling orders are much improved.

W. H. Davenport Fire Arms Company, Norwich, Conn., are preparing new designs and models for next year's business, and are intending to issue a complete catalogue which will represent their present as well as their new models.

The Frazier Cycle Company, 373 and 375 Wabash avenue, Chicago, with factory at Aurora, Ill., have so far built no bicycles, their attention having been confined exclusively to the manufacture of pneumatic sulky wheels, ball bearings for high wheels, &c.

The Kilmer Mfg. Company, Newburg, N. Y., are extremely busy and behind their orders.

The loss in the fire at the works of the Clinton Wire Cloth Company, Clinton, Mass, on April 19 last, has been adjusted, the loss being fixed at $170,000. This covers the loss to buildings, machinery and stock in process of manufacture. Through the system of insurance followed, the company's loss not covered by insurance is very small. Work on the new mill is progressing rapidly. The mill will be ready for the placing of machinery about December 1.

The factory of F. E. Myers & Bro., Ashland, Ohio, is now running full force. The firm have made a number of valuable improvements and are better equipped than ever before. They have recently placed a new 15-ton Colliau cupola in their foundry, and refitted the cleaning room with the latest equipments in that line, which will increase the capacity of the foundry nearly one-half.

J. E. Rhoads & Sons, manufacturers of oak tanned leather belting, Wilmington, Del., and 229 Market street, Philadelphia, make specialties of heavy driving belts and Volto dynamo belting, which they refer to as a superior brand and which is treated with their preparation for increasing adhesive power and pliability. They have recently put in several new machines and have a very well equipped shop. They have several power presses, the widest of which will make a 72-inch belt. They also have improved machines for working, stretching and finishing their leather. The firm are also dealers in lace leather, rubber belting, hose, packing, &c.

The Gormully & Jeffery Mfg. Co., Chicago, are preparing to build a new eight story factory, 120 feet long, which will afford additional floor space of 1⅛ acres. For this purpose they are tearing down the old warehouse, corner of North Franklin street and Institute Place, Chicago.

Bissell Carpet Sweeper Company, Grand Rapids, Mich., have recently completed a six-story addition to their factory. Something like 54,000 square feet will thus be added to their floor space, with a corresponding increase in their manufacturing capacity. Their plant now contains about 160,000 square feet of floor space. The factories throughout are designed for the special convenience of the carpet sweeper business, and much of the machinery differs materially from that in use in any other line of manufacture. Every precaution has been taken against fire and the buildings are regarded as thoroughly fire proof. The very large sale which the Bissell sweepers have had is evidenced by the fact that during the past seven years the factory floor space has been quintupled. The capacity of the works now exceeds 1200 sweepers per day. Branch stores of the company are located in New York, Boston, London, Rotterdam, Hamburg, Melbourne and Sydney.

The American Ormonde Company, New York, will hereafter conduct their wholesale and retail departments entirely independent of each other. The wholesaling will be done at a new depot, soon to be opened in the down town portion of the city, while their retail department will be carried on in their new store, 135 West 125th street. It is understood that the Ormonde wheel will in future be manufactured in this country, and not imported, as formerly.

The Homer D. Bronson Company, Beacon Falls, Conn., make a specialty of fine art metal work of electro bronze from architects' drawings, models, carvings, &c., for interior decoration of all descriptions, including panels for dadoes, friezes, doors, mantels, sideboards, houses, steamboats, palace cars, furniture, pianos and organs, billiard tables, &c. The company have just completed a quantity of ornamental bronze work finished in gold for the Columbus Building, Wabash avenue, Chicago, from architect's designs. In addition to the above work the company manufacture wrought brass butt hinges, finely polished and plated piano and organ hinges, continuous and sectional hinges for every purpose, any width and length, fancy and irregular shapes to order, wrought brass pressure bars and brass goods in general.

Yale & Towne Mfg. Company, New York, have received the contract for refitting the New York Post Office with an entire new outfit of lock boxes. They recently fitted the new branch post office in the Industrial Building, at Forty-third street and Lexington avenue, New York, with all of its post office furniture, including routing, letter distributing, pouching and mailing cases, tables and all the paraphernalia of a complete post office.

The League Cycle Company, Hartford, Conn., advise us that their orders for their chainless safety have forced them to work overtime and that the capacity of their plant has been tripled, a fact which they refer to as indicating the merits of their wheel and its excellent workmanship, finish and design. The company are contemplating making large additions to their plant in the way of new and improved machinery and expect to have an excellent season in 1894.

Franklin Brass & Bronze Company have about finished a new factory at Derby, Conn., which they expect to occupy and operate the latter part of this month. They will manufacture the same class of goods formerly made by the Franklin Brass Company, at their factory in Buchanan, Va., destroyed by fire two years ago, soon after starting up. They now have at Derby a well equipped plant for producing refrigerator and box trimmings, hinges for water closet seats, hasps, door numbers, molding hooks, cabinet and builders' hardware, escutcheons, shutter bars, flush lifts, brackets, cabinet hinges and butts. They expect to increase their line of builders' hardware largely They have a foundry also for casting special goods to order, and will make this department a feature of their business. W. F. Brainerd will be in charge of the business at 111 Chambers street, New York.

Mossberg Mfg. Company, Attleboro, Mass., have recently united their Attleboro and North Attleboro plants and added to them by the purchase of additional machinery, so that they now occupy a new building with more than double their former floor area. With a better arrangement of departments and improved methods the company are now in a position to produce any work in their line more satisfactorily and economically than ever before. It is the company's intention in the future to always carry a complete line of jewelers' tools, while still paying particular attention to designing and constructing special complicated and automatic machinery of any kind.

Miscellaneous.

A force of over 200 men is now employed at the Terre Haute Car & Mfg. Company's works at Terre Haute, Ind., repairing freight cars and finishing the construction of the two frame buildings located on the ground recently made vacant by the burning of the plant.

Benj. D. Stone of New York has been appointed receiver for the firm of Reubel & Taylor, manufacturers of brass goods, at Rome, N. Y. The liabilities are said to be $17,000 while the nominal assets are much larger.

The Mount Vernon Car Mfg. Company of Mount Vernon, Ill., have certified to an increase of capital stock from $150,000 to $200,000.

The Chattanooga, Tenn., Car & Foundry Company are running in all departments and have a good number of orders ahead.

John V. Bacot of Jersey City and J. Friedenstein, president of the Anglo-American Iron & Metal Company, 213 Pearl street, New York, have been appointed joint receivers for the property in New Jersey, and Mr. Friedenstein has been confirmed as ancillary receiver for the property in New York. Assurances of support from the great majority of creditors have been received, and with the preparation of a statement of the condition of the company, which will be ready in a few days, it is believed that a continuance of the business under a receivership will be of short duration. The business will be continued on the same lines as heretofore, and the installment of a receiver will not in any way affect it.

Manager Kruesi says, regarding the rumor that the United States Wire & Cable Company had been absorbed by the Edison General Electric Company of Schenectady, N. Y., that the Wire & Cable Company have always been owned by the Edison Company, but had of late been conducted as a separate concern. Now a change has been made so that it will be conducted as a department of the Edison General Electric Works. Manager Kruesi also says that the force at the works is being increased.

The expanded metal works of Chess, Cook & Co., Rankin Station, Pa., are now running.

Eight new locomotives, constructed by the Rhode Island Locomotive Works of Providence, R. I., for the Manhattan Elevated Railway of New York, have been delivered.

The Charles Munson Belting Company of Chicago have received second advice from the Toledo Electric Company of Toledo, Ohio, that the 80-foot belt which they placed in the plant eight weeks ago is running just the same as the first day it was placed on the pulleys. This belt has been running steadily and overtaxed by work ever since that time, and the belt shows no signs of labor whatever.

The New Howe Sewing Machine Company, at Orange, Mass., have placed the contract with the Berlin Iron Bridge Company of East Berlin, Conn., for a new foundry and tumbling room. The building will be entirely of iron, 45 feet in width and 120 feet in length.

The strike of boiler makers in the shops of the Big Four system at Indianapolis, Ind., has led to violence and bloodshed, one man having been killed in an attack made by the strikers on the workmen who had taken their places.

A press dispatch from Philadelphia says that the Baldwin Locomotive Works of that city on Saturday again reduced their force in all departments. Unless there is a marked improvement in business there is a likelihood of a complete shut down. Last year at this time 5890 men were employed on double time. Now but 2480 are employed on half time. Then from 20 to 24 locomotives were turned out weekly. Now from three to five are made.

On the application of John A. Roebling's Sons Company of Trenton, N. J., the court has appointed a receiver for the Kokomo Stamping Company, successors to the U. S. Projectile Company, Kokomo, Ind. The concern were reorganized August last, and the capital stock placed at $50,000. The general business stagnation of the country is said to be responsible for the failure.

Officials of the Bath, Maine, Iron Works deny the report that there is any likelihood that the concern will be removed from Bath to New London, Conn. Nevertheless the New London Board of Trade has appointed a committee to look into the matter.

The statement of the Michigan Peninsular Car Company for the year ended August 31, 1893, shows net earnings of $866,906, which, after paying fixed charges, includ-

Hosted by Google

ing a dividend of 8 per cent. on the preferred stock, leaves something more than 18 per cent. profit. Eight per cent. was paid on the common stock, and a little over 10 per cent. carried to the surplus fund. The cash assets of the company amount to over $3,000,000, and the fixed assets to over $7,000,000.

The Litchfield, Ill., Car & Machine Works may be removed to Memphis, Tenn.

The Western Iron Works have secured two contracts for work on the Mechanical Arts Building to be erected for the California Midwinter International Exposition at San Francisco. The Judson Iron Works will have the work on the Liberal Arts Building at a fixed price per pound.

Among recently authorized corporations in Illinois are the following: Globe Tin Plate Company, at Chicago; capital stock, $45,000; for the manufacture of tin and terne; incorporators, James Spruce, William Killmer and Henry C. Gager. Schoolhouse Construction Company, at Peoria; capital stock, $100,000; to build schoolhouses and for general contracting; incorporators, William D. Dickson, Henry Sandmeyer, Jr., and George F. Page. The Fullner-Danhoff Electric Company, at Chicago; capital stock, $5,000,000; for the manufacture of electric light, heat and power; incorporators, Franz Fullner, A. B. Coon, Henry A. Gates and William B. Keep. Western Screw Company, at Chicago; capital stock, $100,000; for the manufacture of hardware and machinery; incorporators, Michael J. Dunne, John T. Booz and Frank M. Burwash. Wabash Truss Hoop Company, at Mount Carmel; capital stock, $10,000; for the manufacture of coopers' supplies and wagon materials; incorporators, Philip S. Reyman, Henry H. Mason and L. W. Miller.

At a meeting of the stockholders of the Allegheny Heating Company, suppliers of natural gas, with headquarters in Allegheny, Pa., the old Board of Directors was re-elected and the following officers were chosen: George Westinghouse, president; J. R. McGinley, vice-president; John Caldwell, treasurer, and W. D. Uptegraff, secretary.

A statement recently issued by the treasurer of the Philadelphia Natural Gas Company of Pittsburgh shows the condition of that concern on September 30, 1893, to have been as follows:

Debt.

Accounts payable	$62,000.00	
Security deposits	73,524.00	
Bonds	139,000.00	
		$274,524.00

Available Assets.

Cash	$402,676.42	
Accounts and bills receivable	310,086.15	
Stock in other companies (paying dividends)	385,970.00	
		$1,098,732.57

The company during the quarter retired $20,000 additional bonds. On June 30, 1893, the cash item amounted to $515,000, and on September 3, 1892, it was $228,000.

The entire plant of the Westinghouse Air Brake Company, at Wilmerding, Pa., is closed down for 30 days. During the shut down a new battery of boilers will be erected and other improvements made.

The Pitts Mfg. Company, the last agricultural implement concern in Will County, Ill., will be moved to Chicago this week and located at Columbia Heights. The castings, stock and machinery of the big plant were placed on freight cars last week ready to begin shipment on Monday. When in operation the new plant will give employment to between 500 and 800 skilled mechanics.

Mayor Latrobe and Charles T. Crane of Baltimore, Md., have been appointed receivers of the South Baltimore Car Building Company, one of the largest concerns of its kind in the country. The financial stringency is given as the cause of the embarrassment. The assets are about $617,000, and the liabilities $294,000. The company have been in operation several years, employs hundreds of men, and have a large plant at Curtis Bay, a few miles from Baltimore.

The Gilbert Car Works, on Green Island, near Troy, N. Y., have resumed operations after a shut down for six weeks under a receivership. Employment was given to nearly 300 men. The works are sure to run until 50 cars for the Lake Street Elevated Road in Chicago have been completed.

TRADE REPORT

The best that may be said is that the past week has not brought any more particularly unfavorable developments in the Iron trade proper. Like every other industry and business throughout the country, it is suffering from the failure of the Senate to put our currency question into proper shape. With admirable patience the business community has suffered without displaying more than pardonable exasperation. We do not believe that this phase will last much longer. It will take but a small impulse to bring about the ears of the Senators a cyclone of wrath from the business world which will put an end to dallying. It will be made apparent who are the masters and who are the servants.

Every day's delay pushes further into the future the prospects of a recovery. Every day's delay drags nearer to the brink of bankruptcy many merchants and manufacturers. It is steadily sapping the vitality of the strongest. Business men not only owe it to themselves but to their employees to adopt vigorous measures. When the threatened bread riots come this winter, with their loss of life and of property, they will not be quite free from their share of blame, since they have not yet exhausted their power of coercion.

From the majority of the Iron trade centers comes the same talk of discouragement. In isolated cases there are reports that a moderate volume of business is coming up, but orders which would hardly cause comment in ordinary times are eagerly pointed to now as offering some encouragement.

How light the purchases of the railroads are, who are the greatest customers of the iron industry, is proven by the report that during the whole month of December the deliveries of Steel Rails by the mills amounted to 32,000 tons, or about one-fifth of what they ought to be in ordinary times. While it is true that special circumstances may have led to singling out this branch as the dullest in the whole industry, we believe that statistics relating to the car shops and the locomotive builders would display very striking figures too. The Iron trade needs the immediate repeal of the purchasing clause of the Sherman act, and wants peace for a long time after that.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., October 17, 1893.

The situation as regards the market for Iron and Steel shows only slight changes from last week, and these not altogether of a favorable character. The only good feature is a better demand for rolling mill products, although without any corresponding increase in prices. The shipyards are taking material somewhat freely, and with further inquiries from this source, and for architectural purposes, manufacturers are beginning to feel that there is a reasonably good prospect of being able to keep their machinery in operation. In other departments there is no improvement whatever, and the outlook for the winter months is anything but cheering. Nevertheless, prices are down to a point beyond which it is almost impossible to show further recession, and with an output of Pig Iron only about 40 % of what it was during the first six months of the year, it is surely time to look for something of a reaction. The spirit of speculation has been so thoroughly crushed, however, that on the principle that "sufficient for the day is the evil thereof," there is very little disposition to operate, except to cover contracts actually in hand.

Pig Iron.—The feeling as regards Pig metal is exceedingly dull. Prices are weaker and lower, yet with a production of only 40 % of what it was a few months ago, there is more unwillingness to buy than when prices were very much higher and production twice as large as it is to-day. This can only be explained by the fact that consumers have very few orders on their books, and that recent experience has shown that no matter how cheap they might secure Iron one day, they could do still better in their next purchase. This, of course, cannot continue indefinitely, and there is little doubt that prices are either at rock bottom or within sight of it, but all the same there is no disposition to buy anything that is not actually needed, no matter what inducement may be offered as regards prices. The usual quotations are about $12 @ $12.50, delivered, for standard brands of Gray Forge; $13 @ $13.50 for No. 2 Foundry, and $14 @ $14.50 for No. 1. Southern Irons can be had at less money, several lots having changed hands at $11.50 @ $11.75, with a fair chance that orders could be readily placed at the same or slightly lower figures for good sized lots and prompt settlements.

Steel Billets.—Prices are still on the down grade, with sellers at $19.75 @ $20, but very little demand. For 1000s ton lots it is thought that $19.50 or less would be accepted, but as consumers' requirements are only moderate bids are not forthcoming, except for very small lots. Sales were made in lots of 100 to 200 tons each at $20 @ $20.25, but more recently the feeling has become weaker, and $20 would be regarded as a full quotation for any kind of an order, and from that down to $19.50 or less for a good sized lot.

Finished Material.—The market is looking better as regards the volume of business, but not as regards prices. There are several inquiries from the shipyards, which, with the work taken during the early spring, is helping the mills considerably. There is also something doing in buildings; one at Tenth and Filbert, in this city, will call for 1500 tons, the Boys' High School will take sev-

Hosted by Google

eral hundred tons more, so that there is a little business around, although compared with the capacity it is a mere drop in the bucket. The general demand for small lots is also pretty fair, but taking the most hopeful view of the situation, the prospect for winter work is less favorable than for years past, and if mills make half time it is about as much as can be hoped for, unless some very unexpected change occurs. Prices are weak, and on any good sized order it is easy to secure liberal concessions from quotations on small lots, which are about as follows:

Grooved Skelp, delivered	1.50¢	@	1.55¢
Best Refined Bars	1.55¢	@	1.60¢
At interior points	1.50¢	@	1.55¢
Tank Steel	1.60¢	@	1.65¢
Heavy Plates	1.65¢	@	1.70¢
Shell	1.75¢	@	1.85¢
Flange	2.00¢	@	2.20¢

Old Material.—The market is extremely dull, and prices liable to weaken under any extra pressure to sell. Asking prices are about as follows:

No. 1 Wrought Scrap, delivered	$12.00	@	$13.00
Machinery Cast, delivered	10.00	@	11.00
Heavy Steel Scrap, delivered	13.00	@	14.00
Old Iron Rails, delivered	15.00	@	16.00
Old Street Rails, delivered	17.00	@	18.00
Wrought Turnings, delivered	10.00	@	11.00
Cast Borings, delivered	6.00	@	7.00
No. 2 Light Scrap	6.00	@	7.00

Dreifus, Block & Co. of Pittsburgh, dealers in Iron and Steel Scrap, Billets and Muck Bars, have recently opened an office at 421 Chestnut street, Philadelphia, under the management of E. Dreifus.

Janney & Steimetz are among the latest candidates for business in Coal, Coke, Iron, Steel and Aluminum. The last mentioned article is to be made one of their leading speciaities, both in the ingot and in its manufactured shape. Their office is in the Philadelphia Bank Building, 423 Chestnut street.

Chicago.

(*By Telegraph.*)

Office of *The Iron Age*, 59 Dearborn street, CHICAGO, October 18, 1893.

No improvement can be discerned in the condition of trade. Everything is waiting. A great deal of business is reported in prospect which might be transacted at an early date if Congress would act decisively on the currency question, but every day lost makes the prospects fainter for anything of consequence this year. Many are of the opinion that not much can now be expected before next spring.

Pig Iron.—But few sales during the past week are of sufficient importance to mention. Among these were 500 tons Southern Coke Foundry, 500 tons Lake Superior Charcoal, 300 tons local Coke and a few 100-ton lots. Carload orders have been fair but not very numerous. Some Iron houses reported the past week as one of almost complete stagnation with them. In view of the very low prices reported elsewhere it may be interesting to state that Southern Mottled Iron has been sold here within the past few days at $10.85, equivalent to $7 at furnace. The attitude of the Southern companies represented here is one of continued firmness and our quotations represent actual prices obtained. Buyers are reported to be generally satisfied with present prices and the only question with them is that of getting orders for their own products, when they would be glad to place contracts for the Pig Iron required. Shipments of Coke Iron from the furnaces are steadily increasing, largely on account of the growing consumption of agricultural concerns. Some little improvement, however, is noticed in the consumption by general foundries. The sale of Charcoal Iron reported was on account of a bankrupt company, but it brought a price fully equal to our quotations, which shows remarkable strength in that class of Iron. Quotations are now as follows for cash:

Lake Superior Charcoal	$16.00	@	$16.50
Local Coke Foundry, No. 1	13.50	@	14.00
Local Coke Foundry, No. 2	12.75	@	13.00
Local Coke Foundry, No. 3	12.50	@	12.75
Local Scotch	14.00	@	14.50
Ohio Strong Softeners No. 1	15.50	@	16.00
Southern Silvery, No. 1		@	14.50
Southern Silvery, No. 2		@	14.00
Southern Coke, No. 2	12.35	@	12.60
Southern Coke, No. 3	11.60	@	11.85
Southern, No. 1, Soft	12.35	@	12.60
Southern, No. 2, Soft	11.85	@	12.10
Southern Gray Forge	11.10	@	11.35
Tennessee Charcoal, No. 1	16.00	@	16.50
Alabama Car Wheel	18.50	@	18.75
Hocking Valley, No. 1	15 25	@	16.00
Jackson County Silvery	16.00	@	17.00

Bars.—Considerably more inquiry is reported and some sales have resulted. The quantity purchased, however, falls very much under the usual amounts bought by the same parties under ordinary circumstances. Carload lots are now about the general run of business and larger sales are rare except on season contracts. One good agricultural contract was placed last week. Specifications are coming in a little more freely on season contracts also. The tendency noted some time since to substitute Steel for Iron is not so marked. The price of Common Iron is now so much below that of Steel that Iron is maintaining a good position in the market. Prices for ordinary lots of Bar Iron, mill shipment, range from 1.42½¢ to 1.45¢, half extras, Chicago. Soft Steel Bars of good quality sell at 1.57½¢ @ 1.60¢. Jobbers have experienced a little better business during the past week, but much of this is attributed to orders received from large consumers who are buying from store in small quantities rather than from mill. Prices on small lots from stock are weak at .65¢ @ 1.70¢ for Bar Iron and 1.70¢ @ 1.75¢ for Soft Steel Bars.

Structural Material.—No large contracts are reported. Business in small lots is fair. Steel is now entering quite considerably into the construction of much smaller buildings than hitherto. Architects are even considering the desirability of specifying Steel Beams for certain uses in dwellings. This is expected to be an important development of the present era of low prices. Quotations are maintained at the following prices on mill shipments, Chicago delivery: Beams, 1.75¢ @ 1.90¢; Tees, 1.95¢ @ 2.05¢; Angles and Universal Plates, 1.75¢ @ 1.80¢.

Plates.—If there was any business of consequence prices from mill would be considerably reduced. Current business is confined to such small lots, however, that our quotations fairly represent the market. Mill shipments, Chicago delivery, are quoted as follows: Tank Steel, 1.75¢ @ 1.80¢; Shell Steel, 2¢ @ 2.10¢; Flange Steel, 2.15¢ @ 2.30¢; Fire Box, 2.75¢ @ 5¢. Store prices now prevail as follows: Iron or Steel Sheets, Nos. 10 to 14, 2.25¢ @ 2.40¢; Tank Steel, 2.10¢ @ 2.20¢; Shell Steel, 2.20¢ @ 2.40¢; Flange Steel, 2.50¢ @ 2.65¢; Boiler Tubes, 70 %.

Sheets.—The demand for Black Sheets is excellent from mills in a position to make prompt deliveries. Jobbers are not holding prices firmly from stock, and in some cases are reported to have named figures very close to quotations now current from mill. They are doing better on Smooth Iron and Sheet Steel. Quotations on mill shipments, Chicago delivery, for No. 27 Common Black Sheets range from 2.75¢ to 2.80¢, while small lots from stock sell at 2.90¢ @ 3¢. Galvanized Iron has been in remarkably good demand and for the first time in many months some of the mills have refused to take further orders, as their capacity is covered for the immediate future. Juniata Galvanized continues to be quoted at 75 % off for mill shipment with freight added. Sheet Copper is in light demand, but is still quoted at 30 % @ 35 % off, according to quantity.

Merchant Steel.—More specifications are coming in on season contracts than in previous weeks, but still not in sufficient quantities to satisfy the manufacturers, who fear trouble in making prompt deliveries later in the year. Some new business has been entered during the past week from season buyers, and a fair trade has been done with the mills by jobbing houses. Mill shipments, Chicago delivery, are quoted as follows: Smooth Finished Machinery, Tire and Open Hearth Spring Steel at 1.90¢ @ 2¢; Ordinary Bessemer Machinery, 1.60¢ @ 1 65¢; Ordinary Bessemer Tire, 1.55¢ @ 1 60¢; Ordinary Tool Steel, 6¢ @ 7¢; Specials, 12¢ and upward.

Rails and Track Supplies.—The manufacturers of Track Material are deriving some encouragement from the increasing freight business reported by railroads running West and Northwest. They are doing a great deal more in transporting grain and provisions as well as merchandise, but the Coal and Iron shipments are still very light. A few orders for moderate quantities of standard sections were received during the past week, but the volume of business both in standard and light sections has been small. Standard sizes are unchanged at $30 @ $32; and Light Rails $31.50 @ $32. Iron and Steel Splice Bars 1.60¢ @ 1.65¢; Track Bolts with Hexagon Nuts, 2.50¢ @ 2.55¢; Spikes, 1.85¢ @ 1.90¢.

Old Rails and Car Wheels.—No transactions are reported in Old Iron Rails, but railroads are weakening and some have asked for offers from consumers of $14.50. The latter, however, are now convinced that they will be able to buy cheaper, and are disinclined to offer even $14. Old Steel Rails in long lengths are sold at $10 @ $10.25. Short pieces are worth $7.50 @ $8 on a parity with prices at Eastern points of consumption. Old Car Wheels are very quiet, and while single carloads are quoted at $13.50 @ $14, a large lot could not be sold except at a very material reduction from these prices.

Scrap.—The sale of a round lot of No. 1 Forge is noted. There are plenty of other inquiries, but buyers are trying to force prices lower than dealers are willing to accept. The demand for low grade Scrap is light. Steel is still neglected and Mixed Steel is now offered at a very low rate. Dealers' selling prices, net ton, are as follows: No. 1 Forge, $10; No. 1 Mill, $8; Sheet Iron, $5; Pipes and Flues, $7.50; Axles, $15; Horseshoes, $10; Fish Plates, $12.75; Spikes and Bolts, $10; Cast Borings, $5; Wrought

Hosted by Google

Turnings, $6.50; Axle Turnings, $8; Heavy Cast, $9; Stove Plate, $7.75; Malleable Cast, $8; Mixed Steel, $7, gross ton; Leaf Steel, $14 50.

Metals.—Carload lots of Lake Copper are unchanged at 10⅜¢ and casting brands maintain the old price of 9¼¢, with very little doing. Considerable inquiry has been received for Spelter, but sales are light. It is now quoted at 3.50¢. Lead has been reduced to 3.25¢ @ 3.30¢, with plenty of sellers but very few buyers.

Pittsburgh.

(By Mail.)

Office of *The Iron Age*, Hamilton Building, Pittsburgh, October 17, 1893.

The same discouraging report of the condition of the Iron and Steel trades must be repeated this week. A very thorough canvass made among the trade here reveals the fact that as yet there is no indication of an early improvement, either as regards demand or prices. No one believes that things are going to remain as they are for all time, but it is the general impression that it will be very slow work to lift the Iron and Steel trade out of the rut into which it has gotten. Buyers seemingly have no confidence that bottom has been reached, and each time they enter the market they expect to buy to better advantage than before. Pittsburgh, with its unrivaled facilities for cheap production, continues to set the pace in naming low prices that practically leave makers in other sections entirely helpless. It would seem that a few leading makers have concluded that if they can earn interest on the investment until trade resumes something like its normal condition, it is better to run as full as they can, making the securing of orders the first consideration and prices the second. It is also evident that a determination exists in certain quarters to find out how low competitors can go before they will cry "enough." All this has largely brought about the present low range of values, until, as one maker aptly puts it, "it is no longer a question of quoting a price, but a question of how much you can get." In Plates the competition has been especially severe, and on fair sized orders prices have been made that are almost beyond belief. In Billets, too, the determination of one or two makers to take everything in sight has resulted in prices being hammered down until neither buyer nor seller can tell "where he is at." The large stocks of Pig Iron in hands of makers, coupled with the light demand and the eagerness to sell, have forced prices to a point where it is doubtful if the furnaces can come out whole. The situation, summed up, could hardly be worse, and the long hoped for change for the better cannot come too soon.

Pig Iron.—The market continues a waiting one, and although buyers are aware of the fact that furnaces are offering their product at about cost, or perhaps below, orders continue to come in for immediate requirements only. For a long time past buyers have had everything pretty much their own way, and they have not failed to make good their advantages. However, this may change sooner than expected, and when it does come it is not likely that producers of Pig Iron will be slow in making just as good use of their opportunities. Production in this district has been increased to the extent of about 250 tons per day by the blowing in of the stack of the Monongahela Furnace Company, at McKeesport, on Mill Iron. Their other stack remains idle. For ordinary lots asking prices are as follows:

Neutral Gray Forge	$10.50 @	$10.75,	cash
All-Ore Mill	10.75 @	11.00	"
Bessemer Pig	11.25 @	11.50	"
No. 1 Foundry	12.50 @	13.00	"
No. 2 Foundry	11.50 @	12.00	"

We note a sale of 500 tons of Gray Forge Iron at a price equal to $10.60, Pittsburgh.

Billets.—A very limited amount of Steel is changing hands, and prices continue to depend altogether upon size of order and terms of payment. For ordinary business makers continue to ask $18 at maker's mill. There is a probability that for a good-sized order and favorable terms of payment some makers would shade this price. Other makers, however, seem to regard $18 as the stopping place, and are inclined to refuse business at anything under that figure.

Steel Rails.—After a shut down of some months, the Edgar Thomson mill has again resumed, though not to full capacity. It is stated that enough orders are on hand to insure about 15 days' operation. It is now pretty generally admitted that $29 does not represent the actual price on which orders are based, but that the price is shaded more or less, according to conditions. The Light Rail department of this plant is also in partial operation.

Ferromanganese.—We continue nominal quotation of $55 at maker's mill for domestic.

Muck Iron.—With Billets at $18, there is very little chance for Muck Bar, and there is practically nothing doing. We make nominal quotation of $20.50 at buyer's mill.

Wire Rods.—There continues to be a very fair movement in Rods, and most of the mills have about all the business for October that they can handle. For November and December delivery $26 at maker's mill is asked. A deal involving some 4000 or 5000 tons for delivery into next year is pending and may be closed before this week is out.

Structural Material.—Considering the fact that the active building season is about over, the demand keeps up fairly well. Of course no large orders are being placed, but the tonnage from the small buyers is fairly large. We quote as follows: Beams up to 15 inches, 1.50¢ @ 1.60¢, according to order. Angles and Universal Plates, 1.60¢ @ 1.65¢; Tees, 1.75¢.

Plates.—From a large maker we have reports of a slightly better demand, but none of the mills have enough business to give them full employment. It is in this department that prices have been cut to an unusual degree. For ordinary lots mills quote about as follows: Tank, 1.50¢; Shell, 1.65¢ @ 1.70¢; Flange, 1.80¢; Fire Box, 2.50¢ @ 4.50¢, according to quality. The quotation on Tank Steel continues to be shaded more or less for desirable business.

Merchant Steel.—Buyers are placing their orders a little more freely, although some of the largest buyers who have heretofore placed their orders for season requirements before this time have as yet done nothing in this direction. The small buyers are also placing orders a little more freely, and it is evident that stocks are very low. Prices are ruling about as follows: Open Hearth Spring Steel, 1.85¢ @ 1.90¢; Bessemer Machinery, 1.65¢ @ 1.75; Toe Calk, 1.90¢ @ 2¢; Tool Steel from 5½¢ upward, according to quality.

Bars.—It is evident that mills in the Mahoning Valley have but little hope of starting up in the near future. Within the past week one concern there has discharged its entire office force, while another has notified its employees to seek work elsewhere, owing to the uncertainty as to when they will start up. In the Pittsburgh district mills are getting a fair share of work, but some of it is taken at prices that must represent a loss. We quote Steel Bars at 1.35¢ at mill, with Bar Iron extras. This price is occasionally shaded to some extent for good orders. Bars in the Valley are held at 1.35¢, half extras, and this price is also shaded slightly for desirable orders.

Wire Nails.—The demand for Wire Nails continues fairly active, and prices are a shade firmer. For close delivery mills are obtaining $1.30 from jobbers, while to the smaller trade jobbers are charging $1.40 @ $1.45. Cut Nails are also in fair demand, and the market is represented by the quotation of $1 @ $1.05 at mills for the usual average. Through a typographical error, the quotation on Cut Nails in our issue of October 5 appeared as $1.05 on a 30¢ average. It should have read on a 50¢ average.

Barb Wire.—There is a fair demand, but with most of the mills in operation there has developed an unusually severe competition to secure business, which has weakened prices to some extent. For ordinary business we quote Four-Point Galvanized at $2.25 in carload lots, but for desirable orders this price has been slightly shaded recently. Painted is held at 40¢ less than above price in carload lots. Plain Wire we quote at $1.50 for good sized orders.

Connellsville Coke.—For the week ending Saturday, October 7, there were in the Connellsville region 5464 ovens in blast, and 12,026 idle, with a total estimated production for that week of 37,186 tons. Furnace Coke is in light demand, and is held at $1.10 in tons of 2000 pounds, f.o.b. cars in Connellsville region. Foundry Coke is quoted at $1.50 to dealers and $1.65 to consumers.

St. Louis.

(By Telegraph.)

Office of *The Iron Age*, Bank of Commerce Building, St. Louis, October 18, 1893.

Pig Iron.—Continued dullness prevails in the Iron market. Sales run from carload to 100-ton lots, and seem to grow less daily. Prices are lower and there is nothing in the immediate future to build on for any advance. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$13.00 @ $13.25
Southern Coke, No. 2 Foundry	11.50 @ 11.75
Southern Coke, No. 3 Foundry	10.75 @ 10.95
Southern Gray Forge	10.25 @ 11.50
Southern Car Wheel	17.25 @ 17.75
Lake Superior Car Wheel	16.50 @ 17.00
Ohio Softeners	16.00 @ 16.50
Missouri Charcoal, No. 1 Foundry	12.75 @ 13.25

Bar Iron.—There is very little demand either from store or mill, and while mills are running, they are not working full time. Prices are slightly

Hosted by Google

lower, as follows: Lots from mill command 1.47½¢ @ 1.50¢. Jobbers ask 1.62½¢ @ 1.67½¢ for lots from store.

Barb Wire.—Trade has fallen off somewhat since our last report. Jobbers quote Painted at $2.05 @ $2.10, while mill price in carloads to jobbers is $1.95 @ $2. Galvanized commands the usual advance. The immediate outlook is not encouraging.

Wire Nails.—The demand for Wire Nails is satisfactory, but prices cannot be called so. There are rumors of some low prices which, while not entirely substantiated, are doubtless true. Mills quote $1.45 @ $1.50 in carload lots to jobbers, which would doubtless be shaded in large quantities.

Rails and Track Supplies.—A fair amount of business is reported in this department. Prices unchanged. Steel Rails are nominally quoted at $30 @ $31. Old Iron Rails are dull at $15, but no sales are reported at this figure.

Pig Lead.—There appears to be no bottom to this metal and 3.17½¢ is now freely quoted for this month's delivery. There is no speculative interest in the market, and so far as consumers are concerned, they are only buying as their absolute needs require.

Spelter.—The market continues in the unsettled condition noted in our last report. Offerings are made at 3.25¢ @ 3.30¢, without, however, inducing any buying. Until legitimate consumption makes its appearance any advance seems out of the question.

Cincinnati.

(By Telegraph.)

Office of *The Iron Age*, Fifth and Main Sts., CINCINNATI, October 18, 1893.

There has been very little change in the general features of the Pig Iron market during the week; the transactions have been restricted to supplying the current wants of the jobbing foundries and the stove works, but the purchases of the latter are not large, seldom running over 200 tons at any one time, and frequently much less; there has been no large demand for forward delivery, and while the stronger Iron companies in the South are not urging sales, and, in fact, have withdrawn from the market, because they have sold as far ahead as they care to, yet there are indications that almost any kind of Pig Iron could be bought for spot cash about as low as it has ever sold in a regular way, although it seems certain that there is no margin of profit in its manufacture. There are so many furnaces out of blast in the South and West that with even a small increase in the demand there would soon be a scarcity of Iron, but there appears to be no prospect for such an increase in the early future, especially if the Senate does not pass the Silver Purchase Repeal bill. Quotations are as follows:

Foundry.

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke No. 1	15.00 @ 15.25
Lake Superior Coke No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Forge.

Gray Forge	9.75 @ 10.00
Mottled Coke	9.50 @ 9.75

The Mahoning Valley

YOUNGSTOWN, OHIO, October 17, 1893.

A market report when there is practically no market is something of an anomaly. No such period of dullness had ever occurred in the Mahoning Valley; business is absolutely lifeless and the controversy between the employers and the employees of the mills intensifies the situation. Not a mill in the valley is running and but two furnaces. Various attempts have been made to adjust the labor difficulties between the mill owners and the Amalgamated Association, but so far without avail. The mill owners object to signing an absolute scale running until July 1, 1894, giving as a reason that work is being done in other mills, notably at Pittsburgh, without any fixed period, and our mill owners feel that they might not be able to compete if tied up with a contract, which might be higher than others pay. There is but little business going for the mills at present, and the little work that is being done our mill owners and, of course, the workmen are losing, and the trade is gradually drifting elsewhere. A suggestion has been made that the scale be signed for a shorter term, or subject to a 60 or 90 days' notice, and this seems to meet with favor and may prove a solution of the troubles. Much ado is made by the local papers here for political effect, but this cuts no figure whatever in the minds of the proprietors. It is an expensive luxury keeping a plant idle, ranging all the way fron $300 to $500 per month for each and every mill, and the problem is being considered from a purely business standpoint, and with no reference whatever to the political outlook.

Pig Iron.—No. 1 Foundry for softening purposes is in limited demand and the little sold brings from $13 to $13.25 ℔ ton at the furnace; No. 2 grade, $12 @ $12 25. No. 1 strong Foundry is quoted at $12.50 ℔ ton at the furnace, and No. 2 $11.50. Mill Iron ranges at $11 and a shade less, delivered at the mills. A recent sale netted the furnace $10.85 and an offer of $10.75 at the furnace was refused. Southern Iron has been practically knocked out from this market. An occasional stray lot of Southern Mottled Iron is offered here, but not enough to cut any figure.

Finished Products.—Bar Iron ranges from 1.35¢ to 1.40¢ rates, and Sheet Iron 2.60¢ for No. 27 gauge. The stocks at the mills are badly broken up and it is difficult to fill orders.

Financial.

Considered as a whole there has been little or no change in the financial situation during the past week. Uncertainty remains the dominant feature. Senatorial action on the Silver Purchase Repeal bill is not appreciably nearer, and rumors of compromise still prevail, while the feeling of assurance in the ultimate triumph of unconditional repeal waxes weaker from day to day. It is true that the repeal bill is not defeated yet. There is still a chance that it may pass, but the reports from Washington are not encouraging, nor are they calculated to infuse confidence into the business community. The failure of the continuous session last week to force action on the bill had a decidedly depressing and unsettling effect in Wall street, as well as in the London market, causing a tumble in prices of stocks and bonds, with steady selling of securities on both home and foreign accounts.

The influence of the same abortive effort on the New York banks was also marked. These institutions had been, until Friday, offering freely large sums of time money on collaterals at easy rates. On that day, however, the offerings were withdrawn, as, notwithstanding the fact that the banks are amply furnished with surplus funds, they do not care to let any portion of their reserves go beyond their easy control while the fate of the repeal bill remains uncertain.

That a robust element of hope still exists in Wall street is proved by the remarkable way in which the values of securities have, on the whole, been maintained, in the face of delay and discouraging reports from Washington, continued unfavorable returns of railroad earnings and rumors of difficulties in various quarters. Although the majority of stocks on the list display a decline from the quotations of a week ago, yet the decline has been comparatively small, and nearly all securities still rule materially higher than they did a couple of months ago, showing an underlying strength that was lacking during the recent panic.

Money continues to flow into the coffers of the New York banks from the interior at the rate of nearly $1,500,000 a day. Saturday's statement of the Associated Banks showed an increase in surplus reserve of $5,267,325, bringing the amount held in excess of legal requirements up to very nearly $34,000,000. The increase in deposits during the week was $12,260,300, and the net gain in cash $8,332,400, of which $6,006,700 was specie. Loans were increased $2,374,200. To counterbalance the large inflow of money, the demand for currency from the South to move the cotton crop is beginning to be felt by the New York banks, and some heavy remittances have been made in that direction during the present week. The banks are, at the present time, rapidly canceling their Clearing House loan certificates, the amount of which outstanding in New York has been reduced to a little over $5,000,000. Outstanding Boston loan certificates are practically wiped out.

The publication of the official statement of condition of the national banks on October 3, made to the Comptroller of Currency, exhibits in a very gratifying manner the strength of those institutions, and generally shows material improvement to have been made over the conditions reported on July 12, the date of the last returns. The figures of the national banks of this city reveal remarkable strength, considering the storm and stress to which those institutions were exposed in the summer.

Deposits, which had fallen from $242,800,000 on May 4 to $218,800,000 on July 12, had risen to $227,300,000 on October 3. Loans, which were $310,700,000 on May 4 and $309,100,000 on July 12, were $283,600,000 on October 3. Specie, which was $63,900,000 on May 4 and $55,300,000 July 12, was $75,600,000 October 3. The continued depletion of the Treasury gold reserve, which has run down to $84,500,000, is causing serious consideration, on the part of the Treasury officials, of measures to build the reserve up again, and it is thought that the amount will not sink much lower.

The aggregate loss of railroad earnings on 131 roads during September was 9.77

Hosted by Google

%, as compared with 13 % in August, a reduction which does not fulfill the sanguine expectations formed previously. The roads show, too, a loss for the nine months of the year, which is almost without precedent, and which reflects most substantially the general business depression, notwithstanding an increase in passenger traffic shown by the trunk lines carrying World's Fair visitors. *Bradstreet's* reported another increase in the number of failures during last week, which are placed at 406 in the United States, against 365 in the preceding week and 191 in the corresponding week of 1892. Twenty-nine of these failures were with capital in excess of $20,000 each

On the Stock Exchange the volume of transactions has been narrow and the trading mainly of a "professional" character. Cordage stocks were in demand and strong on Thursday, owing to the announcement that the Reorganization Committee had reached an agreement with the security corporation, whereby the latter had assented to take $6,000,000 first preferred stock for an equal amount of bonds. The position of the stock was further strengthened by a rumor that the committee had at length overcome all difficulties in the way of a rehabilitation of the property, and that they would presently publish the looked for statement of the status of the company. Friday saw a sharp decline in stocks and bonds on the news of the continuous session *fiasco* at Washington. Grangers and Industrials fell from 2 to 3 points, and the majority of other securities followed suit; but the week closed with a slight recovery all round. On Monday stocks were stronger, with very light dealings. Rumors current in regard to Atchison caused a sharp drop in that stock. Tuesday's market was feverish and irregular, clearly reflecting the existing condition of financial uncertainty. "Bear" attacks caused a drop in grangers, but Reading stocks, which had been depressed in the expectation of foreclosure on the Spezer loan, rallied on rumors of a satisfactory arrangement in the matter having been arrived at. The announcement of the Union Pacific receivership on Friday had absolutely no effect on stock in the market, the event having been previously discounted. The following list exhibits the extreme fluctuations of the more active stocks during the week under review, with the closing prices on October 19:

	Highest.	Lowest.	Closing, Oct. 11.
Am. Sugar Ref.	91⅝	88¾	91⅞
Atchison, T. & S. Fé	19¼	16¾	18⅜
Balt. & Ohio	69	65⅛	65¾
Chicago Gas	60⅛	57⅞	59⅜
Chic., B. & Q.	80¾	77⅛	78¾
Chic., Mil. & St. Paul	59½	56¾	58⅛
Chic., Rock Isl. & Pac.	64¼	59¾	61½
Del., Lack & Western	157	151	155⅞
Gen. Electric	44⅜	42½	44
Lake Shore	123⅛	119¾	121
Louisville & Nashville	46	44	46
Manhattan	126	122¼	125
Missouri Pacific	22¾	20¾	22
Minnesota Iron, asked	....	....	60
National Lead, Common	26½	25¾	26¼
New York Central	102½	100	100½
N. Y., L. E. & Western	14¼	13¼	14¼
Northern Pacific, Pfd.	22	18¾	22
Philadelphia & Reading	18¼	16	17½
Richmond & West Pt., Terml	3	2⅝	2¾
St. Paul & Omaha	35¼	33	34
Union Pacific	17¾	15⅝	17½
Western Union	82⅛	80¼	82⅛

Call loans continue extremely easy. Rates have been quoted at from 1½ % to 2½ %, the last loan being at the lower figure. Business in the loan market is, however, of very limited proportions, owing to the absence of speculation on the Stock Exchange, and the supply of loanable funds is largely in excess of the demand. The absence of demand for accommodation also rules in the market for time loans, where there is an abundant supply at 3½ % @ 4 % for 60 days and 4 % @ 4½ % for three to four months, on mixed collaterals readily marketable. Commercial paper continues quiet and the demand light. A few sales have been negotiated with out of town institutions on the basis of 6 % @ 8 %, according the character of the indorsements.

Sterling exchange, which stiffened toward the close of last week on unfavorable news from Washington, has lost again this week, rates being reduced on Tuesday. The market is narrow and steady, and the supply of cotton bills fair, with small inquiry from remitters. Actual rates for sterling are quoted as follows: 60 days', $4.82¼ @ $4 83; demand, $4.84¼ @ $4.85; cables, $4.84¾ @ $4.85¼; commercial, $4.81½ @ $4 81¾. Domestic exchange on New York is quoted as follows: New Orleans, commercial 150 discount, bank par; Charleston, buying ⅛ @ 3/16 discount selling par; San Francisco, sight 17½; telegraph 27½ premium; Savannah, buying ¼ discount, selling ⅛ discount @ par; St. Louis, 90 premium; Boston, 20 @ 15 discount; Chicago, 80 to 85 premium.

Government bonds are weaker. A sale of $3000 4s coupon at 111⅜ was noted on Tuesday. Closing quotations were as follows:

	Bid.	Asked.
2s, 1891, registered	98	...
4s, registered	110¾	111⅜
4s, coupon	110¾	111½
Cur. 6s, 1895	102	.....

The railway and miscellaneous bond market has been weak and irregular, with narrow volume of business and declining prices.

Bar silver closed in London at 33¾ pence ℔ ounce, and in New York at 73¾¢ ℔ ounce. Treasury purchases on Tuesday were 142,000 ounces of silver at $0.7340 ℔ ounce. The total purchases thus far this month are 808,000 ounces. Exports of silver during the week have been heavy. Apparently India's demand for the metal has not been appreciably reduced by the recent suspension of free coinage in that country. Since January 1 London has sent more silver to India and to China than in the first nine months of 1892.

The total amount of anthracite coal sent to market during the week ending October 7 was 1,004,666 tons, an increase of 13,095 tons as compared with the corresponding week of last year. The total amount of anthracite mined thus far this year is 32,284,765 tons, an increase of 724,407 tons, as compared with the corresponding period of last year.

Metal Market.

Copper.—Exports continue liberal, and deliveries on home trade orders are fairly large. Between the two a considerable portion of the product of various concerns has been taken up, and with general trade conditions in better shape than they are at present the market would probably show stronger tone. It happens, however, that there is more than enough Copper to go around, and prices are soft in consequence, although showing no radical change. In remote instances 10¢ is quoted for Lake Superior Ingot, but there have this week been more sellers than buyers at 9¾¢, and rumor had it that sales were made at as low as 9⅝¢, net cash. Other varieties of the metal have suffered to a certain extent. Thus Electrolytic went at as low as 9¼¢, although some brands were held at ¼¢ more, while 9½¢ seems to have become top price for ordinary casting stock in round lots. It was rumored that some sales of the latter have been made at 9⅜¢ on net cash terms.

Pig Tin.—Comparatively little Tin has changed hands in a speculative way during the past week, but the market has gained somewhat in tone, although purchases by distributors and consumers have been on a rather moderate scale. The improvement, such as it is, may be attributed chiefly to the fact that the burdensome surplus of weak holders has been weeded down to narrow proportions, and that operators who control the bulk of stock have been disconcerted little, if at all, by adverse continued heavy movement of Tin from the primary sources of supply to Europe. Straits shipments during the first half of the month, it was advised, amounted to 1450 tons, including 1125 tons to Great Britain and 325 tons to the Continent, against 1275 tons during the corresponding period last year. Some few lots have been sent from Europe to this market, but not enough to have any decided influence upon the situation here. Bids were raised on Tuesday to 20.90¢, net cash, for prompt or current month delivery, but at the close of the week the buying spirit was exceedingly tame, and bids above 20.80¢ were strictly the exception.

Pig Lead.—There has been a further decline in prices and the market has had a depressed appearance. Consumers purchased indifferently, while other buyers virtually did nothing. At from 3.50¢ down to 3.30¢ probably 500 tons changed hands, with 150 @ 200 tons at the lowest figures. With Western markets quite as low, relatively, the position at the close was the reverse of encouraging. Bids of over 3.25¢ for carload lots delivered here were strictly the exception. At 3.35¢ the offering was fairly free at the close.

Spelter.—Prices for ordinary Western brands have fallen about 0.20¢, or to about 3.55¢ @ 3.60¢. This brings the cost of the metal down to an unusually low point, and, according to most calculations, leaves very little, if any, margin of profit to producers. Despite this, it does not appear that either consumers or dealers manifest any inclination to buy except as imperative wants necessitate, and exporters are not doing enough to relieve the situation. Hence a rather demoralized market and little chance of improvement in the immediate future, unless production be curtailed considerably.

Antimony.— For ordinary jobbing quantities there has been a fair demand, but the market is otherwise slow and prices are easy. We quote at 9½¢ @ 9¾¢ for Hallett's, 10¢ @ 10½¢ for L. X., and 10½¢ @ 10¾¢ for Cookson's, in round lots.

Tin Plates.—There has been a fitful demand in which ordinary Cokes shared the best, and sales to a very fair extent were made for prompt delivery and near future shipment. Prices for Cokes are quite firm, but bright Charcoals and Ternes barely hold their own. Spot quotations are as follows: Coke Tins — Penlan grade, IC, 14 x 20, $5.30; J. B. grade, do., $5.45; Bessemer full weight, $5.40; light weights, $5 for 100 lb, $4.85 @ $4.90 for 95 lb, $4.70 @

Hosted by Google

$4.75 for 90 lb. Siemens Steel scarce. Stamping Plates—Bessemer Steel, Coke finish, IC basis, $5.60; Siemens Steel, IC basis, $5.65; IX basis, $6.75 @ $7. Charcoals—Melyn grade, IC, $6.35 @ $6.37½; Crosses, $8; Allaway grade, IC, $5.60; Crosses, $6.75; Grange grade, IC, $5.75; Crosses, $6 85. Charcoal Ternes—Worcester, 14 x 20, scarce; do., 20 x 28, $11.35; M. F., 14 x 20, $7.35; do., 20 x 28, $14.75; Dean grade, 14 x 20, $5.30 @ $5.37½; do., 20 x 28, $10.50 @ $10.60; D. R. D. grade, 14 x 20, $5.15; do., 20 x 28, $10.10; Alyn, 14 x 20, $5.32½ @ $5.35; do., 20 x 28, $10.40; Wasters —S. T. P. grade, 14 x 20, $4.75; do., 20 x 28, $9; Abercarne grade, 14 x 20, $4.60; do., 20 x 28, $8.87½.

The monthly production of Copper in the United States since July, 1892, has been as follows, the first column giving the aggregate returns from the reporting mines, which include the principal Lake, Montana and Arizona producers; the second being the metal from pyrites and from a number of smaller outside sources, being estimated:

American Product.

1892.	Reporting mines. Gross tons.	Outside sources. Gross tons.	Total. Gross tons
July.....	9,294	924	10,218
August	10,807	870	11,677

New York.

Office of *The Iron Age*, 96-102 Reade street, New York, October 18, 1893.

Pig Iron.—The market continues featurelesss and exceedingly dull. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2; $12.25 @ $12.50 for Gray Forge, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft. Gray Forge is $11.25 @ $12.

Spiegeleisen and Ferromanganese.—In the imported material the market is excessively dull. The Rail mills are supplied with material for a long time to come, at the present rate of consumption, while in Ferromanganese domestic takes the whole of the trade west of the Allegheny Mountains. We quote: Foreign Spiegeleisen. nominally, for 10 % @ 12 %, $21.50 @ $22, and 20 % $25 50 @ $26, on cars, Jersey City, and Ferromanganese, $55 50 @ $56.

Billets and Rods.—The domestic Billet market is weaker, and the same is true of Wire Rods. On foreign material there is no business, and little chance of any in the near future so long as the home product is so very low. We quote nominally: Domestic Billets, $20.50 @ $22.50, and foreign Billets, $28 @ $28.50, tidewater; domestic Wire Rods, $29 @ $29.50, and foreign Rods, $39.50 @ $40, tidewater.

Steel Rails.—Business continues very light. Some conception of the condition into which the Rail mills have been forced by the bad times is afforded by the fact that in the month of September the deliveries by all the mills in the association aggregated only 32,000 tons. The normal quantity should be five times that amount. Prices are entirely nominal. It is well known that the official price of $29 was cut on a recent small order, and it is not denied that if there were any business worth fighting for buyers could get more liberal terms. The meeting of the association last week did not lead to the rupture which many predicted so confidently. No action of immediate influence upon the market was taken.

Track Material.—Small lots are selling at the following prices: Spikes, 1.80¢ @ 1.90¢; Fish Plates, 1.45¢ @ 1.60¢; Track Bolts, Square Nuts, 2.25¢ @ 2.40¢, and Hexagon Nuts, 2.40¢ @ 2.50¢, delivered. Concessions would be made for round lots.

Manufactured Iron and Steel.—No business of any consequence is coming up in this and tributary markets. We quote nominally: Beams up to 15 inch, 1.75¢ @ 2¢; 20-inch, 2¢ @ 2.25¢, for round lots; Angles, 1.75¢ @ 1.90¢; Universal Mill Plates, 1.65¢ @ 1.90¢; Tees, 2¢ @ 2.15¢; Channels, 1.80¢ @ 2¢, on dock. Steel Plates are 1.60¢ @ 1.70¢ for Tank; 1.75¢ @ 1.90¢ for Shell; 2¢ @ 2.15¢ for Flange, and 2.50¢ @ 2.80¢ for Fire Box, on dock; Refined Bars are 1.55¢ @ 1.9¢, on dock, and Common, 1.45¢ @ 1.55¢; Soft Steel Bars are 1.50¢ @ 1.70¢; Scrap Axles are quotable at 1.70¢ @ 2¢, delivered; Steel Axles, 1.70¢ @ 1.90¢, and Links and Pins, 1.70¢ @ 1.80¢; Steel Hoops, 1.75¢ @ 1.90¢, delivered; Cotton Ties, 70¢ @ 72½¢ ₰ 45 lb bundle, at mill.

Old Material.—We quote: Old Iron Rails, $13 @ $14; Old Steel Rails, $8 @ $9, and Wrought Scrap $9 @ $11.

Frank L. Fremont, 446 West street, New York, in announcing that he has made a voluntary assignment, on the 14th inst., conveys to the trade the information that he has retained his old connections with the Pencoyd Iron Works for the sale of their Beams and Structural Shapes, and has made arrangements with other mills to represent them in this market. He proposes, therefore to continue his regular mill business.

The Wellman Iron & Steel Company of Chester, Pa., have failed. A judgment for $64,000 was entered by the Delaware County National Bank of Chester, execution was issued and the sheriff has taken possession. The suit was brought on three notes, aggregating $64,000, with Richard Peters, Jr., Samuel T. Wellman and John P. Crozer, all officers of the company, as indorsers. The concern were capitalized at $1,000,000, and have over $1,500,000 invested in their plant alone.

British Iron and Metal Markets.

[*Special Cable Dispatch to The Iron Age.*]

London, Wednesday, October 18, 1893.

In the market for Pig Tin there has been very little movement. Consumers have purchased sparingly and outside speculators have held aloof in view of the large stock here and heavy shipments from the East. Prices have not varied more than 5/. At the close Straights were quoted at £78. 2/6 for prompt and £78. 12/6 for three months' futures, with the market very quiet.

Copper has also been flat, and Merchant Bars declined to £41. 10/ for prompt delivery. Warrants continue weak owing to low figures at which fine metal is being sold. Speculative interest is almost *nil* pending decision regarding the Silver question in the United States. Dealers have, however, purchased cash lots quite freely at the low prices. Toward the close of the week more interest in futures was manifested, but the demand was quickly met, and the market gave way on reports of heavy American shipments, together with selling orders from that quarter. English smelters have reduced their prices owing to keen competition from American Ingots. Prices quoted at the close were £41. 10/ for Merchant Bars, prompt delivery, £41. 17/6 for three months' futures, and £45. 5/ for Best Selected English. Spot stocks decreased 459 tons during the first half of the month, and the visible supply is made to appear 61 tons less. Chili charters were 1200 tons.

In prices of Tin Plate there has been no radical change. Demand has slightly improved, but business at the quarterly meetings was not equal to anticipations owing probably to nearness of auction sales in London and Liverpool, which seem to have had a weakening effect. Work has been suspended at the Midland Works, Morriston. Liverpool quotations are as follows:

IC Charcoal, Alloway grade.....12/9 @ 13/3
IC Bessemer Steel, Coke finish. ...11/6 @ 11/9
IC Siemens " " " .....11/9 @ 12/
IC Coke, B. V. grade, 14 x 20.....11/6 @ 11/9
Charcoal Terne, Dean grade.....11/3 @ 11/6

Pig Lead has met with slow sale and the market is weak with £9. 10/ about the best price for Soft Spanish.

Spelter continues in limited demand, and the market is flat, with sellers at £16. 15/ for ordinary Silesian.

In the market for Iron and Steel business has not improved and prices all along the line continue low and irregular. Last dealings in warrants were at 42/3 for Scotch, 34/3 @ 34/6 for Cleveland, and 44/6 for Hematite.

Hosted by Google

American Pig Iron for England.

A good deal of talk is being made over a trial shipment of 400 tons of pig iron from Anniston, Ala., to Derby, England. We believe that judgment in the significance of this should be suspended until one point has been cleared up. We sent dispatches of inquiry bearing on this point at the time of the earliest announcement of the shipment, but have not yet received a reply. The point in question is whether the iron is charcoal or coke iron. If it is the former, the matter has no significance whatever. For a good many years there have been occasional shipments of charcoal iron to England, which is used for special purposes, the quantity not exceeding a few hundred tons a year. If it so happened that this iron was sold by some furnace which had not done the business before, the transaction has formed the basis of a good deal of idiotic writing. We have had the opening of a new era burst upon us. We have begun to play once more, as we did during the last century, at making English ironmasters uncomfortable with our iron exports into their home markets, &c.

If, however, the shipment of Woodstock iron is the product of the coke furnaces at Anniston, then indeed it is curious, and indicates well the trying condition into which our iron trade has fallen. There may be some little glory in the pioneer transaction, but we fear that that is all there is in it. We trust, and in that feeling present and prospective shippers of American pig iron to England will probably join us heartily, that our own home market may soon return to its normal condition, when such high pressure outlets are not needed.

Bids for Gunboats Opened.

Bids for the construction of gunboats Nos. 7, 8 and 9, authorized at a cost of $400,000 each by the current Naval Appropriation act, were opened at the Navy Department Tuesday. The bids were as follows:

Maryland Steel Company of Baltimore.—Gunboat No. 7, $380,000; either gunboat No. 8 or No. 9, $380,000; gunboat No. 7 and either gunboat No. 8 or No. 9, $758,000; gunboats Nos. 8 and 9, $750,000; all three gunboats, $1,110,000.

John H. Dialogue & Son of Camden, N. J.—All three gunboats, $1,186,000.

Union Iron Works of San Franscisco.—Gunboat No. 7, $400,000; either gunboat No. 8 or No. 9, $385,000; gunboat No. 7, and either gunboat No. 8 or No. 9, $785,000; gunboats Nos. 8 and 9, $700,000; all three gunboats, $1,100,000.

Coronado Foundry and Machine Company of Coronado, Cal.—Gunboat No. 7, $372,000.

Bath Iron Works of Bath, Maine.—Gunboat No. 7, $425,000; either gunboat No. 8 or No. 9, $468,000.

Newport News Shipbuilding and Dry Dock Company of Newport News, Va.—Gunboat No. 7, $290,000; either gunboat No. 8 or No. 9, $306,000; gunboat No. 7 and either gunboat No. 8 or No. 9, $585,000; gunboats Nos. 8 and 9, $575,000; all three gunboats, $840,000.

All of the foregoing bids are for the construction of the vessels in accordance with plans prepared at the Navy Department. Bids for construction under plans of the bidder were submitted as follows:

Union Iron Works.—Gunboat No. 8 or No. 9, $377,000; for both, $684,000; for all three, $1,084,000.

Bath Iron Works.—Gunboat No. 7, $368,000; either No. 8 or No. 9, $382,000; gunboats Nos. 8 and 9, $754,000.

The Newport News Company are the lowest bidders in each instance.

Sheet Mill Labor Troubles.

Probably before this article gets into print a settlement will be reached between sheet mill operators and their employees. The basis of this supposition is the knowledge of the writer that members of the Amalgamated Association have begun to realize that they have been very near downfall, and they are anxious to make such concessions as will enable them to retain the good will of manufacturers and help keep the association together. The men are now taking a common sense view of the matter, which has had its origin in a desire for self protection. The handwriting on the wall told them that they would receive harsh treatment from employers in the years to come if they failed to accommodate themselves to present circumstances, and an acceptance of the 10 per cent. reduction will be the probable result of negotiations now pending. Sheet mill men have always been faithful adherents and ardent supporters of the association. If serious differences are allowed to exist between them and manufacturers, and should the majority of sheet mills become non-union, the days of the Amalgamated Association would be numbered. From information of a semi-public character it appears that the more conservative members will cast their vote and use their influence to secure an acceptance of the manufacturers' terms. Circulars asking for a vote on the subject are now in the hands of the lodges, and an early announcement of the result is expected. So far as is known at this writing, the mills having given notice of 10 per cent. reduction are: New Philadelphia Iron & Steel Company, New Philadelphia, Ohio; Ætna-Standard Iron & Steel Company, Bridgeport, Ohio, and Geo. W. Johnson, New Castle, Pa.

Trade Publications.

CRANES FOR MERCANTILE USES, as designed and built by the Industrial Works of Bay City, Mich., are illustrated and described in a catalogue just received. These include locomotive cranes of several different types and capacities, traveling and stationary jib cranes, electric overhead traveling cranes, hand power overhead travelers, pillar, transfer and jib cranes, &c. The cranes described make use of steam, electricity, power derived from shafting or that given by hand, as may be most convenient or desirable. The catalogue is handsomely illustrated with half-tone engravings and drawings of these cranes.

THE APPLETON MFG. COMPANY of Philadelphia send out a catalogue descriptive of their Challenge emery wheels and polishing machinery, to the manufacture of which a specially equipped establishment is exclusively devoted. They mention single and double, wet and dry grinding machines, universal grinding machines, cutter, surface and drill grinders and polishing and buffing machinery. Their twist drill grinder is so designed that it determines the correct angle and clearance for each individual size of drill, grinds all the lips exactly alike, and is so simple and easily operated that a boy can handle it.

JAMES SIMPSON & CO., LIMITED, of Grosvenor Road, Pimlico, London, England, have issued a catalogue, or rather book, in which they describe the Worthington pumping engines built by them and give the results of some independent tests recently made of their engines, and also describe some of their own leading designs. Although they first heard of the Worthington high duty engine in 1886 they are now pumping 501,000,000 gallons daily with this pump. The trials referred to are of great value and are as follows: Report by Professor Unwin of trial at West Middlesex Water Works, Hampton. Report by Osbert Chadwick of trial at West Middlesex Water Works, Hammersmith. Report by T. F. Parkes of trial at Lambeth Water Works, Ditton. Report by Osbert Chadwick of trial at Grand Junction Water Works, Kew. Report by Mr. Goodman of competitive trial at Grand Junction Water Works, Kew. Report by Mr. Van Ysselstein on the New Sewage Engines at Rotterdam. Report by Mr. Van Ysselstein of trial at the Westelijk, Stoomgemaal, Rotterdam.

A VERY ELABORATE ILLUSTRATED CATALOGUE on wire rope has been published by the Broderick & Bascom Rope Company of St. Louis, Mo. It is stated that in order to meet the increasing demand for their ropes they have erected a new factory which has been thoroughly equipped with the latest and most improved machinery, principally of their own design. They are enabled to manufacture rope of any size and length, up to 100 tons weight, in one continuous piece, without splicing either the strands or rope, and with absolute uniformity of lay under equal tension on each wire and without twisting the individual wires. They supply steel ropes with a guaranteed breaking strain of from 60,000 to 300,000 pounds per square inch.

WE HAVE RECEIVED from the Edward P. Allis Company of Milwaukee, Wis., a large and handsomely gotten up book which, it is stated in the introduction, is not intended either as a catalogue of machinery or as an elaborate description of their plants. It is designed to give a fair idea of the establishment and the high character of its products. To assist in this direction the following statements are made: Actual floor space in buildings, 17 acres; average number of men employed, 1500; average monthly pay roll, $75,000; approximate value of manufactured products per year, $3,000,000; average output in castings per month, 3,300,000 pounds. It is also mentioned that the establishment built the largest stationary steam plant and also the largest pumping engine in the world; first introduced in the United States the triple and quadruple expansion stationary engines, and the first triple expansion pumping engines; built the largest flour mill in the world, and introdued the roller process of flour making in American mills. The book contains many half-tone engravings of their works and of the machinery made by them.

At a meeting of the freight agents of the railroads operating between Pittsburgh and the Mahoning Valley, held in Pittsburgh last week, a reduction was made from 6 to 5½ cents per 100 pounds, in carload loads, on Iron from the Mahoning and Shenango valley points to Pittsburgh and points taking Pittsburgh rates.

D. T. Miller has succeeded John Hutzen as superintendent of the rail and blooming mills of the Edgar Thomson Steel Works, at Bessemer, Pa. Mr. Hutzen retires to take the position of boss over all the rollers—a new position recently created.

At last the gigantic forging press of the Bethlehem Iron Company, the largest and most powerful in the world, has been started. The press has been erected in the extension to the building of the famous 125-ton steam hammer. The press is rated at 14,000 tons, and is operated by 12,000 horse-power engines.

Chicago dispatches announce that J. O. Hughes of Hughes & Patterson, rolling mill proprietors, of Philadelphia, died in that city of apoplexy yesterday.

HARDWARE.

Condition of Trade.

BUSINESS on the whole shows little or no improvement during the past week. Some houses report a fairly active trade, but most jobbers and manufacturers do not give quite so favorable advices. There is certainly an important diminution in the volume of business this season as compared with last year. Seasonable goods are most active, but a good deal of complaint is made concerning the lateness of trade, which is, perhaps, explained in part by the fact that exceptionally fine weather has generally prevailed. It is not thought, however, that even in these lines the volume of business will be up to the average. Prices are, with a few exceptions, without change, but the undertone of the market is not strong, and it is expected that if present conditions continue there will be a tendency toward lower values.

Chicago.

(*By Telegraph.*)

The Shelf Hardware trade has fallen off again, very much to the discouragement of jobbers, who hoped and expected that the improvement noted last week would continue. It seems, however, to have been but a spurt with no lasting qualities. Some attribute the falling off to the very mild weather experienced during the greater part of the week, and have a slight hope that a recurrence of cold weather will again stimulate the demand. Others, however, are inclined to believe that the fall trade is now about over, and that from this time forward orders will only come in in small quantities as merchants run out of stock. The character of the trade is unchanged. Such orders as are being received are for broken lots, causing very much more than the usual trouble in packing. Western Hardware merchants continue to visit the fair in large numbers and are frequent visitors at the wholesale houses, but their visits are not attended with very much business. The Heavy Hardware trade was considerably better last week than during previous weeks. The improvement in business has been principally in the demand for Iron and Steel. It does not indicate a better condition of trade among the usual patrons of Heavy Hardware jobbers, as a considerable part of this business comes from large consumers who ordinarily buy from mills.

St. Louis.

(*By Telegraph.*)

There continues to be a steady increase of small orders and in the way of winter goods fairly good trade is expected. Retailers continue to hold back orders and buy only as their absolute needs require. Wire Nails and Barb Wire are weaker and inclined to go lower. Stove goods, such as Coal Hods, Stove Boards, Stove Pipe, &c., are generally in good demand. While staple goods are only ordered in moderate quantities, collections are in good shape and continue to improve. Jobbers are pretty generally agreed that unless the Senate shortly repeals the purchasing clause of the Sherman bill the business for the balance of the year will be gone beyond recovery. Numerous telegrams and letters have been sent urging repeal, without, however, producing any effect. Until something is done in this direction any improvement is out of the question.

New Orleans.

A. BALDWIN & CO.—The situation of business in this section of the country shows a decided improvement for the past two weeks and seems to be getting around to its natural basis, as we can readily see by the orders we are receiving from sections of the country where we did not look for an improvement for some little time.

The improvement in the movement of the cotton crop and also the early arrivals from the sugar section have brought orders and customers, who are buying more liberally than we anticipated. The holding back principle, waiting for developments, has about passed away, and they begin to realize that it is the better policy to replenish their stocks and endeavor to get some share of the business moving. The volume is not very large, but it is such a vast improvement over the past 90 days that we are inclined to feel brighter anticipations as to the future.

The late storm in this section has caused considerable demand for almost everything in the building line, and some of the stocks are becoming quite broken. Altogether the situation is certainly much brighter and more hopeful for the future than we have had for a number of months past.

St. Paul.

FARWELL, OZMUN, KIRK & CO.—The first two weeks of October have not shown the expected increase in trade over the last two weeks of September. They have held their own, however, and the month at the present rate will show a fair increase over September. We are of the opinion that had action been taken some three weeks ago by those who have the country's finances in charge the very pronounced improvement would have continued and the result have been a good fall trade. It is now, however, too late for much recovery, and we will have to be content with only a fair amount of business. The Northwest has not as yet reached that point when a business equal to that of the year before is satisfactory. It must show a marked increase to be satisfying, and failure in this regard is a disappointment. Our disappointment is greater, therefore, when we contemplate an actual falling off.

We think we are correct in placing the blame for this condition on the shoulders of those who have been sent to Washington to look after our interests. The principle that the majority must rule seems to-day to have received a severe blow and we do not know how widespread an effect it will have on future legislation. We think the proper policy to be one of extreme conservatism until something definite is known. Our present activity is largely in the direction of laying in stock for winter consumption made necessary by the present low navigation rates of freight. Collections the past week have been almost good.

Portland, Ore.

CORBETT, FAILING & ROBERTSON.—The situation in this territory has grown rather worse than better since our last. In Eastern Oregon and Washington the harvest this year, owing to a backward spring, was from three to four weeks late. The early rains have caught more than half the wheat not cut, and a large portion of the cut not threshed. The farmers and warehousemen have been accustomed to stacking the sacked grain on platforms heretofore, as a little snow would not damage it. The rain has so soaked the sacks that they are now bursting, and liable to sprout the wheat. The damage to wheat, as now reported, will amount to a large sum, and, coming in addition to the low prices, will make collections very hard.

Omaha.

LEE-CLARKE-ANDREESEN HARDWARE COMPANY.—Business has gradually assumed fairly large proportions, and now appears to have settled down to a steady thing. When business has about reached its normal condition, an improvement can hardly be expected every week, but it is enough to ask that it hold its own. The present volume is as large as could be reasonably expected under the conditions prevailing in the country, though taking it as a whole it is not on a par with what it was this time a year ago. Comparing the present season with two years ago, no occasion

Hosted by Google

will be found for fault finding with the present volume of business. It has been our opinion right along that the West would recuperate from the recent financial upheaval sooner than the East. Business in this part of the country is dependent more upon the farmers than upon the manufacturers, and fortunately the farmers have fair crops and are in a satisfactory financial condition. The products of the soil are sufficiently abundant and the market good enough to insure a fair amount of money in general circulation, and hence a reasonably good business in both a wholesale and retail way may be looked for.

Louisville.

W. B. BELKNAP & Co.—Business is increasing somewhat in volume; that is to say, orders are a little more numerous and decidedly larger individually. The country is so bare of goods that the natural wear and tear of consumption calls for a good deal of material to replace that which is worn out, even if there were not a single new project in sight.

Some articles on the list are strong and not in overabundant supply, such as Sheet Iron, which is firm at an advance of $1 or $2 over the lowest price reached during the summer.

Bar Iron, too, has a little backbone, but this is due largely to the fact that so many of the mills are shut down and stocks broken. With anything like production on the usual scale there would be a greatly overstocked market and consequent demoralization.

There is a better demand for Wire and Wire Nails, but prices so far on these articles have shown no recovery.

The continued cheapening of the raw material, Pig Iron, Steel Billets, &c., is likely to prevent any marked advances.

Ammunition and Loaded Shells are particularly scarce. Factories are evidently far behind their orders on these goods, and no matter if business is dull it is evident that the sportsmen will take to the woods as usual this season.

Game is rather abundant, and hunting is as near military service as many of the great army of unemployed want.

The dilatory tactics in the Senate are disgusting the people here. The reproach of Wall street—viz., excess of wealth—can scarcely fall on us, but we seem as helpless as the rest of the country to bring about anything better. One of our Senators, Lindsay, has done his best (and that is very good), but the obstructionist is a much harder man to deal with than the reformer.

Baltimore.

CARLIN & FULTON.—Trade, like the season, is in the "sere and yellow leaf," and though according to the calendar the autumn has but partly gone, yet from a business point of view the fall is almost over.

How the bright hopes of a country, based upon expected intelligent legislation, upon abundant harvests, upon a dearth of goods, upon a desire for trade, have been realized can be best answered by the ledger of every manufacturer and merchant throughout the land, by the idle mechanics in our streets, by the impoverished farmers, and the diminished incomes of widows and orphans.

The child at school should have another page added to his history, recording the shameful fact that in the Senate of the United States are to-day men sworn to perform their duty to the Constitution and laws of this whole country, who, deaf to all appeals for patriotic action, to all petitions and remonstrances which have been sent from one end of the country to the other, deliberately defy public opinion and through a strained and ridiculous pretense of Senatorial courtesy, insult the sober common sense of the whole nation.

The idea that in the chief legislative body of this country no question at issue can be brought to the test of a vote, while there is a minority, no matter how small, to object, is simply preposterous. This is a matter involving the greatest interests of this Republic, and while to-day it is a question of silver, to-morrow it may be anything else; and if the supposed local interests and influence of one small section can dominate and dictate to every other section as it sees fit, the House of Representatives may as well spare itself the trouble of framing any tariff bill, unless they give the Republican party credit for more forbearance and forgetfulness than has ever been accorded them heretofore.

Without discussing the effects of a revision of the tariff by the present Congress, whether for good or bad, we do not believe from the present condition of affairs that the trade throughout the country need consider it at all, for if the silver bill cannot be repealed by a majority which exists in the Senate, a tariff bill cannot be passed with the majority uncertain.

It is almost useless to talk about prices; they have been well sustained for the reason that there has been no room for reduction and preduction has been limited by the factories either remaining idle or running upon half time.

Collections have improved somewhat, but we must remember that obligations, the result of purchases, have been remarkably small.

The responsibility for the future improvement of trade rests upon the Senate of the United States, and we wait upon it.

Boston.

BIGELOW & DOWSE.—This market is without change. Prices are being maintained and the volume of business doing is a slight improvement over the past month; but there is considerable falling off if compared with last year.

Everything is done on a very conservative basis. Stocks are being replenished only to complete assortments. Every one is waiting for Congress to do something that will establish confidence. Until such time as they choose to act the merchant must wait While they are waiting they are thinking how little interest politicians take in the welfare of the country, and if the time is not fast approaching when the merchants will come to the front and insist upon their right to a larger representation in the national Congress.

At a meeting of the Boston Iron and Hardware Club, the past week, the name was changed to the "New England Iron and Hardware Club." The membership is rapidly increasing and every wholesale dealer throughout New England, every Hardware and Iron house in Portland, Maine, are now members. The meetings thus far have been very satisfactory and promise good results.

All the dealers in Manchester and Concord, N. H., have joined the case and carting agreement, to take effect November 1.

Cleveland.

THE W. BINGHAM COMPANY.—Trade since our last has shown a slight improvement, but is still behind that of last year at this time. All orders contain more or less seasonable goods and are evidently very carefully made up. The demand for Wire and Nails has fallen off and prices are correspondingly weak. City retailers report trade as slightly improved, as many factories that have been closed entirely are starting up on half or three-quarter time. Money is somewhat easier and collections are fair.

Philadelphia.

SUPPLEE HARDWARE COMPANY.—Investigation into the results of the jobbing Hardware houses in our city during the last two weeks shows trade has gradually moved from the low valley of depression to higher ground, where it remains, and although not likely to reach the summit of successful trade at one bound a gradual further ascent is anticipated.

There are many reasons why the sale of Hardware should be above the level of many other kinds of merchandise, although now persons in that line are slow to engage in new enterprises; but work already begun in building operations will likely be completed, consequently Hardware in that line will be required during the fall; besides, mechanics with employment must have the necessary tools and worn out Agricultural Implements will be replaced. These are quite as necessary as the paper upon which our daily or weekly press is printed.

Insufficient supply of funds in the vaults of our banks and trust companies no longer obstructs the channel of trade. Banks now far exceed their reserve limit and have a large surplus beyond.

There are several reasons for this being the case. First, country banks, instead of being large debtors, now show credit balances. Currency has been unlocked from private vaults and released from hiding places, and many of the manufacturing industries, especially in our own city, being either closed or working on partial time only, having gradually made collections of outstanding accounts, and not using them as heretofore for their weekly pay rolls, this money remains in bank on call until the prospect for trade brightens sufficiently to guarantee resumption of their factories. But the financial scare has largely abated.

The increase in deposits in the banks of New York, Boston and Philadelphia of nearly $40,000,000 and the reduction of the combined clearing house certificates of those three cities of about $40,000,000 within a limited period naturally makes a great difference in the financial condition, and this showing has astonished many of those who have asserted there was insufficient money for business purposes.

The present circulation shows over $25 *per capita*, which is greater *per capita* than any country outside of France, and at the present time, for present requirements, with diminished trade in manufacturing, really more than actually required, for the present

Hosted by Google

reduction of trade is estimated to be not far from $100,000,000 per month from enforced idleness.

There has been considerable complaint that, notwithstanding this large increase of surplus, the banks still refuse to loan their funds other than in the most conservative manner. There is, however, good and sufficient reason for this. They naturally desire to feel fully secure in their loans and discounts, and when they look upon the large number of industrial and mercantile failures throughout the country during the last three months, a conservative policy seems to them necessary; besides stocks, offered as collateral, as yet show no guarantee of stability.

Collections, as well as trade, have improved, although the former not to the extent desired, nor to the extent necessary for requirements of those who have been so leniently disposed toward those who still have accounts unpaid.

The improved monetary conditions of banking institutions throughout the country, regardless of the continued struggle in the Senate over the repeal of the silver purchasing clause, show conclusively that that law was not the sole cause of our financial embarrassment. Had it been, the financial conditions which existed in May and June would have grown more severe with each succeeding monthly purchase, and would have been aggravated by the continued agitation and increased uncertainty of its repeal (without some compromise being coupled with its passage.)

We intimated in an article in *The Iron Age* as early as August 3 that the reduction of the Government surplus was the chief and important factor of our financial troubles. Perhaps the greatest financial error President Cleveland ever made was during his former administration when he advocated the reduction of the Government surplus in order to save a small amount of interest. Although a mistake in theory, it became a popular cry, which both political parties adopted.

Popular opinion is usually correct after due consideration, but popular opinion is frequently impulsive in its demands before the facts and results are properly understood of what might be the natural results of reduction in case of decreased exports and increased importation, or a sudden call upon us from abroad for gold.

The seductive reason given for the surplus reduction was the saving of a few million dollars in interest, say three per cent. on $150,000,000, or, net, $4,500,000 per annum. While that effort in itself was commendable, but in the effort to save this sum (small in comparison with our expenditures) it was a mistaken policy, through which our country has lost hundreds of millions through failures and enforced idleness, and to-day we are compelled to look upon the humilitating spectacle of having encroached upon the $100,000,000 reserve, which has been reduced to but a little over $86,000,000, or ten per cent. on the dollar of our outstanding demand liabilities, with probably a continued decrease, owing to the monthly expenditures in excess of receipts.

It is simply impossible to continue in good credit at home or abroad with this absurd surplus, and provision must be made at an early date to have it restored. If this is not done we are liable at any time to undergo a repetition of our present financial troubles.

The Bank of England, which is looked upon world wide as an institution worthy of example, holds in reserve from 48 to 50 per cent. of outstanding indebtedness, and our own national banks of central reserve cities—*i. e.*, New York, Chicago and St. Louis—are compelled by an Act of Congress to hold 25 per cent of reserve, in addition to which they hold, as further security, discounted bills receivable usually to two-thirds of their deposits, which at ordinary times can, if necessary, be rediscounted through other banking institutions in case of immediate want.

Neither banking institutions, manufacturers nor jobbers, who conduct their business with intelligence, would ever risk their credit on such small and unsafe reserve as our Government adopted. It was this small reserve surplus in the vaults of the United States Treasury (it was then $106,000,000 free gold) which caused foreign distrust of our ability to continue gold payments, and hence flooding our market with securities to be redeemed. It was not alone our paying out $3,000,000 per month. This amount alone was small in comparison to the large drain that was being made upon us from the fact that balance of trade was against us.

President Cleveland doubtless realized the mistaken theory of our surplus reduction; indeed, tacitly admitted it in his special message calling Congress together, and deserves very great credit for the patriotic manner in which he presented the case before Congress. "A wise man is always open to conviction. Fools only never change their opinion." He is known to be eminently sound on financial questions, and especially sensitive regarding our financial national credit.

In 1879, when the Secretary of Treasury, John Sherman, resumed specie payments, the cash in the Treasury was $382,450,695.96, and the Government receipts beyond expenditure were then sufficient to accumulate an additional surplus at the rate of $20,000,000 each fiscal year, with our demand liabilities not far from one-half of the present outstanding demand liabilities.

At that time there were some pessimists who doubted the Government's ability to sustain specie payments, yet this same element now advocate a monthly increase of indebtedness when we hold but 10 per cent. in gold to pay present indebtedness.

It is therefore no wonder that foreign nations were uneasy early in the season when the balance of trade was so many millions against us and sold our securities. Indeed, there were some predictions that $50,000,000 of silver certificates might be collected on foreign account and gold demanded for the same. What a sweep that would have been against our Government surplus; but owing to the fortunate circumstances of our having wheat, corn and cotton to export, coupled with the fact that foreign nations no longer required gold to further increase their reserve, the finances of our country have been able to recuperate.

The necessity of the repeal of the law compelling us to call upon our already depleted treasury for gold each month to buy silver we do not need daily grows more important, especially as our surplus is being daily reduced, and the Senate has not yet shown itself competent to master the situation.

It was intimated early in the present session by men of experience that the prospects were not bright for the repeal of this law, basing their opinion on the fact that both President Harrison and President Cleveland, before he was elected, favored the repeal of this law at the last session of Congress.

It is now known that there has been quite an undercurrent unfavorable to repeal of Senators who desired to be looked upon as favorably inclined toward the President, but who are free coinage men at heart, and assume a desire for repeal which does not exist, and who have no desire to reach a vote without something else equally favorable could be tacked on to the measure.

The delay affords an opportunity for some of the so-called majority (who profess to favor the law) to defeat it, unless a compromise is effected.

We are at the present time suffering less from the silver purchasing clause than we are from expending beyond our receipts, as the construction placed upon the indefiniteness of the law by Secretary Carlisle affords him the opportunity to purchase only that amount of silver at a price designated by him, based on London quotations at the time his offer was made.

There is no question that President Cleveland has the power to add to the gold reserve by selling bonds so far as is necessary to retain either the Government credit or the $100,000,000 surplus, but as both he and Secretary Carlisle oppose that measure and refused the offer made early in April by New York bankers, they naturally prefer waiting for some action of Congress advising the sale of bonds to increase our Treasury surplus, which undoubtedly must be done at an early date if we desire to sustain our national credit.

Notes on Prices.

Wire Nails.—The Wire Nail market is in about the same condition as for the past week or two, and without evident improvement. There is, however, perhaps a slight increase in the demand, but orders are not placed with any freedom. Prices are substantially as at our last report—namely, $1.30 for carload lots at mill. This quotation is quite general, and is but slightly shaded in exceptional cases, so that anything below this figure may be regarded as somewhat under the market. Some business is being done in anticipation of an early closing of navigation, but this fact has not as much effect as usual, inasmuch as the trade are very conservative in their purchases, and even the low prices ruling are not sufficient inducement to secure the placing of liberal orders.

Chicago, by Telegraph.—Manufacturers of Wire Nails report a considerably better inquiry and numerous sales of round lots. Quite a number of jobbers through the Northwest have realized the fact that navigation will close within the coming month and are now placing contracts in order to receive stock at the low freight rates prevailing by the water routes. The demand is also based to some extent on the very low prices ruling for Wire Nails and the belief that they are selling either at or below cost. They reason that this will compel a heavy curtailment of production in the near future and that it may possibly be followed by an advance in price. The inquiries and sales are for the most part for the month of November, but in some cases cover the whole period in-

Hosted by Google

tervening to the close of the year. There are some buyers who would like to contract at present prices for shipments running into next year, but manufacturers are not willing to make such terms. Prices on factory lots are still quoted at $1.40 to $1.45, Chicago, but these rates have been shaded on the largest quantities sold. Small lots from stock are quoted in a regular way at $1.55, but a large part of the trade is done on the basis of $1.50.

Cut Nails.—The volume of business in Cut Nails is light, but there has been no weakening in prices. The Eastern market is represented by the quotation of $1 base on carload lots at mill and manufacturers are indisposed to make concessions, except in special cases. There are indications of a disposition on the part of Western mills to strengthen their prices somewhat, and in some cases extreme quotations have been withdrawn. As a result of this condition some of their most recent quotations name a slightly higher base or require a better average. This is not regarded as indicating the probability of an advance or any radical improvement in the tone of the market, but is rather a result of the conservative disposition on the part of the mills, who desire to obtain more remunerative prices. Small lots from store in New York are quoted at $1.25 to $1 30.

Chicago, by Telegraph.—The Cut Steel Nail trade is hardly in as active condition as the Wire Nail trade. Orders are still confined to small quantities, on which manufacturers continue to quote $1.20 @ $1.25. Jobbers quote small lots from stock at $1.30.

Barb Wire.—The Barb Wire market continues weak and there is only a moderate volume of business. Manufacturers are desirous of securing orders and are going to the relatively small trade to a larger extent than usual, their business with the jobbers being this season comparatively light. Quotations are on a basis of $2.25 to $2.30 for Four-Point Galvanized, at mill, but these figures are sometimes slightly shaded. Painted is held regularly at 40 cents less.

Chicago, by Telegraph.—The Barb Wire business shows no improvement. Manufacturers are sending out their travelers and endeavoring to secure what trade they can, but reports thus far are not encouraging. Jobbers are doing very little in this branch of trade, and state that such business as is going is still handled almost entirely by manufacturers. Quotations are repeated on carload lots of ordinary Galvanized Barb Wire at $2.40 and Glidden at $2.50. Less than carload lots of ordinary Galvanized are quoted at $2.55.

Hardware Shelf Boxes.—We give below the price-list of A. H. Green, successor to S. H. Green, 22 Park place, New York, covering the line of Lock Corner Wood Boxes which he is manufacturing for the trade. These Boxes, it will be observed, are made so as to be interchangeable. The sizes given below are outside measurement and without covers. The list is as follows, subject to a discount of 50 per cent.:

No.	Long.		Wide.		High.	Each.
1.....	10½	x	3	x	3⅛.....	$0.07
2.....	10½	x	4½	x	3⅛.....	.08
3.....	10½	x	6	x	3⅛.....	.09
4.....	10½	x	9	x	3⅛.....	.13
5.....	10½	x	12	x	3⅛.....	.16
7.....	10½	x	18	x	3⅛.....	.24
22.....	10½	x	4½	x	7	.11
23.....	10½	x	6	x	7	.14
24.....	10½	x	9	x	7	.18
25.....	10½	x	12	x	7	.24

To parties fitting up with new shelving Mr. Green suggests that if each division is made 36 inches wide, 7 inches between shelves and 10½ inches front to back, these boxes will completely fill them, either of one size or a variety of sizes in the same shelf. All the above sizes are carried in stock. Special sizes are also made to order in quantities of 50 and upward of a size.

A Screw case containing 80 drawers, furnished with chestnut knobs, is also made, the price being $7.50 each, net. The size of the case is as follows: 29½ inches high, 25½ inches wide and 8¼ inches front to back. Each drawer is intended to hold at least 1 gross of Screws.

Clippers.—Coates Clipper Mfg. Company, Worcester, Mass., whose Improved Barbers' Clippers were illustrated in a recent issue, are selling their Horse and Barbers' Hair Clippers from the following list, which is subject to a discount to the trade of 25 per cent.:

No.	Each.
2, One-hand Fetlock Animal Clipper.	$2.00
4, Flat Spring Standard Toilet "	2.50
6, Spring Adjustable Toilet "	3.50
7, " Razor Toilet Clipper.	2.50
9, Two-hand Fetlock " . .	2.25
19, " Newmarket pattern Clipper	2.00
24, Adjustable Spring Bent Clipper....	3.00
27, " " " Razor Clipper.....	3.00
29, Hand-Power Horse Clipper...	50.00
31, Adjustable Spring Toilet Clipper..	2.50

Stove Truck.—The Lock Frame Stove Truck, manufactured by Randall & Ward, Le Roy, N. Y., and described in a recent issue, is sold to the trade at $15 per dozen for the wood and $18 per dozen for the steel.

Sheet Zinc.—The market for Sheet Zinc continues without change. The exceptionally low prices which are now ruling are due principally to the low price of Spelter and the inactivity of both the Spelter and Sheet Zinc markets. The demand for Sheet Zinc is, however, somewhat stimulated by the reduced prices which are now prevailing, but the trade are not disposed to purchase much beyond their early requirements.

Cordage.—Within the past week there has been no quotable change in the price of Cordage, but the market is weak, and somewhat lower quotations can be obtained in special cases.

Glass.—Interest centers in the wage question rather than in the unchanged condition of the Glass market. It is reported that the Indiana Window Glass manufacturers representing 540 pots ask the Wage Committee to demand a greater reduction in wages than was asked by the committee at the last conference. This action was taken in view of the continued depression and unsatisfactory outlook for business, and the further decline in the price of imported Glass. Pittsburgh, Pa,, manufacturers are represented as being prepared to stand by the Indiana Glass manufacturers in demanding a further reduction of wages. At the present time it is understood that there are something like 120 pots in operation throughout the country, but that none of these factories are members of the National Window Glass Association. Jobbers report the demand about the same, orders being for small quantities, and that orders are filled with imported Glass when American Glass of the desired sizes cannot be obtained. Grinders and polishers are at work on rough Plate Glass in manufacturers' hands to supply the demand, and there seems a probability of Plate Glass factories starting up before the first of the year. Quotations on all kinds of Glass are unchanged.

Export Notes.

THOMAS COOPER is now in charge of the Sydney and Melbourne offices of the Geo. F. Eberhard Company, having arrived out at Sydney July 21. Mr. Cooper has long been in the Australian trade, acting for a well known house in the colonies, but coming to Chicago on account of the exposition went back as one of the representatives of the Eberhard Company. He reports trade in somewhat better condition, and orders received by the New York branch through commission houses here indicate he is stimulating business to a satisfactory extent.

James E. Halsey, one of the oldest Hardwaremen in New York, sailed for Europe October 16 as the representative of Chas. B. Rouss on an extended trip through England, Germany, Sweden and Switzerland on business connected with the above concern.

E. Ahuja, one of the partners of Browne, Beeche & Co., Valparaiso, has returned to Chili. The above concern is but another name for the well-known house in this city of Hemenway & Browne, who are among the best known

Hosted by Google

drawers of South American exchange on Europe, having exported goods to the West Coast since 1829, largely on their own regular line of vessels.

Standard Axe & Tool Works, Ridgway, Pa., are now represented in New York, Boston, Philadelphia, Pacific Coast and for export trade by Geo. F. Eberhard Company, 64 William street, New York. One grade of their Axes is known as the Black Eagle Brand, made of steel refined by a special chemical process. In addition to this brand a line of other Axes is made by the Standard Works.

New York merchants doing business with Australia refer to the last mail from that country as more satisfactory than those which have preceded it for some time, and look for even better results in the mail to arrive. Houses here supplying goods for Cuban consumption advise us of a considerable slacking off in trade with the Antilles; that while doing something all the time there is less snap to business than earlier in the year.

The Transvaal South African gold output steadily increases month by month, that for August, 1893, being 136,069 ounces as officially announced. The 1892 output was 1,250,000 ounces. With gold at $16 per ounce this is a handsome export item of itself. Recently some 350 miners from Australia have arrived in two bodies; the influx of population from all sources continues to increase at a rapid rate; one raiload to the coast was completed in 1892 and two others will be completed in 1894.

World's Fair Awards.

The awards in Group 119, manufactures, including Vaults, Safes, Hardware, Edge Tools and Cutlery, are as follows:

Illinois—Chicago—William D. Gibson, Springs; Knickerbocker Ice Company, Ice Cutting and Distributing Tools: Chicago Spring Butt Company, Spring Hinges and Butts, Sliding Door Hinges; Wolf, Sayer & Heller, dried beef Cutters.

Pennsylvania — Philadelphia — McCaffrey File Company, Files and Rasps; Miller Lock Company, five awards, Padlocks, keyless Cabinet Locks, Night Latches, keyless Cabinet and Post Office Box Locks, Padlocks for railroad switches; Fayette R. Plumb, four awards, Edge Tools, Hammers, Sledges, Railroad, Miners' and Blacksmiths' Tools; Henry Disston & Sons, 31 awards, Files of every description for every purpose, Cross-Cut Saws, Hand Saws, Back Saws, Butcher Saws, Plumber Saws, Buck Saws, Hack or Machinist Saws, Pruning Saws, Compass Saws, Keyhole Saws, Plasterers' Trowels, Bricklayers' Trowels and tools, Carpenters' Squares, Carpenters' Bevels, Carpenters' Gauges, Spirit Levels, Machinists' Straight Edges, Machinists' Squares, Machinists' Rules, Wire Gauges, tools for keeping Saws in order, Saw Sets, Trammels, Hammers and Swage Bars, Straight Edges, Anvils, Gummers, Cane Knives, Post Hole Diggers, Screw Drivers.

Massachusetts—Boston—Atlas Tack Corporation, Tacks and Brads; Blount Mfg. Company, three awards, Door Checks, Springs and Stops, Sash Locks; Norton Door Check & Spring Company, automatic Door Checks and Springs; Simonds Mfg. Company, Fitchburg, three awards, Crescent ground Cross Cut Saw, Saw Sets; Barney & Berry, Springfield, Ice and Roller Skates; Northfield Knife Company, Northfield, Pocket Cutlery; Oliver Ames & Sons' Corporation, North Easton, four awards, Shovels, Spades, Scoops, Drainage Tools; Washburn & Moen Mfg. Company, Worcester, Builders' Hardware; J R. Torrey Razor Company, Worcester, Razors; J. S. Thompson Mfg. Company, Waltham, Rivets for Shoe, Harness, Trunks, &c.; Charles Buck, Millbury, Edge Tools; Buck Bros., Millbury, Light Edge Tools, Chisels; Coburn Trolley Track Mfg. Company, Holyoke, Parlor, Barn and Fire Door Hangings; Snell Mfg. Company, Fiskdale, Boring Tools.

Rhode Island—Providence—American Screw Company, Wood and Machine Screws, Bolts and Rivets; Nicholson File Company, Files and Rasps, Filers' Specialties; Rhode Island Tool Company, four awards, Nuts, Wrenches, Turn Buckles, Drop Forging.

Connecticut—Russell & Erwin Mfg. Company, New Britain, four awards, Builders' Hardware, House Furnishing Goods, Screws, Bolts, Nails and Carpenter Tools; Eagle Lock Company, Terryville, Locks; G. J. Capewell, Hartford, three awards, combined Hammer and Nail Puller, improved Nail Puller, combined Hammer and Nail Puller; Hobart B. Ives & Co., New Haven, Sash Locks; Stanley Rule & Level Company, New Britain, Carpenters' Tools; Stanley Works, New Britain, Builders' Hardware.

New York—New York City—James Bardsley, Spring Hinges and Door Knobs; C. E. Jennings & Co., six awards, Augers, Bits, Drawing Knives, Saws, Planes, Carpenters' Tools; Kearney & Foot Company, Files and Rasps. Brooklyn—Bommer Bros., Spiral Spring Hinges; Wilson Bohannon, five awards, Locks, Padlocks, Switch Locks, Door Locks, Handles and Night Latches; N. Stafford, Stafford Coin Registering Bank.

Ohio—Cincinnati Tool Company, Cincinnati, Tools; Geneva Tool Company, Geneva, Hand, Farming and Garden Tools; Smith & Buckingham, Mount Vernon, Umbrella Locks; the Christy Knife Company, Fremont, Bread, Carving, Cake and Paring Knives; Clauss Shear Company, Fremont, three awards, Shears, Scissors, Bread, Cake and Paring Knives and Carvers; Van Wagoner & Williams Company, Cleveland, double and single Spring Hinges.

Other States—Withington & Cooley Mfg. Company, Jackson, Mich., Farm and Garden Tools; J. C. White, Waseca, Minn., Nail counter; E. T. Barnum, Detroit, Mich., Cheese Safes, Jail Cells; Stover Mfg. Company, Freeport, Ill., five awards, book holders, Hinges, Sash Pulleys and Locks, dictionary and book holders, double-acting Spring Hinges; J. H. Sternbergh & Son, Reading, Pa., five awards, Bolts, Rivets, Nuts, Washers, Screws; E. C. Atkins & Co., Indianapolis, Ind., three awards, Cross Cut Saws, Hand Saws, miscellaneous Saw Tools; Severance Nail Machinery Company, St. Paul, Minn., Nails and Spikes; Josiah J. Deal, Canton, Ohio, Combination Locks; C. S. Osborne & Co., Newark, N. J., Hammers, Plumbers' and Saddlers' Tools; David Maydole Hammer Company, Norwich, N.Y., Hammers; L. A. Baker & Co., Elgin, Ill., Shingle Nail Machine; William Rose & Bros., Sharon Hill, Pa., Mechanics' Tools; De Mars Sash Lock Company, Albuquerque, Minn., Sash Locks; Grand Rapids Brass Company, Grand Rapids, Mich, Furniture Trimmings; Iowa Farming Tool Company, Fort Madison, Iowa, Hand Farming Tools, Hoes, Rakes and Forks; Lynch Mfg. Company, Madison, Wis., Lock Buckles; Hatch Cutlery Company, Milwaukee, Wis., Shears, Scissors, Pocket Cutlery and Knives.

In Group 117, Department of Manufactures, which covers Wire Goods and Screens, Perforated Sheets, Lattice Work, Fencing, &c., the following awards are announced:

Massachusetts—Clinton—Clinton Wire Cloth Company, five awards, Wire Cloth, Fancy and Galvanized Wire, Wire Nettings, Fencing, Wire Lath; Translucent Fabric Company, Translucent Fabrics, Transoms; Washburn & Moen Mfg. Company, Worcester, flat Steel Springs, round, angular and convex Card Wires, round Wire Springs.

Illinois—Chicago—N. P. Wilson, Horseshoes; United States Wire Mat Company, Decatur, Ill., Galvanized and Brass Wire Mats and Matting.

New Jersey—Trenton—Trenton Iron Company, three awards, Iron and Steel Wire, Telephone and Telegraph Wire, Spring Weaving Transparent Steel and Music Wire; New Jersey Wire Cloth Company, three awards, Wire Lath, Floor, Ceiling; John A. Roebling's Sons Company, Wire Rope, Cloth.

New York—Tiffany Glass & Decorating Company, New York, Glass and Metal Lath Work for windows, &c.

Ohio—The Baackes Wire Nail Company, Cleveland, Steel Billets; the Jones National Fence Company, Columbus, Wire Fencing.

Connecticut—Gilbert & Bennett Mfg. Company, Georgetown, Wire Cloth, Fencing and Fire Proofing.

Michigan—E. T. Barnum, Detroit, Wire and Iron Fences.

Maine—E. T. Burrowes & Co., Portland, Wire Window Screens, Screen Doors.

New England Iron and Hardware Association.

THE REGULAR MEETING of the Boston Iron and Hardware Club was held Tuesday, October 10. It was decided to change the name of the club to the New England Iron and Hardware Association. The meeting was a pleasant and successful one, and the work of the association is progressing very satisfactorily. The credit bureau is referred to as working well, and gratification is also expressed that the case and cartage agreement is being carried into effect without serious difficulty and with but little opposition from the retailers.

WILLIAM H. QUINN of W. H. Quinn & Co., 103 Chambers street, New York, was nominated for State Senator by the Republican Senatorial Convention, which met October 16 in Brooklyn. Mr. Quinn is well known as the New York representative of several leading Hardware manufacturers, and is a member of the Hardware Club.

Hosted by Google

Trade Items.

GEORGE M. EDDY & CO., 345 to 353 Classon avenue, Brooklyn, N. Y., have a very complete display of Tape Measures in the northeast gallery, Column E, of the Manufactures Building, at the World's Fair. The exhibit is arranged in a handsomely furnished cherry showcase, and comprises a great variety of winding Tapes and spring Tapes of many sizes and in metal and leather cases, elegantly finished. The also exhibit Steel Tapes, loose Tapes of many kinds, Tailors' Measures, &c.

C. H. TUCKER, JR, agent, 114 liberty street, New York, is representing as heretofore the entire line of goods made by the Wiley & Russell Mfg. Company, Greenfield, Mass., including Taps, Screw Plates, Tap Wrenches, Punches, Reamers, Mandrels, Swage Blocks, Tire Shrinkers, Drilling Machines, hand and power Bolt Cutters, &c. A full stock of these goods is carried by Mr. Tucker, who refers to this practice as having in the past brought him much business, owing to the promptness with which the goods can be supplied.

S. S. RASER, 40 North Sixth street, Philadelphia, announces, October 2, that he has purchased the entire Key stock of the late Geo. W. Pierce Company, and has removed it to his store, where he will carry on that line in connection with his present business. Mr. Raser states that he will be prepared to furnish many special Keys not usually found in stock. He is also equipping a plant for the manufacture of these goods. Mr. Raser will continue to handle Dog Collars and Muzzles, Roller and Ice Skates, Bicycle Sundries, Iron Toys, Silver Plated Ware, &c.

MERIDEN BRONZE COMPANY, 30 Park Place, New York, have lately supplemented their assortment of fine Lamps which are now offered for this fall's trade by the addition of a line of high-grade banquet Lamps, with cut and decorated Venetian glass columns, both in crystal and different shades of green. The metal parts are gold plated. The Venetian glass portion has been brought here on importation orders and this company, we are told, were granted the exclusive privilege of mounting these particular designs. There is also on exhibition a number of examples of fine decorated Japanese Pottery, mounted in solid brass, both plain and gold plated. This ware can be had incorporated in either banquet or piano Lamps.

ATTENTION IS DIRECTED to an advertisement in this issue of P. & F. Corbin, New Britain, Conn., and New York, in which liquid Door Checks and Springs are shown. For these goods the manufacturers claim easy adjustment, adaptability to all requirements, attractive appearance, satisfactory action and durability. The submersion of the Springs in lubricant is referred to as diminishing the friction incident to Springs when working against each other in a dry state. The lubricant thus adds to the efficiency of the device and to the ease with which doors are opened and closed upon which the Checks and Springs are used.

WILEY & RUSSELL MFG. COMPANY, Greenfield, Mass., have enlarged their line of full mounted Lightning Screw Plates by the addition of a number of sets. These goods are put up in hinged wooden boxes in sets of five to nine sizes, with a stock to each die. The dies run in size from ¼ to 1 inch, with corresponding taps included in each set, five sets being put up in this manner. Each die is fitted permanently and rigidly in its own stock, with adjustment for wear or to make bolts fit tight or loose, permitting of the die wanted being at once available; and also allows every die in the set to be used at the same time, if necessary. Another feature of this arrangement is that every stock is proportioned to the strain likely to be put upon it, suited to the die it holds. These goods, we are advised, are offered at approximately 10 per cent. less than the former style, and that the quality of the die is the same. C. H. Tucker, Jr., 114 Liberty street, New York, as agent, carries these goods in stock.

JOHN J. WIRTNER, secretary of the Geo. F. Eberhard Company, is here from San Francisco, getting posted on new goods for the present season and visiting some of the factories represented by his company. Incidentally he visited the Chicago Exposition on his way East.

H. D. HULL, dealer in Hardware, Troy, N. Y., has doubled the size of his store since it was damaged by fire in July, 1892, and is adding some lines of goods not carried before.

W. R WALKLEY, New York manager of Peck, Stow & Wilcox Company, addressed the Hardware dealers at their dinner given October 11 in the United States Hotel, Boston. He spoke nearly an hour to about 65 people, among other things calling attention to the responsibility resting on the young men of this country during the next decade, not omitting to incorporate in his remarks some of his poetry prepared for the occasion. The address was greatly enjoyed by those who listened to it, and was heartily applauded.

S L. ALLEN & Co., 1107 Market street, Philadelphia, have improved their line of Flexible Flyers, and have entirely remodeled their line of Flyer Sleighs. They have also added a new line of Flyer Coasters to their list, which they make in five sizes, from 30 to 48 inches in length.

THE STANLEY TACK WORKS, Belleville, Ill., have recently added to their line of tacks and small Nails a full line of Staples and double-pointed Tacks, which they furnish bright, blued coppered, galvanized and tinned. The assortment of Staples thus manufactured includes Steel Spring, Bed Spring, Electricians', Clamp, Hoop, Poultry Netting, Blind, Tube, Broom, Pail, &c.

IN OUR ISSUE of 5th inst., in referring to the Mowers of the Dille & McGuire Mfg. Company, Richmond, Ind., we mentioned that in the neighborhood of 50 of these machines were in use on the World's Fair Grounds. This statement was inaccurate inasmuch as the precise number of McGuire's Diamond Lawn Mowers furnished the Fair was 105. The company advise us also that their Mower was the only one officially used on the grounds.

WEBSTER R. WALKLEY, director and New York manager of the Peck, Stow & Wilcox Company, was nominated for alderman of the twentieth ward in Brooklyn, on the Republican ticket, by the Aldermanic Convention of the second district, which assembled Monday, October 16, at 151 Lawrence street in that city. As the ward is normally Republican by a large majority the nomination is regarded as equivalent to an election.

CLENDENIN BROS., 111 South Gay street, Baltimore Md., are manufacturing a line of flat head improved brass Shoe Nails, referred to in their advertisement in this issue. The fact that these Nails are an improvement on those in general use is emphasized. These goods are put up, as shown in the illustration, in ¼ pound papers and telescope boxes of one dozen each; also in ¼ pound packages and in bulk, including all the regular sizes from ⅜ to ⅝. The firm also make corrugated brass Shoe Nails, and strive to give customers greater value by carefully sorting all the Nails. In addition to these goods they have a capacity for turning out 400 Soldering Coppers per day, making a specialty of the finish. They advise us that the finish is such that the Coppers hold their color for a long time on the jobbers' shelves, a fact which is appreciated by buyers. A specialty is made by this concern of brilliant finish cold rolled copper, to take the place of specially finished copper, without any extra cost than for ordinary finish.

N. R. STREETER & Co, Groton, N. Y., have recently made some changes in their business, by which its scope have been widened and their line of manufactures extended. They have lately put on the market some new goods, among which are Streeter's Sensible Mincing Knives of improved and special designs in one, two and six blades. They are also manufacturing the well-known Mrs. Potts' Sad Irons, together with an original improvement of their own on these goods, which they designate as Streeter's Sensible Cold Handle Pottstown Iron. The manufacture of their Streeter's Cold Handle Sensible Irons is continued, so that the firm's line of Irons is very complete. They are also making a novelty in the way of a Can Opener, known as the New Sprague. The Can Opener is entirely of metal, with the blade secured in the handle, and is nickel plated (dead finish) only. The point is made that the blade fits the slot closely, which causes it to cut tin easily. Some time since we announced that C. M. Avery, who is well known to the trade, had become the direct representative of N. R. Streeter & Co. Since then they have placed the marketing of their goods and the direction of their salesmen in his hands. Mr. Streeter will resume his trips to the Pacific Coast, and personally take charge of the interests of the firm west of the Rocky Mountains.

IN HIS ADVERTISEMENT appearing in Special Notices in this issue, J. H. Hillman, manager of the Pittsburgh Sales Agency, 8 Wood street, Pittsburgh, Pa., announces that that concern is now engaged in the sale and reorganization of manufacturing plants of various kinds. The statement is made that examinations and reports on properties are made and references furnished on application. We are advised that this firm during the past three months have met with considerable success, having effected the sale of three manufacturing properties, and are now conducting negotiations for the sale of a fourth one.

JOHN H. GRAHAM & Co., 113 Chambers street, New York, and New Departure Bell Company, have been appointed exclusive selling agents for the United States for the Lucas Bicycle Lamps, manufactured by Joseph Lucas & Son, Little King street, Birmingham England. They will carry a full line of

Hosted by Google

these Lamps at the above address, including the Holophote King of the Road, the Alumophote, the King's Own, the Kinglet, the King of the Road, the Pioneer, the Orient, the Club, the Pathfinder, &c.

THROUGH AN ERROR in *The Iron Age* of October 5 Andrews & Dawes were referred to as located at St. Johnsbury, Va., instead of Vermont. The firm have recently fitted up a store at St. Johnsbury, Vt., and are enjoying a good business. The store is 18 x 98 feet in size, with plate glass windows and all the modern improvements. Particular attention is given to window dressing, and their display attracts much attention, as it exceeds anything in this line that has been attempted in the town. The firm make a specialty of Cutlery, which they job and of which they carry a large stock. The shelves are fitted with boxes finished in Southern pine for Shelf Hardware, and a number of showcases are devoted to Cutlery and Tools.

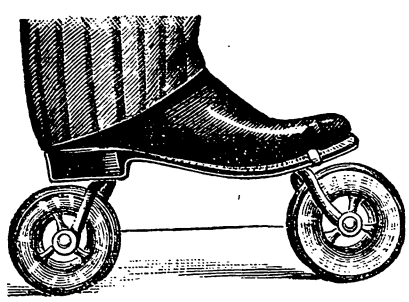
Price-Lists, Circulars, &c.

THE FRED. J. MEYERS MFG. COMPANY, Covington, Ky.: Wire and Iron goods of every description, Bird Cages, Wire Cloth, genuine Hunter Sifters, Iron Fencing and Railing, Iron Shutters, Roof Cresting and Architectural Iron Work, Conductors' Punches, Hardware Specialties, &c. Their fall supplement, which is the first catalogue issued since the disastrous fire of March 5, 1893, by which their entire plant was completely destroyed, illustrates a portion of their goods with descriptions and list prices. A discount sheet accompanies the catalogue.

THE BUCHER & GIBBS PLOW COMPANY, Canton, Ohio: Columbian Catalogue of Gibbs' Imperial Plows. The front and back covers of the catalogue are printed in colors on tinted paper, showing among other things Plows on exhibition at the World's Fair dating from 1776 to 1893. The catalogue gives illustrations and descriptions of Plows, Harrows, Roller and Pulverizer.

COATES CLIPPER MFG. COMPANY, Worcester, Mass: Coates' Clippers. Their catalogue illustrates power Clippers for animals, both hand and machine; parts and pieces of Clipper; counter and shaft; detail of flexible shaft; one-hand Fetlock Clippers, center-tension Magic Horse Clipper, Toilet Clippers, straight and bent, and Coates' Finger-Nail Cutter and Cleaner. Under the head of Motors suitable to run their power shaft are shown the Olin Gas Engine, Tuerk Water Motor, Crocker Wheeler Electric Motor, Kane's Regon Vapor Engine, and Lamb's adjustable animal power.

JULIUS ANDRAE, 225 West Water street, Milwaukee, Wis.: Electrical supplies. The aim in preparing the catalogue and price-list, it is stated, has been to make it complete in every particular, and at the same time compact and convenient to handle. Only those articles have been listed which have proven of practical value, and the catalogue has not been incumbered with useless material. The book contains 128 pages, the first part being devoted to Electrical House Goods, and the second part to Electric Light supplies.



MERIDEN BRITANNIA COMPANY, Meriden, Conn.; New York; Chicago; San Francisco; London, England; Hamilton, Canada: Gold and Silver Plate. Their catalogue, No. 40, contains 130 pages, with handsomely designed cover, and finely illustrated on superior quality of paper. The illustrations show an assortment of their recent productions and most desirable patterns, without attempting to represent their line complete. The scale to which the illustrations are made is given under each heading to assist in determining the actual size of the articles. For convenience of sending telegraph orders a code word in backets is attached to each price. The catalogue is filled with handsome designs in hollow and flat ware, toilet articles, desk bric-a-brac, &c.

THE ENTERPRISE MFG. COMPANY, Philadelphia, Pa.: A supplement for insertion in their May catalogue opposite page 48, covering Detachable Meat Hooks made under Charlton's patent.

T. F. WELCH & Co., 65 Sudbury street, Boston: Hardware and Tools, Gears and Gear Cutting. Their illustrated price-list for 1893-94 includes Gears, Chain Wheels, Knurls or Milling Wheels, Steel Wire Springs, pure Aluminum Graduated Rules, Lathe Dogs, Bench Lathes, Countershaft, Iron Pulleys, Thumb Screws, Hand Drilling Machine, Jewelers' Hand Drill Machine, Adjustable Hangers, &c. The manufacturers state that they have facilities for doing small work in metal, such as is required in experimental work, or in repairs of scientific and philosophical instruments.

Pneumatic Road Skates.

THE INCREASING USE of pneumatic tires is indicated in the accompanying cut, which shows them applied to Roller Skates. The Skates are arranged to clamp or strap on the soles of shoes like ordinary Skates, but the rollers are fitted with pneumatic

Pneumatic Road Skates.

tires. The rollers are fitted with ball bearings, and run noiselessly; the rollers being 3½ inches in diameter, the tires 2 inches, and the average weight of each skate is 2¾ pounds. It is stated that the Skates meet all the requirements of road traveling, hills being surmounted and descended, while rough places are rendered smooth by the resiliency of the tire. The Skates are being made, we understand, by J. H. Wilson & Co, 9-13 High street, Kirkcaldy, Scotland.

Huntington-Hopkins Co.

SOME inaccurate and misleading reports have been published in the newspapers of the Pacific Coast, and have obtained some currency throughout the country, to the effect that Huntington-Hopkins Company of San Francisco are retiring from business. These reports, which go into some detail, mentioning the withdrawal of the prominent members of the company and the selling of the company's business to other houses, are referred to as entirely erroneous. We are advised that no such changes have been determined upon and that the company expect to continue in business, maintaining their position as one of the leading jobbing Hardware houses of the country.

Death of William T. Nicholson.

AS WE GO to press we learn of the sudden death yesterday, from apoplexy, of William T. Nicholson, President of the Nicholson File Company, Providence, R. I. This intelligence will be received with sincere sorrow by the trade. Fitting reference to Mr. Nicholson's career as a business man and a manufacturer of exceptional ability and prominence we defer to our next issue.

Humason & Beckley Mfg. Company's Catalogue.

HUMASON & BECKLEY MFG. COMPANY, New Britain, Conn., and 80 Chambers street, New York, have just issued a catalogue, 8½ x 10¾ inches in size, containing 112 pages, bound in stiff cloth covers. The catalogue represents the Hardware and fine Pocket Cutlery manufactured by them, and includes illustrations, descriptions and list prices of Hammers, Saw Sets, Belt Punches, Cheese and Butter Tryers, Wrought Iron and Brass Spring Bolts, Rail Screws, Bright Iron and Brass Wire Goods, Wrought Goods, Ox Yoke Bow Pins, Box and Cotton Hooks, Nut Crackers, Corkscrews, Pocket Cutlery, &c. Some 22 pages are devoted to full size cuts of Corkscrews, which line has been enlarged and the designs improved. For the full sized illustrations and descriptions of Pocket Cutlery 48 pages are required. The makers state that the entire line of H. & B. Cutlery consists of about 600 numbers, and the illustrations are so clear that customers can order with even more facility from the catatogue than from samples.

Paints and Colors.

It should be understood that the prices quoted in this column are strictly those current in the wholesale market, and that higher prices are paid for retail lots. The quality of goods frequently necessitates a considerable range of prices.

In the market for Paints and Colors the experience has been variable, a good volume of business being reported in some departments, while in others the movement continues slower than usual at this season of the year. Upon the whole, the conditions are about the same as they were a week ago and the outlook is without suggestion of any decided change in the immediate future. The cost of production of White Lead and domestic Oxide Zinc is undoubtedly reduced by the decline in prices of crude material. To some extent this fact, along with competition incidental to a quiet period, prompts concessions on prices of several specialties, but quotations for leading staples

Hosted by Google

are remarkably well maintained and the appearances are that distributors have thus far contended quite successfully against the several adverse market conditions. Compared with that of the preceding week, the volume of business has made a favorable showing in most departments.

White Lead.—Outside brands, otherwise the products of corroders who stand entirely independent of the combine, are still selling at irregular prices, with 5½¢ the rule for round lots of dry Lead, and 6¢ for Lead in Oil. With Pig Lead at 3.35¢ @ 3.40¢ here, this shows a handsome profit. The manufacturers of mixed Leads and other cheap pigments put their prices correspondingly low, and while their old list has been continued in force by the National Company, it is claimed that special rates are still being made in quarters where competition is keenest. In short, the market is quite as ragged as it has been at any time during the past month or six weeks and the prospects are the reverse of encouraging for immediate improvement, since buyers operate in an extremely conservative manner.

Red Lead.—Dealings in foreign brands have been on a moderate scale and the demand from leading consumers is at present rather slow. The smaller buyers have purchased sparingly as well, and, upon the whole, the market has shown less spirit than usual at this season of the year. Practically the same remarks apply to the market for domestic product. Prices are no lower, but the market shows rather soft tone, particularly for the foreign brands.

Litharge.—The movement in low grade product employed in manufacturing industries continues moderately active and sufficient to keep prices quite steady. Higher grades that are used chiefly in the Paint trade do not fare relatively as well, as far as sales are concerned, but the business passing is chiefly at old prices.

Orange Mineral.—Barely the average purchases have been made during the past week, and the market at present is quiet. Prices are rather soft, but show no radical change.

Zincs.—Crude material is very cheap and leaves manufacturers of Oxide to fill contracts at prices somewhat below popular quotations. That special rates are made in remote instances is not improbable, but manufacturers generally quote the old range and claim that new orders are sufficient to keep the market in very good form. Foreign brands are quoted as before, but some jobbers still shade the official list a trifle.

Colors, &c.—Some lines of dry Colors used by grinders and in other manufacturing lines have been taken to a very fair extent, but the movement does not appear to be above the average for the season. The finer class of Dry and Oil Colors have met with merely routine sale, and trade in ready mixed Paints, with few exceptions, is represented as being somewhat disappointing, with prices low and irregular for other than strictly high grade goods.

Chalk, Whiting, &c.—Block Chalk has been quiet, and prices remain without change. Whiting has met with rather freer sale, but supplies are ample, and business is effected easily at old prices.

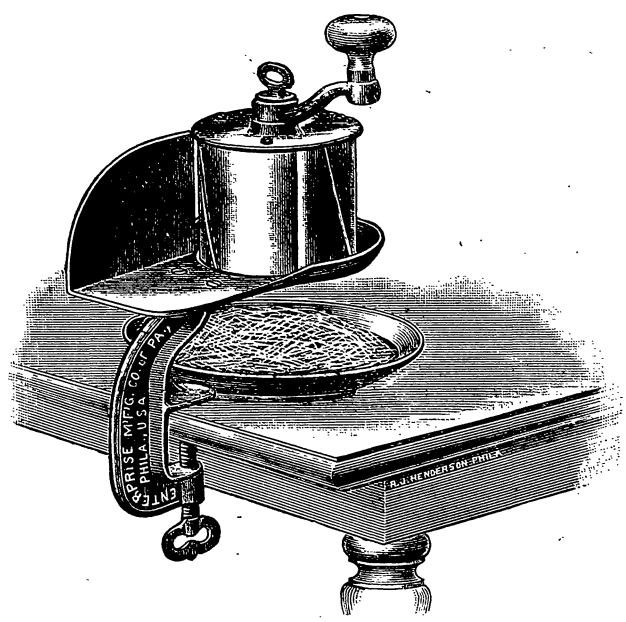
Oils and Turpentine.

Few changes in prices have taken place, but those few were in the direction of a higher level, and it is only in the instance of some few minor articles that the undertone of the market is not firm. Speculation is tame, export buyers are extremely conservative, and home distributors are moving cautiously in the absence of incentives to operations on a broad scale. It would seem, however, that distribution is sufficiently large to prevent anything in the nature of burdensome accumulation at first hands, and to this extent the conditions are more favorable for an upward turn in prices than for movement in the opposite direction.

Linseed Oil.—For the present, there is no lower quotation than 40¢ for local brands of raw Oil manufactured from American Seed, and on Western brands 39¢ is the popular quotation. Some of the non-combine brands of Western product could, however, probably be secured at 38¢ on net cash terms. Sales have been moderate and the demand at present is of strictly routine nature.

Cotton Seed Oils.—Western consumers have purchased quite freely of both crude and refined Oil for shipment in tank cars direct from the mills. Exporters have purchased sparingly, since foreign markets are well supplied. In other directions the movement has been commonplace. Such as it was, however, the movement served to turn a downward tendency in prices, and at present the market shows fairly firm tone, with prices standing just about as they were a week ago.

Lard Oil.—Prices have stiffened still further and 75¢ @ 77¢ is now the range of price for strictly prime present make Oil, with only out of town brands offered at the inside rate. Purchases are restricted with each advance in price and at the moment there is merely a routine business passing.



Fish Oils.—Further liberal sales of crude Sperm Oil have been made in the New Bedford market, but the movement has had no perceptible influence upon prices for refined product in the New York market. Whale Oils in general are quiet and unchanged. The same report will fittingly apply to Menhaden Oils and Cod Oil, there being merely routine movement.

Miscellaneous.—Common Oline Oil in barrels has been selling at about 60¢ on the spot and 55¢ @ 58¢ for future shipment, which prices indicate a rather soft market. Cocoanut Oils are offered rather more freely, with the effect of weakening prices to about 5¾¢ for Ceylon and 6¼¢ for Cochin in round lots. Mineral Oils are selling in routine way only, chiefly at old prices.

Spirits Turpentine.—The market is decidedly firmer under the influence of reports of better demand at various points and alleged reduction in the supply available for immediate shipment. Sales were made at 29¢ for regular and 29½¢ for machine barrels.

Enterprise New Slaw Cutter No. 94.

The Enterprise Mfg. Company of Philadelphia, Pa., are putting on the market a slaw cutter, as herewith shown. In operation the article to be sliced is placed on the platform, being fed or pushed gradually against the revolving cylinder, which contains three knives, the sliced product falling into a receiver underneath. The cutter is intended especially for family use, but also for hotels, restaurants, provision dealers, farmers, &c. The manufacturers recommend the cutter for slicing potatoes—Saratoga chips, for instance—onions, cabbage, cucumbers, citron, &c., and for general slicing purposes.

Enterprise New Slaw Cutter No. 94.

THE WESTERN STEEL PROTECTED GLOVE MFG. COMPANY of Chicago have, at Column O 50, Machinery Hall, World's Fair, a novel exhibit, as well as one which attracts a great deal of attention in the shape of machinery for manufacturing gloves or mittens protected by steel staples. The leather of which the glove is to be made is first cut out. Then the machine takes the steel wire from the spool, and forming a staple over a steel form, it passes down and drives the staple through the leather, clinching it on the reverse side. The glove is fastened upon a frame which moves automatically as each staple is clinched, thus giving it a uniform appearance. They also have a second machine on exhibition, which sews the glove together by means of a steel wire and strap around the thumb, thus rendering it doubly durable. They use oil tanned calfskins entirely, and staples over the front of the hand and on the fingers make the goods very desirable for workmen having rough materials to handle.

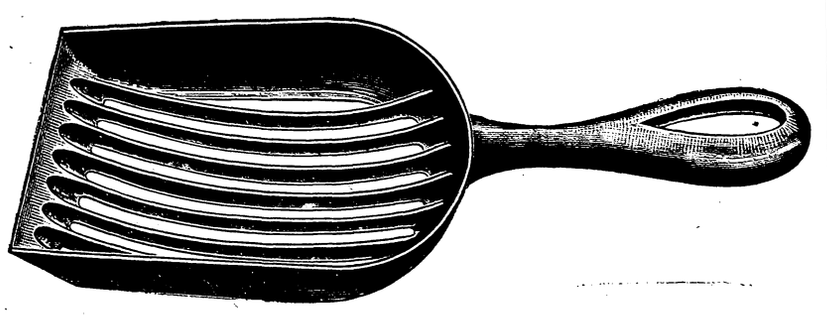
The League Chainless Safety.



The accompanying cut represents the League chainless safety, manufactured by the League Cycle Company, Hartford, Conn. Instead of the usual chain and sprocket two bevel gears, adjusted on ball bearings, whose teeth are accurately cut by a special process, are incased in neat dust proof aluminum boxes in the center of the crank shaft bracket. To one of the gears is attached a shaft that passes through the rear fork of the frame to the rear wheel, where it engages the teeth of two more gears, also incased in dust proof boxes. It is remarked that the gears are accurately adjusted, run in oil and are entirely concealed from view. The manufacturers claim for the wearing qualities of the gears that they will not break and that they will outwear the rest of the machine, also that there is no possibility of their getting out of alignment under the same proper usage as the ordinary chain and sprocket wheel receives. It is further explained that, in case of an accident, a side thrust coming against the vital part, the force would meet with more resistance owing to its coming in contact not only with the rear tubing of the frame, but also with the shaft concealed within; and that, should an accident occur, which would cripple an ordinary machine for use and occasion a long walk home, with the chainless safety it would not deprive the rider of the use of the wheel, though the force of the contact—meeting with the resistance already noticed—should spring the frame out of alignment for any reasonable amount of space. The manufacturers state that their wheel runs as easily as any in the market, climbs hills with one third less labor and saves the rider the trouble and expense incident to loose and gritty chains. The machine is offered as high grade in every respect, and has the indorsement of experienced wheelmen as to its practicability.

The League Chainless Safety.

Coal Shovel and Sifter.

N. R. Streeter & Co., Groton, N. Y., are offering a coal shovel and sifter, as illustrated herewith. The shovel is made of cast iron, nicely jappaned, 9½ inches long including the handle, and 4⅛ inches wide in the widest place. The openings between the ribs are about $\frac{3}{16}$ inch, making it especially very valuable where pea coal is used. The shovel is designed for removing unburned coal from a stove or range when the fire has gone out, instead of dumping the whole mass, as the coal can be taken from the top of the fire box and sifted without raising dust. The point is made that enough coal can often be saved in this way to run a fire from after breakfast until the fire is needed at noon. The shape of the shovel is such that coal can be taken from between the magazine and the fire pot of a parlor or heating stove, a feature which will be appreciated by those whose fire has gone out with the magazine full of coal. The shovel is designed to retail for 10 cents.

Coal Shovel and Sifter.

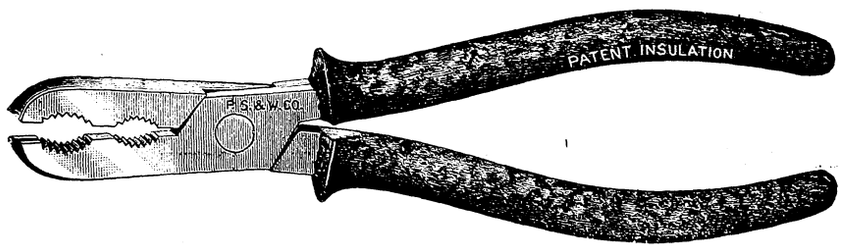
Pneumatic Oil Can.

Nail City Stamping Company, Wheeling, W. Va., for whom the Ross & Fuller Association, 33 Chambers street, are agents, are offering the Nail City Pneumatic 5-gallon oil can. The can is made of heavy galvanized iron, to hold 5 gallons of oil, the oil being forced from the can by atmospheric pressure. By pressing down a plunger, the air forces the oil out by way of the spout, and when the pressure is released the oil ceases to flow. The spout, which is curved at the end, is jointed at the can, and when filling a lamp it is turned down to a horizontal position, so that the lamp is filled without lifting it from the table on which the lamp and can stand. The spout is also reversible, and when reversed the can, it is stated, is vapor proof, thus preventing the escape of gasoline or other vapors from the can. The point is made that the absence of a faucet for drawing lessens the liability of the oil or gasoline being tampered with by children.

The Merrill Heater.

Among the lamp stoves which are at present on the market that recently brought out by Randall & Becton of 19 India street, Boston, Mass., is illustrated in the accompanying cut, and is known as the Merrill. From an inspection of the engraving it will be seen that, generally speaking, the device consists of an ordinary fountain lamp, on the top of the chimney of which is supported a shallow drum formed of two dished disks, joined at their outer edges and presenting the appearance shown. The top disk is perforated near its outer edge with nearly 300 small openings for the discharge of the heated air. The material employed is aluminum, which does not tarnish with use and which greatly resembles silver in its appearance. The lower disk is made of nickel plated brass with an opening for the introduction of the chimney top and is corrugated so as to allow for expansion and contraction. The drum is suspended upon the chimney top by means of hooks, which can be adjusted to suit varying sizes. A nickel plated collar loosely incloses the top of the chimney and permits the entrance of cool air into the drum, thus increasing the circulation. The manufacturers state that the device will not break chimneys nor cause soot or smell. They also claim that by the use of the Merrill heater the current of air is retarded in its upward progress, superheated and discharged in tiny streams into the surrounding atmosphere. The principal object of the construction employed is claimed to be the warming of the greatest volume of air in the shortest possible time.

The Merrill Heater.



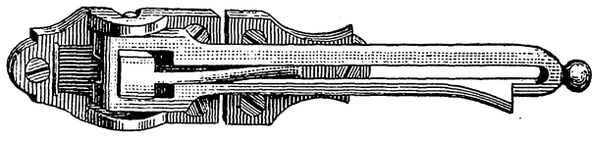
Valves as applied to gas, water or steam fittings are commonplace enough, but such a contrivance in operation on

Hosted by Google

a horse is unusual. A horse belonging to Abeel Bros., iron merchants, 190 South street, was found to have a difficulty or obstruction in the head, which prevented him from obtaining a sufficient quantity of air through the regular channel. To supplement the supply of air it was found necessary to insert a metal valve consisting outwardly of a thin metallic disk about 2 inches in diameter, in which was a ¾-inch round hole. This was placed some 15 to 18 inches down from the throat. Inside the disk was the necessary mechanism, with a counter flange to keep it in place.

Insulated Gas Pliers.

Peck, Stow & Wilcox Company, Southington, Conn., and 27 Chambers street, New York, are introducing insulated gas pliers, as illustrated herewith. The insulation with which the handles are covered is molded mica, mica being, it is understood, one of the best insulators known to modern science. The manufacturers state that the pliers will insulate against 1500 volts of electricity or even more; and that the mica will not chip or come off. The pliers are made in one size—7 inch—and are designed as a protection to those working



Insulated Gas Pliers.

about gas fixtures which are connected with electric wires.

Combined Door Lock and Ventilator.

The Brooklyn Specialty Company, 166 Pierrepont street, Brooklyn, N. Y., are offering this door lock with safety attachment and ventilator combined, as shown herewith. It consists of a plate and swinging hasp, which is screwed on the door jamb, and a plate and stationary bolt, which is screwed on to the door, in the positions shown in the cut. On the plate under the end of the hasp is a flat steel spring which holds the hasp at any angle and yet allows it to be moved by hand or by the action of the bolt as it slides along in the groove of the hasp as the door is opened or closed. For ventilation, notches on the under side of the head of the bolt engage with the offset near the outer end of the hasp. In this manner the door may be held open 4 or 5 inches. As long as the bolt is within the groove of the hasp any person outside the door is prevented from entering. When it is not desired to use the lock the hasp

Combined Door Lock and Ventilator.

may be swung back against the jamb, thus giving a person on the inside full control of the door, either to open or lock it without inconvenience and with the least effort. The hasp is 5½ inches long; the entire lock is nickel plated, neat in appearance and can be used on either right or left hand doors. The lock is designed as a substitute for the chain bolt, and the manufacturers claim that it is easily attached to a door, that there is no swinging chain to deface the door or jamb and that it is positive in its action.

Automatic Steam Coffee Cooker.

Wilmot Castle & Co., Rochester, N. Y., manufacture a coffee pot on the same principle that is embodied in their Arnold automatic steam cooker. Fig. 1 shows a general view of the pot, while

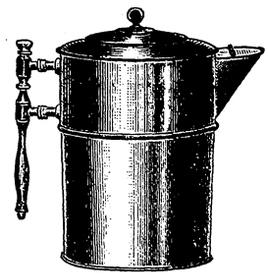


Fig. 1.—Automatic Steam Coffee Cooker.

Fig. 2 shows a sectional view through the pot and the steam cooking attachment. It is pointed out that coffee cooked with

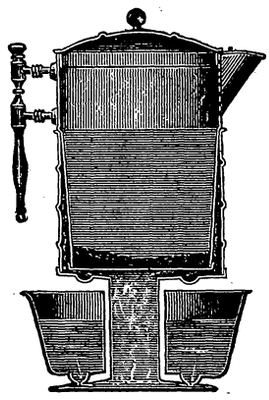

Fig. 2.—Sectional View through Pot and Steam Cooking Attachment.

steam at an unvarying temperature of 210° cannot boil, and it is therefore much better and more wholesome. The steam generated in the tin vessel under the pan rises around the coffee pot and drips back into the reservoir. Extra pots are used for tea, which, the manufacturers claim, should be prepared in the same manner. Urns for boarding houses and small hotels are also made on the same plan.

Current Hardware Prices.

OCTOBER 18, 1893.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

The character @ is used to indicate a range of price; thus discount 50&10@50&10&5 % signifies that the goods in question are sold at prices ranging from discount 50 and 10 % to discount 50 and 10 and 5 %.

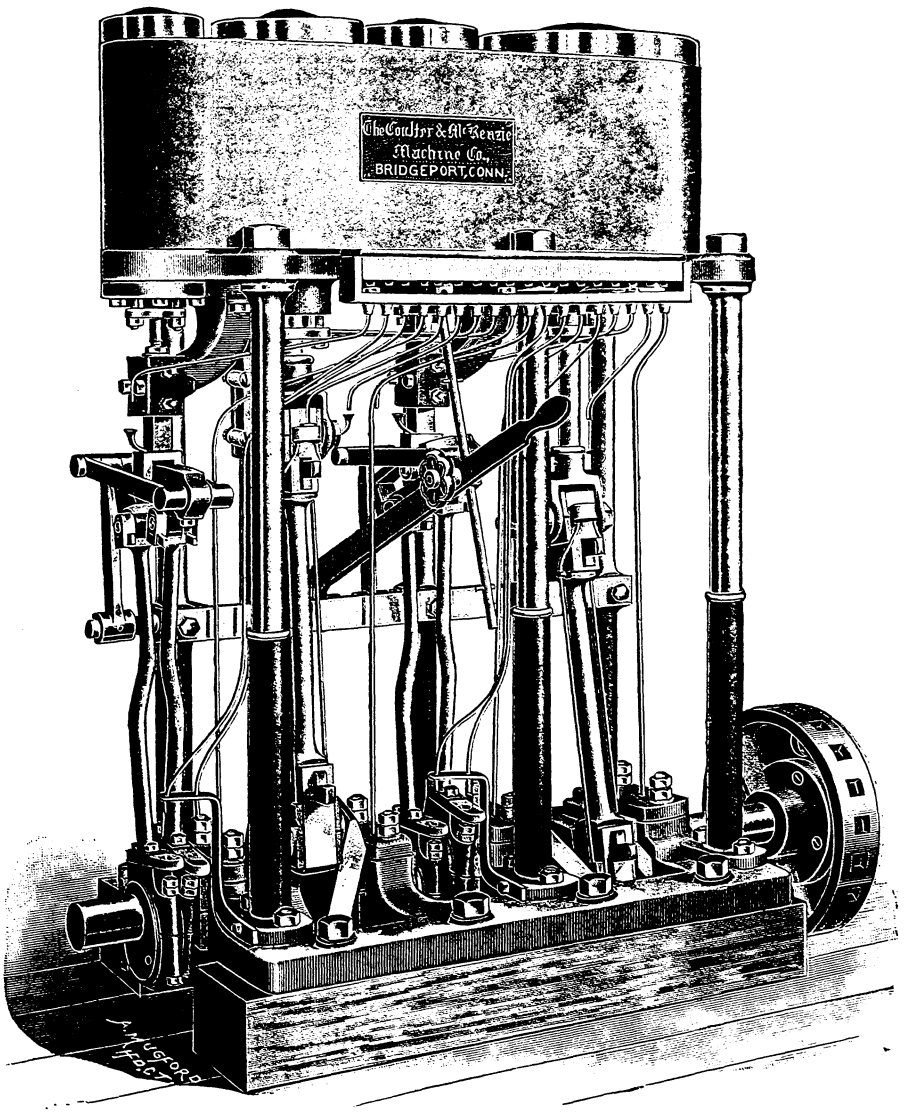
THE IRON AGE

THURSDAY, OCTOBER 26, 1893.

A 1200 Horse-Power Turbine for Niagara.

Another large water wheel has just been shipped to Niagara Falls by James Leffel & Co. of Springfield, Ohio. It is a duplicate and of nearly the same power as one which was shipped some six months ago to the Cliff Paper company and is intended for the same parties. The wheel is of the new type, on horizontal shaft, and is known as the James Leffel double discharge turbine, with a heavy iron center. The wheel will connect direct to the wood grinding machine. The company have just completed a very original and unique design of wheel plant for another New York company. It comprises four wheels in one system, being a quadruple wheel of 1000 horse-power, to operate under a 40 foot head.

Baltimore had last week a practical illustration of the dangers lurking in overhead electric wires, when a large blaze, which spread to the jail and entailed some loss of life, was started by electric wires being blown together during a gale. The cross currents burned out the wires, which fell and set fire to adjoining wood work.



A large deal in lumber is reported from Bangor, Maine, between 10,000,000 and 15,000,000 logs having been sold a few days ago to a syndicate for $100,000 to $150,000 cash. The price was $8 to $10 per 1000, the lowest known since the war.

The Steam Yacht "Dream."

Our illustrations show the most essential features of what is stated to be the largest and fastest steamboat ever built in Bridgeport, Conn. It was designed for G. W. Hills, proprietor of the *Evening Post* of that city. It is 60 feet long over all, 12 feet beam and 5 feet depth and draws 20 inches forward and 3 feet 4 inches aft.

The power required is supplied by water tube boiler of the Herreshoff type, which is of ample size and is fed by a Marsh steam pump. A Worthington double acting vacuum pump controls a keel condenser consisting of 48 feet of 3 inch pipe.

The engine, as shown in the prospective view and in the sectional drawings, Figs. 3 and 4, is a fore and aft compound, designed and built by the Coulter & McKenzie Machine Company of Bridgeport. It is capable of furnishing 75 horse-power, and will turn a 3 foot screw of 4 feet 7 inches pitch 250 turns per minute with 100 pounds of steam. The high pressure cylinder

THE STEAM YACHT "DREAM."—*The Engine.*

the entire weight being 30 tons. The water will be conducted to the wheel from a canal at the top of the cliff by an 8-foot pipe, extending downward until it reaches the mill, located near the foot of the cliff. The water will enter the cylinder casing of the wheel from below, passing upward a few feet, filling the case, and thus obtaining the head pressure. The amount of head will be about 130 feet; the wheel being some 67 inches in diameter, a speed of 225 revolutions will be obtained and almost or quite 1200 horse-power developed. The runner is made of bronze,

Hosted by Google

is 6 inches in diameter, the low pressure 12 inches and the stroke 9 inches. Both cylinders, as shown plainly in Fig. 3, are cast in one piece. The exhaust from the high pressure cylinder passes around that cylinder and into the low pressure valve, thus making a receiver and jacket in one and permitting the passage of steam to the low pressure cylinder without piping.

The pistons are fitted with a sectional Dunbar packing, consisting of a solid center, or "bull" ring, on each side of which is fitted an L-shaped ring and a square ring, as shown in Fig. 5. These rings are cut in three or four segments, as may be desired, and are adjusted so as to break joints. The rings are pressed against the walls of the cylinder by means of round wire springs of a diameter equal to the inside width of the rings. This construction insures even and sufficient pressure of the rings against the cylinder.

The valves are of the balanced piston

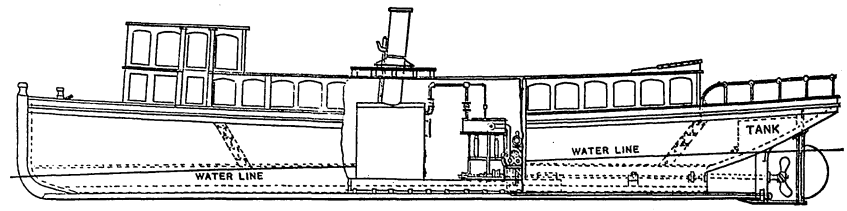


Fig. 2.—Longitudinal Section.

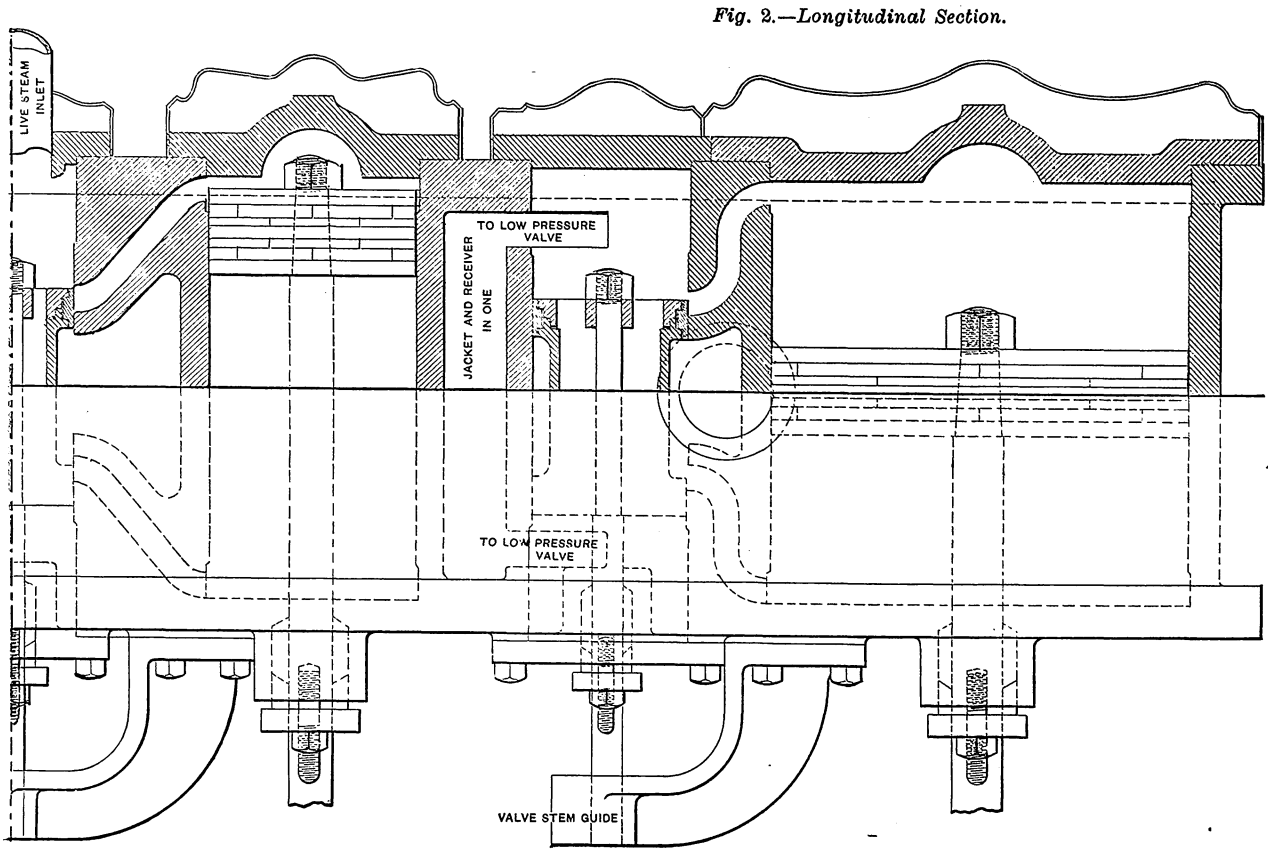

Fig. 3.—Vertical Section through Cylinders.

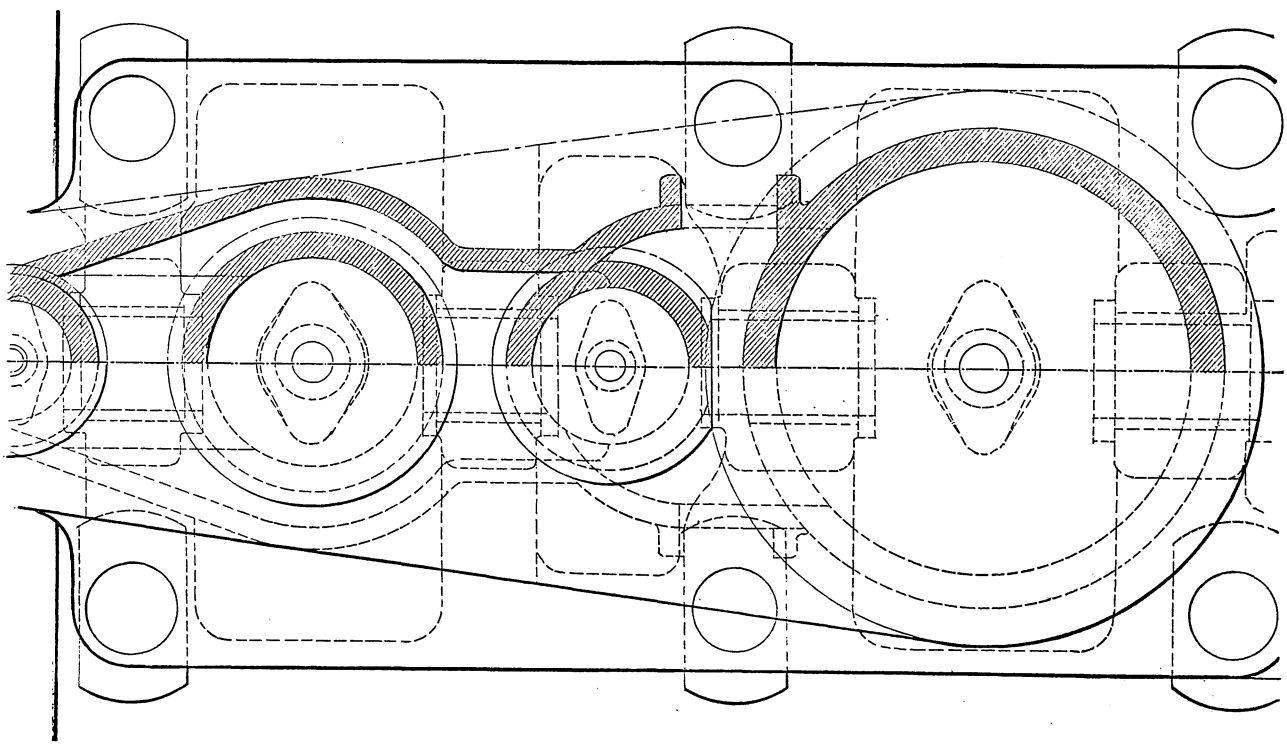

Fig. 4.—Sectional Plan of Cylinders.

THE STEAM YACHT "DREAM."

Hosted by Google

type, made up of a center and two end pieces held together by the valve stem and fitted with a steam tight ring on each end. The live steam enters on the top of the valve, passes through the center and enters the cylinder from each end, the exhaust steam passing around the center, as will be understood from Fig. 3. The valves are operated by a Stevenson link motion, the connections of which have every adjustment. The link blocks are bronze bushed, with a hardened and ground steel bush working on a hardened steel pin. The links are made in halves and bolted together.

The cylinders are supported upon six steel columns which are securely fastened to a substantial cast iron bed piece, making a frame which permits ready access to every part of the engine for repairs or adjustment.

All the rods, connections and links have every means of adjustment for taking up wear. The shaft is of steel 3¼ inches in diameter and has bearing surface of 18 inches on the bed. The crank pins are 2¾ inches in diameter by 3 inches long, and are set at an angle of 90 degrees. The shaft is fitted with a fly wheel which is also used to balance the two cranks and forms one-half of the coupling connecting the wheel shaft. The cylinders and their heads are neatly incased with German silver covers.

The propeller shaft is fitted with a patented roller thrust bearing of new design, shown in Figs. 6 and 7. It consists of a box casting, in which are fitted two bearings, one on each end. Centrally between these bearings is a thrust collar clamped rigidly to the shaft. On each side of this thrust collar is a loose steel collar having four projecting arms or studs on which rollers are loosely mounted. The thrust of the shaft is received by these rollers, which are turned slightly rounding on the face so as to overcome the sliding motion that would occur if they were flat. One set of these rollers acts when in head motion and the other when in back motion. The box containing this bearing is filled with oil, so that the parts are constantly lubricated and friction is reduced to a minimum.

On the front and bottom of the cylinders is a reservoir for oil, under which there is fitted a trough holding 18 separate pipes which carry the oil to the different bearings. All the bearings are also provided with separate oil holes to be used in case of need.

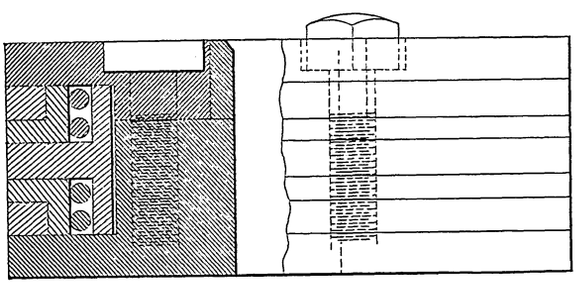

Fig 5.—Section Showing Piston Packing.

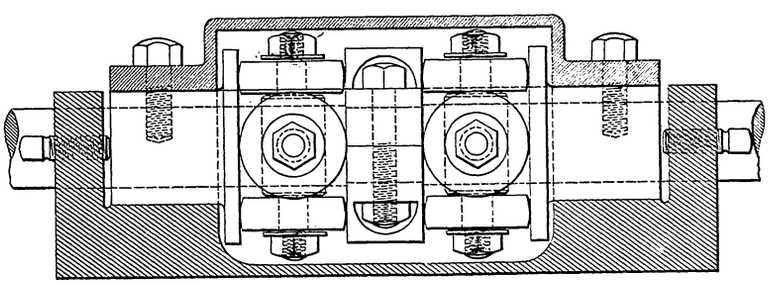

Fig. 6.—Longitudinal Elevation of Thrust Bearing.

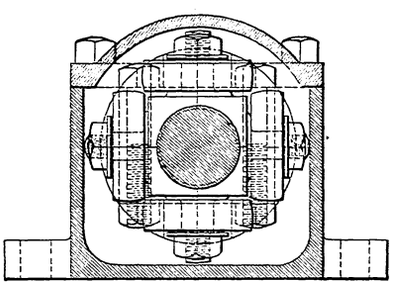

Fig. 7.—Cross Section of Thrust Bearing.

THE STEAM YACHT "DREAM."

The unofficial speed trial of the United States cruiser "Columbia," the first of the new triple screw commerce destroyers, took place outside the mouth of the Delaware River on October 18, and resulted in the attainment of the very satisfactory record of 21.5 knots an hour. The contract speed was 21 knots; and it is anticipated by the builders that this speed will be exceeded, on the official trial, by a knot or a knot and a half. The Cramps, therefore, are certain of securing a substantial premium.

The fact that several non-union rolling mills west of the Alleghenies are having their puddling done for $4 per ton is troubling those operators who signed a $5 scale several weeks ago. They have asked their workmen to make a concession, but so far none of them have signified their willingness. They say that they are sorry to learn that their employers cannot compete with non-union mills, but they do not offer the requisite remedy.

Some of the English newspapers print a letter from Thomas Hampton, Grangeville, Millhouses, near Sheffield, in which claims are advanced in behalf of a new steel process. The absence of any data concerning the details of the process is striking. The simple statement is made that the pig is blown in the lime lined Bessemer converter, and that the point of the method is the elimination of sulphur from the desiliconized and decarbonized metal during the after blow.

WORLD'S FAIR NOTES.

The display of steam pumps in Machinery Hall is extensive, as might be expected. In the center of the building a large water tank has been located for the purpose of supplying adjacent exhibitors who desired to display their apparatus in operation. The tank lies below the level of the floor and thus presents an opportunity for some spectacular features in the delivery of streams from numerous nozzles. While most of the pump exhibits are grouped about this tank, some very prominent manufacturers have located elsewhere, notably Henry R. Worthington of New York, whose great display of pumping machinery has been previously described in these columns. The Worthington pumps are in regular use supplying water for the general purposes of the exposition. There are other manufacturers whose pumps are found in use in the power house attached to Machinery Hall, no attempt being made at a display on the floor of the building. Among these may be named the Barr Pumping Engine Company of Germantown Junction, Philadelphia; Battle Creek Machine Company of Battle Creek, Mich.; George F. Blake Mfg. Company of New York; Blakeslee Mfg. Company of Duquoin, Ill.; Boyts, Porter & Co. of Connellsville, Pa.; M. T. Davidson of Brooklyn; Deane Steam Pump Company of Holyoke, Mass.; Hall Steam Pump Company of Pittsburgh; Knowles Steam Pump Works of New York; Lawrence Machine Company of Lawrence, Mass.; Smedley Mfg. Company of Dubuque, Iowa; Snow Steam Pump Works of Buffalo, N. Y.; Sulzer-Vogt Machine Company of Louisville, Ky.; Joshua Thomas of Cleveland, Ohio; Wainwright Mfg. Company of Boston; N. A. Watson of Erie, Pa; Wilson-Snyder Mfg. Company of Pittsburgh. The descriptions of regular exhibits are appended.

John H. McGowan Company

of Cincinnati, Ohio, and Richmond, Va., have taken unusual pains in fitting up an attractive display at Columns K and L 36. In the center of this large space they have erected a fountain with a glass dome, under which a constant stream of water is forced in a circular sheet by one of their twin lever valve pumps. Other pumps are in operation discharging streams of water in the great central tank. The pumps displayed comprise a number of patterns—direct acting, duplex, and crank and fly wheel types. There are also air pumps and hydraulic presses. The twin lever valve used in the company's duplex

Hosted by Google

pumps is a special device for which strong claims are made of positive action, securing exact work by both levers. It has been made to conform as nearly as possible to the action of the governor of a steam engine. The full power of the stroke is secured and provision is made to compensate for natural wear. A Glide direct acting pump is shown, which is a new pattern but recently brought out. In this the slide valve is actuated by a steam moved piston that reverses only at the completion of the stroke of the main piston. There are no outside valve movements. Suction and force pipe openings are on both sides, except in the case of the 10-inch stroke pumps, which have a T discharge on top that can be turned in any direction. The company have just bought the patterns, machinery, &c., for deep well pumps of the Bradford Well & Pump Company of Cincinnati, and will hereafter manufacture a line of such pumps in addition to their regular patterns. Some of the company's pumps are also at work in the boiler house.

Laidlaw-Dunn-Gordon Company

of Cincinnati, have a large working exhibit at Column I 33. There are 12 pumps in all, of which one is a compound 14 x 20 inches and 12 x 18 inches, throwing 2,000,000 gallons in 24 hours; six are standard duplex pumps of different sizes, ranging from 14 x 8 x 10 inches down to 4½ x 2¾ inches. One is a single direct acting, 10 x 6 x 12 inches; two are deep well pumps, one of these being 8 inches diameter by 36 inches stroke and the other 5 x 24 inches; one is a fire pump 14 x 7 x 12 inches, throwing two streams into the great central tank from 1½ inch nozzles, discharging 500 gallons per minute. The company also have some of their pumps at work in the boiler house.

Joseph Menge

of New Orleans, La., shows a remarkably effective pump for certain classes of work at Column I 34. It consists merely of a bucket wheel, 20 inches in diameter by 6 inches in width, run by a belt, with a lifting capacity of 300,000 gallons per hour. It is adapted to irrigation or drainage purposes, and as shown in Machinery Hall, discharges a volume of water like a miniature Niagara.

Buffalo Steam Pump Company

of Buffalo, N. Y., at Column K 29, exhibit a number of duplex pumps, some of which are in operation. There are also single direct acting pumps, single cylinder air pumps and jet condensers. In this exhibit the water is pumped into an elevated tank which is used as a reservoir to show the action of a large hydraulic ram made by Rife's Hydraulic Engine Mfg. Company of Roanoke, Va. This ram forces a remarkably large stream of water through the top of a tall pipe. The company claim to manufacture hydraulic rams of larger capacity than any others in the world.

A. S. Cameron Steam Pump Works,

foot of East Twenty-third street, New York, have a large exhibit at Column K 31, while some of their pumps are also in active service in the boiler house. Pains are taken in this exhibit to show the system on which the Cameron pumps are built. Caps are removed and the interior mechanism is exposed, showing that there are very few working parts. In addition to regular patterns, there are long stroke pumps for rolling mills or other service in which heavy continuous pumping is required; double plunger pumps, for feeding boilers under heavy pressure; mining pumps of the double plunger pattern; vertical mining pumps, for use in sinking or recovering shafts; direct acting vacuum pumps, for sugar refineries, glue factories, &c., and sugar refiners' vacuum pumps with fly wheel.

Gould Mfg. Company

of Seneca Falls, N. Y., are large exhibitors of pumps at Column B 47, also at J 28, in Machinery Hall, besides the boiler house, in Electricity Building, &c., but their exhibits have been previously described in these columns.

Geo. E. Nye

of 74 and 76 West Washington street, Chicago, makes an interesting exhibit at Column K 30. The Nye pump is of peculiar appearance, consisting of two rectangular chambers mounted on a tripod. These chambers are of cast iron. There are no pistons, but the pump is operated by the formation of a vacuum through the condensation of the exhaust steam. A small condensing chamber is placed in the rear of the two rectangular chambers. The parts are very simple, steam being admitted by a balanced automatic valve on the top of the chambers, while the suction and delivery ports are covered by four common claque values. But little floor space is occupied, and a very small amount of steam is used. One of the pumps shown in operation works admirably with the supply pipe valve almost closed. It works so smoothly that it requires no bolting down, and it will pump from 40 to 60 per cent. of sand without injury. The exhibit includes a pump with a capacity of 1000 gallons per minute, which is the largest kept in stock. Larger sizes are made on special orders, from patterns on hand.

The Downie Pump Company

of New Brighton, Pa., make an exhibit at Column L 35 of pumps for deep wells. Their pumps are intended specially for artesian wells, but are adapted to any water service where the supply is obtained from wells. These pumps are shown in operation, and comprise double and single-acting for steam, belt or wind power.

Miller Steam Pump Company

of Dixon, Ill., make an exhibit at Column K 35 of duplex pumps for boiler feeding. One of these, 7 x 4½ x 8 inches, is shown in operation. Other pumps in the display, but not steam connected, cover much larger capacities. They are intended for either hot or cold water. The plunger is of new design, and there are other special features. Pumps of this company's make are also in use in the boiler house.

The Stilwell-Bierce & Smith-Vaile Company

of Dayton, Ohio, occupy a large space at Column J 37 in the display of their pumps and other specialties. A number of Smith-Vaile steam pumps of large capacities are shown, also Victor turbine wheels, the Stillwell live steam purifier, and the Stillwell close heater. This is a "still" exhibit, none of the machinery being shown in operation. Smith-Vaile pumps are, however, in use in the boiler house. The company have branch offices at 63 South Canal street, Chicago, and 112 Liberty street, New York.

Union Mfg. Company

of Battle Creek, Mich., make an interesting exhibit at Column S 30 of their Burnham and Frost pumps. The Burnham pumps shown are direct acting, boiler feed or pressure tank or light service, deep well and vacuum. The special feature of these pumps is an automatic device for creating a steam cushion to insure a uniform travel of the piston under varying degrees of load. The Frost boiler feed pumps shown are so constructed as to utilize the waste heat of the exhaust steam in heating the water on its way to the boiler. With this pump, therefore, the engine is not robbed of its power, as the exhaust steam is condensed and returned to be again used. R. J. Dillon & Co., 25 West Lake street, Chicago, are exclusive Northwestern agents for these pumps.

The Turner Machine Company

of 35 West Fourteenth street, New York, exhibited at Column I 34 rotary pumps, air compressors, painting machines and ice making machines. A rotary pump is at work pumping water on the coils of an ice making machine. This pump is of peculiar type, combining the qualities of a steam engine, water motor, fluid pump, air motor, vacuum pump and air compressor. Unlike all other rotary machines, the blade or gate is in contact with the casing or cylinder continuously. The shaft being set eccentric carries the drum, which in turn receives the blades or gates and permits them to slide back or forth as it revolves. These blades are connected by pins or bars piercing the shaft, so that they are practically solid from side to side. The casing is not a true circle but a curve made to accommodate the eccentricity, thereby gaining a practically solid piston moving in a rotary track without springs or valves. A positive air blower of small size is shown which is guaranteed to compress to 30 pounds in a steady blast. It is said to be the only rotary machine made that will do this work. Other sizes are made which will compress up to 300 pounds. One is at work compressing ammonia at 120 pounds in connection with an ice machine. An interesting part of the exhibit is one of the painting machines used in painting World's Fair buildings. The company's air compressor was used in operating this machine at the time, which was the first occasion of its application on a large scale to the painting of buildings.

The Deming Company

of Salem, Ohio, have a fine exhibit of steam and hand pumps at Column K 33, which has already been described in these columns. The display of hand and windmill pumps is worthy of notice in this connection. There are quite a number of exhibits of this character.

The Hayes Pump & Planter Company

of Galva, Ill., make a very good display at Column L 34. Their specialty is double cylinder pumps for hand or power. These are shown in a variety of sizes, some being in operation. There is also an array of force and windmill pumps of different styles arranged attractively. The company manufacture three and six cylinder power pumps for service in pumping a large volume of water.

Sandwich Enterprise Company

of Sandwich, Ill., make an exhibit at Column K 35. The special feature of this exhibit is an aërating pump, which

Hosted by Google

has but recently been brought out, for the purpose of purifying cistern water. It is an iron pitcher pump with the valves so arranged that they can be reversed by suitable levers. When reversed the pump works down instead of up and forces air into the cistern through the perforations in the lower part of the pipe. The reversing operation is almost instantaneous. The pump is shown in operation attached to a glass tank filled with water. Other pumps shown are windmill and force pumps in a variety of patterns.

Bucket Pump Company

of 441 Plum street, Cincinnati, also show purifying cistern pumps at Column K 29. One of these is in operation, with a dummy appropriately clad as a farmer's boy attached to the crank, so that he is constantly in motion, attracting much attention. The tank has glass sides to permit the aëration of the water to be seen. This pump has a series of buckets which conduct a supply of air into the water whenever the pump is at work.

H. Dickinson & Son

of Lowell, Lake County, Ind., exhibit another water purifying pump at Column L 34 This pump is composed of an endless chain, along which at regular intervals galvanized iron buckets are attached. Each of these cups is perforated at the bottom to allow the gradual escape of air from it as it goes bottom upward into the water. The bottom wheel is of such construction that it becomes an agitator also and assists in purifying the water. One of these is shown in operation in a glass inclosed tank.

The Rider Engine Company

of Walden, N. Y., have a very fine exhibit at Column K 36 of Rider and Ericsson hot air pumping engines. Many of these are in operation, the air being heated by gas jets. Some of them are used to force water to a considerable elevation. Familiar as these engines have now become in most sections of the country, the exhibit is constantly surrounded by groups of eager observers to whom the motive power is a deep mystery. The company have branch offices at 37 Dey street, New York, and 88 Lake street, Chicago.

The Penberthy Injector Company

of Detroit, Mich., make one of the prettiest exhibits to be found in Machinery Hall. It is located at Column N 24. Here the company have erected an ornamental booth having a cornice of oil cups, while the front railing is composed of injectors and ejectors neatly woven together, combining strength and beauty, the different parts being alternately gold and silver plated. A small engine and boiler built by the Lenox Machine Company of Marshalltown, Iowa, stand in the rear of the exhibit, equipped with Penberthy injector, ejector and oilers ready for use, but owing to the usual heat of Machinery Hall it has not been found desirable to keep the plant in operation. Attractively arranged on pyramidal shelves are handsome specimens of Safety wrist-pin oilers, XL injectors, IXL spring cover oilers and Pemberthy injectors in a wide range of sizes. The company have only been in business seven years, but in that brief period they have put in use over 70,000 of their injectors, and are now shipping them all over the world. Their popularity is largely due to their simplicity. They can be very easily taken apart to be cleaned and as readily put together again.

The Detroit Lubricator Company

of Detroit, Mich., also have a very pretty display at M 25. They have erected a handsome booth, the front of which is inclosed by a railing made of pipe fittings and hot water valves, the latter being so arranged that the hand wheels make effective decorations. The exhibit is composed of a great variety of locomotive and stationary lubricators, glass and brass oil cups, low water alarms and hot water valves. Among these are the Detroit improved cylinder lubricator, triple cylinder lubricator, air pump lubricator, automatic sight feed lubricators in several styles for various uses, glass body oil cups with index and sight feed, plain cylinder lubricators, plain brass oil cups, the Garfield automatic injector and quick opening radiator valves with and without union. These are arranged on show stands made of nickel plated tubing. The stands are tastefully designed, having numerous branches, some straight and others curved, to which goods are attached, resplendent in polished brass and nickel. Five awards have been bestowed on this company, covering their locomotive and stationary lubricators, glass and brass oilers, low water alarms and hot water valves. A medal and diploma were awarded their locomotive lubricator.

Schaeffer & Budenberg

of 66 John street, New York, make a fine display of their specialties at Column K 25. Quite a large space is here inclosed, on one corner of which they have erected an ornamental iron post fitted with a clock having faces on two sides, which are surrounded by several gauge faces, while a gilt eagle graces the top. A large vertical glass case in the center of the space contains specimens of many kinds of gauges, ranging from the largest sizes to the most diminutive ones. Among these are the new Columbian and Metropolitan pressure recording gauges for either fluids or gases. On shelves and stands are exhaust steam injectors, steam jet pumps, Holt's reducing valves and Acme steam traps.

Ashton Valve Company

of Boston exhibit at Column M 27 a great variety of safety valves, comprising pop safety valves for all sorts of boilers, noiseless safety valves for locomotive and marine boilers, relief valves for pumps and stand pipes and pressure and vacuum gauges. These are arranged on a large pyramid of shelves in the center of the space and on stands and shelves along the sides.

Hancock Inspirator Company

of Boston exhibit inspirators and ejectors at Column K 33. Numerous specimens of these devices for both locomotive and stationary boilers are shown on stands and platforms, and a practical exhibit is also made of two inspirators attached to a boiler and tank as in actual service. In connection with this exhibit specimens are shown of the Tripp metallic packing.

L. Schutte & Co.

of Philadelphia exhibit at Column M 26 a variety of their specialties, such as exhaust steam induction condensers, Korting's Universal double tube injectors, Universal syphons, hydraulic valves, &c. The special feature of this display is a 20-inch induction condenser, which is so large that a stairway has been built for visitors to reach the top of it. This condenser is intended for a 20-inch exhaust pipe.

The Notham Mfg. Company

of New York and Chicago have a large display at Column M 26 of oil cups for locomotives and stationary engines, injectors, ejectors, and other steam goods. The specimens of oil cups shown cover a very great range of sizes, from huge ones to the smallest kind in practical use.

Roe Stephens Mfg. Company

of Detroit, Mich., exhibit as the central feature of their display at Column M 29 a huge model of one of their Scott pop safety valves. It is mounted on a large platform, and is a conspicuous object in that portion of Machinery Hall. Grouped about the base of this structure are a great variety of specimens of Orme pop valves, Scott safety valves, check and gate valves, angle globe valves, Goldsmith throttle valves, &c.

Fisher Governor Company

of Marshalltown, Iowa, show at Column M 24 a full line of the now well-known Fisher steam pumping engine governors, gravity governors and reducing valves. Fourteen sizes of steam pump governors are shown, adapted to all the various uses and purposes for which steam pumps are used. Their function is to save the engineer the constant care of the throttle and to insure a uniform pressure at all times. In this way overpressure is prevented, which leads to the bursting of mains or hose during fire duty or of pipes or tanks or the flooding of floors. They are in growing use on hydraulic freight or passenger elevators. Two governors are shown for hydraulic pressure pumps, also three sizes of governors for fire pumps and steam pumps on automatic sprinkler systems, as well as those sizes of gravity governors for steam pumps filling elevated open tanks for elevator, house or factory use. The gravity governor automatically starts and stops the pump as may be necessary to keep the water at the hight desired in the tank. Three sizes are further shown of reducing valves for steam, gas or air, which reduce initial pressure to any lower point desired and hold it uniformly.

Trimont Mfg. Company

of Roxbury, Mass., make an exhibit at Column M 31 of their Trimo wrenches. These wrenches are made with removable pipe jaws in a variety of sizes adapted to all classes of work. The Trimo combination wrench shown has double jaws, projecting on opposite sides, one set for plain work and the other for pipe.

The Brass & Iron Works Company

of Fostoria, Ohio, have a comprehensive exhibit at Column K 28. It covers a variety of tapping machines for tapping street mains, which are shown applied to pipes in position for work; a large number of well finished brass valves and couplings, and an array of special pipe fittings. These fittings are intended for use on iron pipe without cutting threads, and on lead pipe without the use of solder. The device is an ingenious one and accomplishes its purposes effectively. Another exhibit is a well drilling machine, with engine and tools complete, which stands ready to sink a well for natural gas, oil or water. There is also shown a line of Able's patent gate valves for water works service.

The Construction of Steamboats Navigating the Western Waters of the United States.—II.*

BY JOHN M. SWEENEY, WHEELING, W. VA.

In the steam engineering department the rules of the United States Board of Supervising Inspectors of Steamboats adopted in 1873 work radical changes in construction. These rules, about coincident with the introduction of steam boiler plate, based the allowable working pressure of steam upon the tensile strength of the material. Now, a high steam pressure is the great desire of every boatman's heart, and at once the greatest tensile strength obtainable was demanded. Seventy thousand pounds was generally adopted, but in some few cases 80,000 pounds was attempted. The amount of carbon, however, required in such plates at that period of steel plate development produced some very unsatisfactory results, and the further action of the supervisors requiring a reduction in area of at least 50 per cent. for plate 0.26 inch thick has brought the commercial product down to about 65,000 tensile strength.

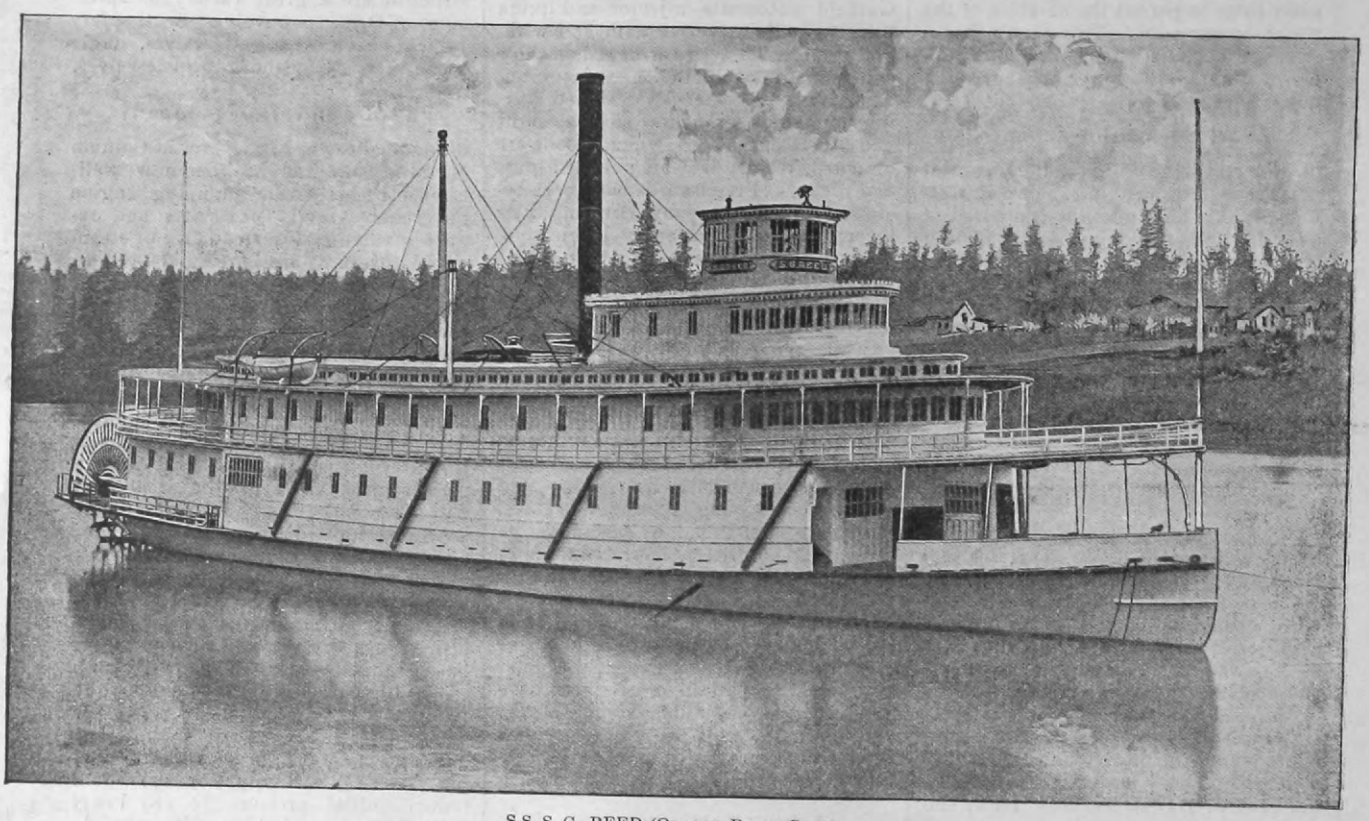
Many reflections are cast upon the plan of boiler and furnace in use on the boats under discussion; and no doubt to the outsider, who never stood over a steam boiler with 200 to 225 pounds pressure on it all day, the forms used seem very crude and wasteful of fuel; but the fact remains that, while many radical changes have been proposed and attempted, the result has generally been a speedy return to the accepted form.

In the first place, a furnace construction which will generate 90 or 100 pounds of steam working pressure with the greatest fuel economy will not generate 180 to 200 pounds with the greatest fuel economy; in fact, it usually will not generate the last pressure at all. Change of form is absolute, and ordinarily that form of furnace which makes the desired result with the least manipulation gives the best economy.

The plan of boiler most in use is the externally fired return flue type, shell 40 inches diameter, 24 feet long; two return flues 13 inches, sometimes 14 inches, diameter; shells 0.26 inch thick; flues 0.29 or 0.3 inch, when made in rings 24 inches long; rivet holes drilled, and longitudinal seams double riveted. This boiler receives certificates from the Government inspectors allowing, for 70,000 T. S., a maximum working pressure of 182 pounds, being one-sixth the ultimate bursting strain of the shell; but nothing has yet been devised to prevent the operators from exceeding this limit, and 200 to 225 pounds is frequently maintained.

There is always a disposition to do a little more work, particularly with towboats. The numerous pier bridges and dams placed in the river in recent years incite preparation to meet the demands in "running" them, and nothing comes nearer doing this than a "wad" of steam at the proper time. Fifteen years ago, with iron boilers of no defined tensile strength, 160 pounds was "big steam." Now the facts are as stated.

The evaporative duty of these boilers is about 7 pounds of water per pound of coal, and when compared, on a basis of the foot-pounds of work done per pound of fuel, show favorably with any water craft. The demand made upon boilers using the water of these silt-bearing streams is very heavy, and imposes conditions under which other forms, although possibly of better fuel duty, fail in points of service and steadiness.



Much indrect harm is done by a requirement of the supervising inspectors that a water space of at least 3 inches should be preserved between the flues and shell, and between the flues themselves. Previous to this enactment about 1½ inches of space was the practice. The men who made these boilers had always used a 14 inch flue in a 40-inch shell, and they knew no other proportions. As a consequence, in order to comply with the new law, they raised the flues in the shell sufficiently to secure the required 3 inches of water space, and thereby vastly diminished the steam space, as well as curtailed the surface for the elimination of the steam.

There is one other form of boiler almost as popular as the double flued. The shell, 42 inches diameter, contains six 8 inch flues, in two rows of three each, the one flue immediately above the other. This gives easy access to every part for cleaning and repair, and steams very well. One such boiler 18 feet long, 210 square feet heating surface, 20 square feet grate surface, is supplying two engines 10 inches diameter, 48 inch stroke, at an initial pressure of 170 pounds. The engines indicate an average of about 170 horse-power, and fuel consumption is 500 to 600 pounds per hour, or a result of 3 to 3½ pounds of coal per horse-power per hour.

Several cases of compounding have given a better result than this, but always at greater first cost, large additions in weight and cost for maintenance, and have generally been succeeded by direct high pressure in the next boat built by the same owners.

The large increase in working pressures of late years has demanded greater strength in the machinery and fastenings, and also in the hull construction, but the increase in weight has not been proportionate to the increased power developed, and the service has thereby been improved.

In a paper read before the American Society of Mechanical Engineers by the writer of this paper, and from which some

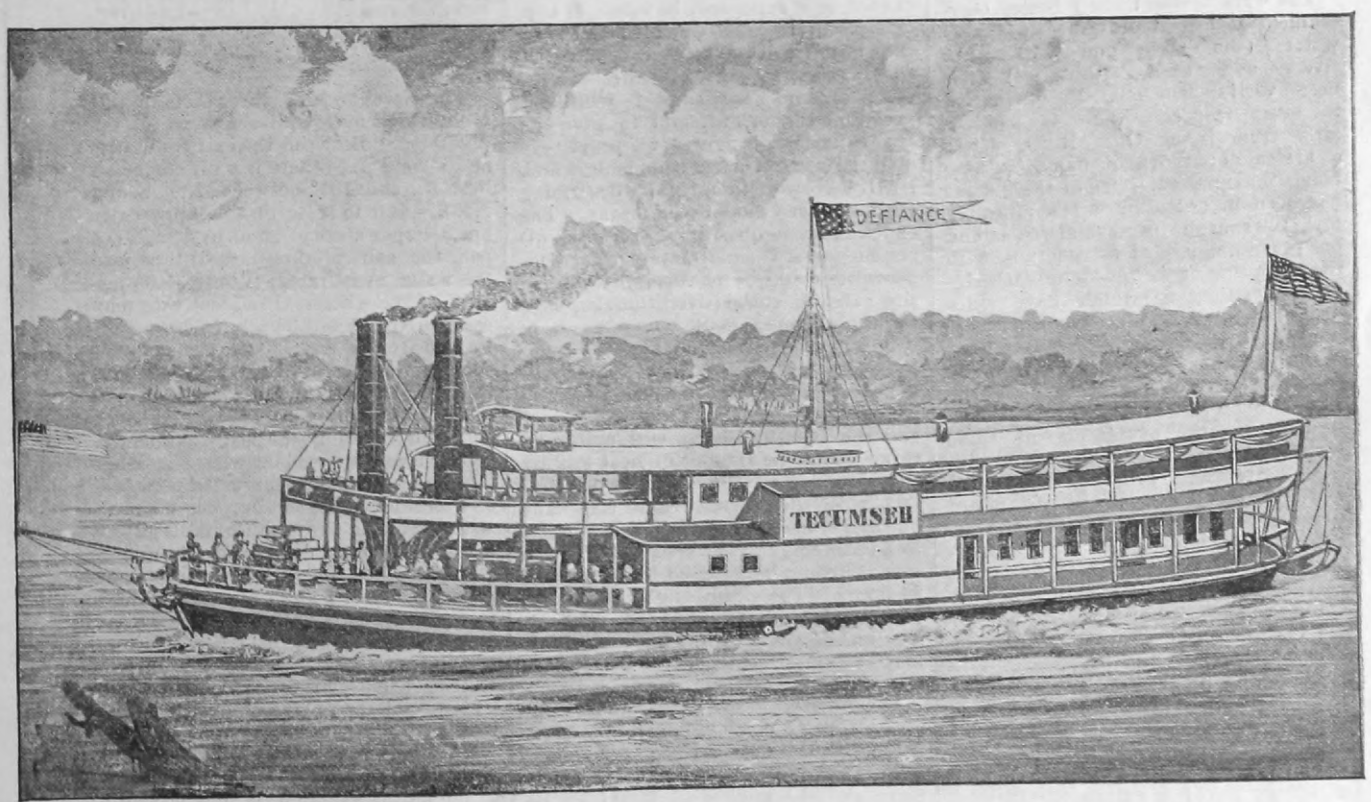
of the data herein are taken, an opinion was expressed that the improvement in the navigation of the Western waters of the United States would be found in the adoption of composite built boats, the frames and sides above the light draft line being of steel, the bottom and sides, up to the light line, of wood.



Since this opinion was given in the paper named several boats of this construction have been built, one by the writer, which has been entirely successful in general results, although open for future improvements in detail.

The mistakes, if any, have been in the direction of the use of too heavy steel for the frame construction. It has long been accepted as an axiom by Western boatmen that a stiff boat would not be so speedy under the same conditions as the same boat were she limber; but the results so far obtained by composite construction explode this idea entirely, speeds which have been obtained with the stiff construction being in every case better than with the limber boat.

Reference has been made to the fact that light construction is essential for this class of craft, and that in undertaking to develop an excessive amount of power, in proportion to the displacement or buoyancy of the boat, bad results have been obtained. For this reason the hull construction must be with a large number of dead flat frames in

order to preserve buoyancy. On some of the rivers of the Pacific Slope, especially the Oregon and Willamette, boats have been constructed on much better model and easier lines than any on the waters flowing into the Gulf of Mexico.

The accompanying engraving represents one of these boats, the "S. G. Reed," and gives some idea of the really fine lines found in them. This practice is possible with them through the use of timber which weighs between 25 and 30 pounds to the cubic foot, while the live oak used for boat building on the Ohio and Mississippi rivers and tributaries weighs between 60 and 70 pounds to the cubic foot.

The boat represented is very much stiffened by the use of fore and aft bulkheads through the hold, there being nine. These bulkheads are not in the way, because the load in this case is carried on the main deck. Such a practice with live oak would make the boat entirely too deep in minimum draft. The greater first cost for composite built boats over wooden boats is all that prevents their rapid introduction in the Ohio and Mississippi rivers, but it is to be hoped that this will not long stand in the way of their general introduction. There can be no question that the greater first cost is now justified in the long life and diminished cost of maintenance and repairs.

Not only is steel production diminished in cost, so that angles and shapes are coming into more general use for all purposes, and this increased output further assists to lessen the cost, but live oak timber is becoming less accessible, and is increasing in first cost.

It would seem that these causes ought soon to produce a result which would equalize the present cheapness of wood boats over composite boats at no distant date.

The work of the United States Government in the improvement of these waters (the Ohio and Mississippi rivers and their tributaries) has been vastly beneficial to navigation in every respect. This is particularly true of the Ohio River, where a system of movable dams is now being inaugurated. One of these dams has been in operation a few miles below Pittsburgh for several years, and has given unqualified satisfaction, with the exception of a few details in original construction, which have since been remedied. The second of these dams has now been authorized by Congress, and must necessarily lead finally to a complete system throughout the river. Such facilities will give a new impetus to the navigation of these waters, and an immense demand for increased tonnage will be the result. Through these means will no doubt come an intelligent improvement in respect to hull and machinery construction, with closer attention to fuel economy. The evolution is slow, but it is being evolved, and the time is not far distant when radical changes may be hoped for.

Since the preparation of this paper the writer is indebted to Capt. Ed. J. Howard, proprietor of Howard's shipyard, at Jeffersonville, Ind., opposite Louisville, Ky., on the Ohio River, for a photograph of the steamer "City of Hickman," and also for a photograph, made from a woodcut in Captain Howard's possession, of the steamboat "Tecumseh." Cuts of these boats are hereto appended, as indicating the change in dimensions and appearance between the two extremes of time, 1826 and 1892. The "Tecumseh" was built at Cincinnati, Ohio, in 1826; was a single engine boat, and had the sleeping accommodations for passengers in the hold. She was a celebrated boat at the time, because of the fact that she made the run from New Orleans to Louisville in something over eight days. The "City of Hickman" is the property of the Anchor Line, operating between St. Louis and New Orleans, and is a fine illustration of the excellent boats used in that service at the present time.

Utilizing the Waste Heat of Cinder.

Sir Lowthian Bell has placed before the Iron and Steel Institute some data relating to the experiments which he has been conducting at Clarence, to utilize the waste heat of blast furnace cinder for boiling brine. We quote from it as follows:

The recent experiments were undertaken to ascertain whether the heat in the exhaust steam and that in the slag, taken together, may not be suscepible of useful application. My experience so far does not permit me to estimate with sufficient precision the actual amount of the heating value of either. That of the steam will depend on how much, if any, of its latent heat remains in what, more or less, is not steam properly so-called, but is chiefly vesicular water. Of the heat in the slag, I have, by plunging it into water, ascertained that during the time occupied in running it into the wagons for ease of transport a considerable quantity of its original heat has disappeared, but this will be a varying quantity, according to the time which elapses between the slag leaving the furnace and being applied to do work. Under any circumstances, the temperatures obtainable for direct application cannot be very high, because the steam cannot, it is supposed, be much, if anything, above 100° C. (212° F.), and the heat in the slag can only be slowly extracted. In the present state of our knowledge I will not, because I cannot, attempt to give you any satisfactory figures to prove the quantity of heat at our command, which I will leave you to infer by describing what has been done by its means. The experiments in question have been directed toward ascertaining what temperatures could be obtained by passing the exhaust steam over the slag balls during a time, be it remembered, in which it was performing its work and by so much being cooled. This will depend, of course, on the relative weights of steam and slag employed, and the rapidity of the current of the former, and the amount of heat lost by the latter before it is exposed in contact with the steam. Eight slag balls on their respective wagons were placed in a chamber, and the steam of 16 to 20 tons of water was passed over them in 24 hours. The steam might be heated considerably above 500° or 600° F. Within the limits which necessarily it may be most convenient to observe in such a system of recovering heat otherwise lost, we must endeavor to apply it where possible to such purposes as can be served with heat of moderate intensity. Such an instance can, I think, be found in the industry recently established at Middlesborough—viz., that of producing salt from brine. It was, indeed, from experience at the Clarence Works in the evaporation of brine that the idea of utilizing the heat daily going to waste at the blast furnaces suggested itself. In order to ascertain the precise rate at which steam superheated in the way alluded to performed its work, three pans, each 25 feet long by 21 feet broad, were erected. Under the first, eight hot balls were placed in two rows, iron doors were then closed and the exhaust steam admitted into the two compartments occupied by the slag. The vapor, heated to about 500° F., passed into a space about 18 inches high, of the breadth of the pan, under the second vessel, and from it under the third. By the time it arrived at the end of this last pan it was frequently under the temperature of boiling water. There was still, however, heat enough passing into a small chamber in which a coil of small pipes was introduced, which served to preheat the brine before it was run into the pans. Through this the brine ran in a continuous stream at a rate just sufficient to make good the loss by evaporation. From this chamber a mere trace of vapor made its appearance at the outlet; indeed, occasionally there must have been an influx of air caused by a vacuum due to the perfect condensation of the steam. So far as the figures at my disposal enable me to calculate, a furnace producing 500 tons per week may be regarded as probably being able to evaporate a quantity of brine equal to about 75 tons of salt or perhaps more. Taking one month when the average temperature of the superheated steam left the three pans, it had, after performing its duty under each, the temperatures stated, while the brine it had heated stood at the figures given in the following table:

	No. 1 pan.	No. 2 pan.	No. 3 pan.
	Fahr.	Fahr.	Fahr.
Superheated steam at exit.	375°	212°	210°
Brine in pan.....	155°	149°	152°
Brine entering.....	198°	198°	198°
Proportions of salt obtained, per cent.....	35.96°	64.04°	=100°

There are two or three facts in this table which may require a word of explanation. Between the exit from first and second pans there is a difference of 163° F., and 165° between No. 1 and No. 3. But in spite of this apparently much larger absorption of heat in No. 1 pan, the salt produced, and therefore the water evaporated, is only 35.96 per cent. of the whole. Practically we may assume Nos. 2 and 3 each to have performed respectively 32.02 per cent. of the duty. Now, it is clear that whatever may have been the condition, in a calorific point of view, of the exhaust steam on entering the slag chamber, it has become, by contact with the slag, true steam of a very high temperature, and besides this has become charged with latent in addition to the sensible heat it contains. It is no doubt due to this latent heat being transferred to the brine that Nos. 2 and 3 pans are enabled to perform nearly as much work as the pan which is first in the series. It will be further observed that the brine, which enters at 198°, notwithstanding its constant absorption of heat from the steam passing under the pan, falls in temperature from 40° to 50° F. This is partly due to the cooling influence due to the act of evaporation, but probably still more to the fact that the experimental apparatus had no roof, and in consequence the surface of the brine was cooled by radiation and by the wind passing over its surface.

The Center Blast Tuyere Cupola.*

BY THOMAS D. WEST, SHARPSVILLE, PA.

The economy that is possible if two or more rows of tuyeres could only be made to force the blast to the center of the cupola and at the right elevation, caused me two or three years ago to give thought to the subject and to desire to get nearer the theoretical figure than present cupolas were doing if it could be possible.

One plan after another suggested itself until the idea of a center blast came to me. Having two cupolas in our shop, I thought I would experiment with the smaller, which is 40 inches inside diameter.

The experiment in this small cupola resulted so favorably that we concluded to try the plan in our large cupola in connection with the outside tuyeres, which we did after the plan illustrated by the cut herein shown. Before starting in to use this bottom center blast tuyere, we were not safe in trying to do better than one to seven or eight in fuel, as our metal came all from pig iron and had to "come down hot." With the combination of the center blast and outside tuyeres we found we could obtain hot metal with one to ten or eleven, and I would state that the one to ten and eleven iron was often much hotter than the one to seven or eight melted with the old process, and it would often come so hot it would take considerable scrap to cool it off before it would be wise to pour the metal. To say it would be as hot as stove molders would often care to use it would probably be the best way to convey an idea of its heat, and it might be well to state that the metal would be hotter at the end than at the beginning of the heat. The cupola men liked to use the device, as it made the work of chipping out and daubing up the cupola so much easier than in the old system, for in fact there would often be very little of such work to do. In my experimenting there were several plans tried, but the one recommended later on is the best and last one I am using with this system. It cannot but be evident that with such a plan the blast is conveyed to the center of the cupola or body of fuel, where it should be to achieve the greatest results, and if the theoretical point in perfect combustion is ever to be reached it will be by some such system. Not only does this plan save fuel, but also the lining of cupolas, while the present methods or principles now used for accomplishing economy in fuel do so at a sacrifice to the lining; so much as to make it in many cases a question if there is any economy in using "upper tuyeres."

A is an outside tuyere box made of ¼ inch wrought boiler plate, so as to make it light for dropping purpose. It is bolted only to one half or section of the "drop doors." C is a hinged cover having a hole for the bar cap supporter D. At E is a one and one quarter hole stopped by a little pivot swinging valve, so that if through the peep hole B any leakage should be seen, this valve could be swung back to let the metal or refuse run out. It will be noticed that the tuyere box A is made of a taper, so that should slag iron or refuse drop down into it, it could be readily relieved. The cylinder at F is made of an inner and outer ring of ¼ inch boiler plate. The space G is filled with fire clay. H shows angle iron, of which there are four pieces, for the purpose of supporting the round iron rings I. These and the angle irons are for holding and preventing the bagging of the fire clay, which is daubed on over them to protect the cylinder F from the melting heat of the cupola. This clay would be put on after the cylinder is placed in position inside of the cupola, and dried by the burning up of the bed. It would be the better plan to have two cylinders, so as to have one all the time on hand for drying in an oven. One heat gave us trouble through lack of care when half through by the metal getting through the clay to the iron rings. K is a clay cap having a cast iron prickered casting, as shown at M. The clay or ganister used for forming this cap K and daubing over the cylinder F should be of the best quality. The 1½-inch bar shown at D is in two sections, so as to enable its being pulled out before "dropping the bottom."

In cases where cupolas stand high the bar might often be worked in one piece, In placing the cap K on the cylinder my first plan was to let it rest down upon it and then after the blast was on and the iron commenced to melt the jack screw R would be raised, thereby lifting, of course, the bar H and the cap K to make any width of opening at S for the admittance of the blast that would be thought wise. The raising of this cap up against the pressure of coke and iron gave us trouble at one heat through breaking off of the clay at the outer rim of the cap, so that after the cast was about two thirds over the heat in the cupola had melted the casting M so as to cause a leakage down into the tuyere. We then tried another plan by letting the cap rest on three pieces of fire brick, one of which is seen at X, as done in the 40-inch cupola; these being equally divided, the blast would have ample room to find space for entrance between the top of the cylinder F and the cap K, as at S. In order to prevent the blast from entering this tuyere ere the iron commenced melting we used a damper, as seen at Fig. 2, which would be placed up in the cylinder F at a point about level with H and which consisted of a jointed bar the same as seen at D, having at its end a round piece of ½-inch boiler plate, as at O, having prickers riveted into it for the purpose of holding clay to keep the damper from getting hot and also bring the clay down when the damper would be removed or the blast allowed to enter the cupola. This arrangement, of course, did not require any jack screwing. We simply had the bar D protrude below the tuyere box cover G about 2 inches, so that a swinging catch attached to this cover supported the rod D, and in removing this damper we simply knocked the catch away and the damper fell down, bringing its clay with it. Of course, with this arrangement of damper, the center supports or guides P P for the bar D, when the raising plan was used, were removed. This plan was a decided improvement over raising the cap and worked all right. The reason for it not being desirable to admit the blast through the center tuyere ere the iron commenced to melt was, in the first place, to have the bottom outside tuyeres get the carbonic acid gas well started from the lower fuel before admitting oxygen to combine with the carbon oxide created in the fuel above the bottom tuyeres, upon the same principle that it is desirable to do so with upper outside tuyeres. In the second place, it greatly aids in preventing the tuyere hanging up when the bottom is dropped, with very large heats.

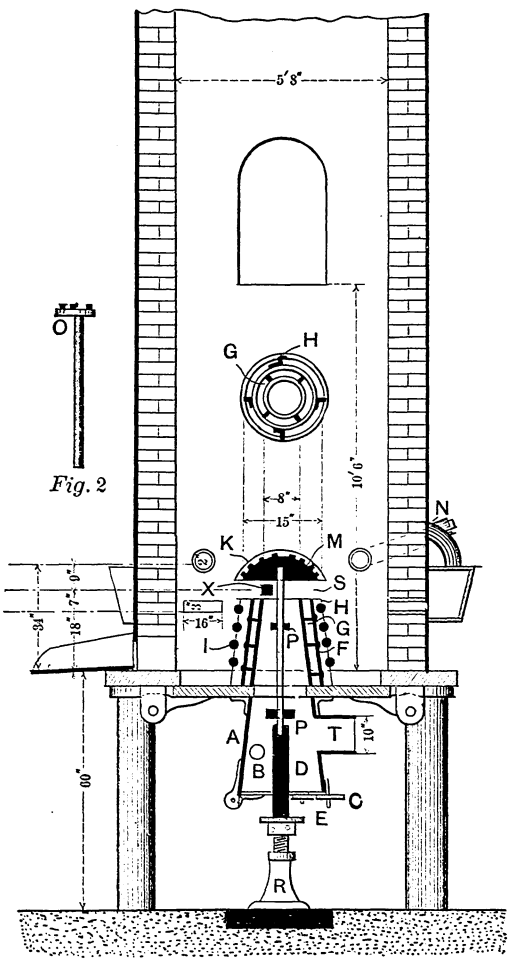

Fig. 2

THE WEST CENTER BLAST TUYERE.

The cap K, as shown, was made larger in diameter than the cylinder F, so as to prevent the dropping metal from falling or getting into the opening at S during the heat. It will be noticed that the point of entrance for blast at S is higher than the bottom outside tuyeres. This is done to achieve the end accomplished by upper outside tuyeres in admitting oxygen to combine with the carbonic oxide in turning it to carbonic acid gas, thereby making more complete combustion.

In making connections for the blast with the center tuyere box A, conditions will vary the plan to be adopted.

*From a paper read at the meeting, October 18, of the Western Foundrymen's Association.

Hosted by Google

The attachable pipe coming to this tuyere and connected at T should be an independent one coming directly from the main blast pipe, and not from any of the side tuyeres or wind boxes, and a damper should be arranged in this main side branch pipe so that the pressure of the center blast can be regulated independent of the outside blast. The cupola shown has 12 outside tuyeres, six of them being lower tuyeres 3 x 16 inches, and six of them upper tuyeres 2 inches in diameter. The width of opening for the center blast admitting of air was about 2½ inches. In "dropping the bottom" after very heavy heats we sometimes found that the center tuyere would hang up, but by a little rapping on its protruding end with bars it would come down, and leave a good "dump" or "bottom dropped cupola." In using this tuyere by itself or in combination with outside tuyeres it is essential in large heats to flux a cupola well and run the slag off. By letting slag remain in the cupola it readily chills around the tuyeres and thereby causes "bunging" or "hanging up," and it might be well also to state that the outside tuyeres should be kept well open so that the blast can find easy delivery to the end of the heat through them. At the start the blast should not pass through the center tuyere with any more force than necessary to counterbalance the inside wind pressure. The blast is delivered from a No. 9 Sturtevant fan.

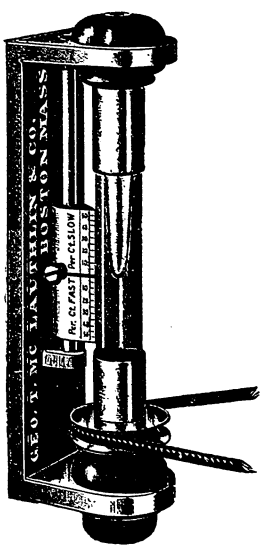
If this system should be adopted in cupolas that are to run steady over ten hours, like those at steel works, I would like to hear of some one trying the cylinder F (instead of as here shown), having it constructed of all fire brick, every other course being tied with a thin plate of boiler or cast iron, the edges of which standing back, so as to be protected by a covering of clay. These rings should not be over ⅝ inch thickness. The idea is to make sure of the heat not causing any cracks to occur in the brick tuyere or burn the edges of the rings while the blast is on. By well tying the brick work or "breaking its courses" it might stand well without the use of the iron rings. I have tried an all fire clay cylinder tile baked in a fire brick kiln, but it did not prove a success, as it was cracked and gave us trouble from leakage. For ordinary cupola work, I know that with care and judgment the plan here illustrated, and having two cylinders as above suggested, could be made to work successfully, and all who try it will find they can save fuel and the cutting of their lining. The latter with some firms is a very costly affair. Of course, in starting in to try this system one is not expected at the very first heat to charge with a radical change in using less fuel, but gradually trying less every heat until they find by trial just how low they can get. At the start you can at least depend on reducing the bed in bulk whatever the bulk of your center tuyere may occupy, and between charges have 20 per cent. less fuel. I know that in our 68-inch cupola we reduced the bed after trials from 3000 to 2100 pounds, and in charges from 900 down to 500. The iron we place on the bed is 8000 pounds, and between charges 6000 pounds, and, as stated in first part of paper, our heats run from 50 to 70 tons. We are still experimenting in this line, but as business has been so dull for the last three months, there has been but little opportunity to go ahead and compute the results.

A remarkable coincidence in this experimenting is that after I had been laboring with the new system, thinking the idea was alone with myself, a letter came from the far North showing that another foundryman was likewise experimenting—Thomas H. Widdowson of Mankato, Minn., who wrote me on this subject after I had been at work upward of a year.

In the discussion Mr. Widdowson stated that in his experiments the melting was faster and hotter. Mr. West made the point that the use of the center tuyere allows of using a lighter blast, and added the following detail to those contained in the paper: "The cupola I used for my experiments was 44 inches in diameter and I put in upper tuyers, about four of them, about 10 inches above the lower tuyeres. I found in experimenting that when the blast was cut off you could hardly get near the charging door. The men in charging would throw their iron in and jump back. We opened the upper tuyeres and the flame would die down." Mr. Widdowson and Mr. Moore agreed that founders usually use too much blast.

The Western Foundrymen.

The regular meeting of the Western Foundrymen's Association convened Wednesday evening, October 18, 1893, at 225 Dearborn street, Chicago, Ill., H. S. Holly in the chair. The secretary reported that in answer to about 50 letters which he had sent out to the different foundrymen, to find out what the feeling was on the question of establishing a laboratory and having a chemist, he had received letters from the following firms: The Edward P. Allis Company, Milwaukee, Wis.; Webster, Camp & Lane Machine Company, Akron, Ohio; Lane & Bodley Company, Cincinnati, Ohio; Rogers, Brown & Merwin, Chicago, Ill.; S. Obermayer & Co., Cincinnati, Ohio; Hurlbut Mfg. Company, Racine Junction, Wis.; South Milwaukee Malleable Iron Works, Milwaukee, Wis.; Walburn-Swenson Company, Chicago, Ill.; Joliet Stove Works, Joliet, Ill.



The secretary also made the following report: "At the last meeting the association also instructed the secretary to procure prices for the establishment of a laboratory and prices from chemists for taking charge of a laboratory. From informal inquiries I find it will cost $350 to $500 to equip a laboratory, and of course the rent of the room would be added to that, which, with the running expenses, would amount to about $200 to $250 a year, making a total of about $750 a year. I have received propositions from George Ellis of Chicago, R. N. Hubbard of Columbus, Ohio, and William Molin of New York, to do the work for the association, Mr. Hubbard offering his services for $1200 per year, Mr. Molin for $2000, Mr. Ellis proposing a price per determination and H. O. Chute a $1 rate, providing 25 members agree to take five determinations per month."

The question was debated at length by William Moore of the Joliet Stove Works, Mr. Gardner, Thomas D. West, Mr. Holly, H. O. Chute and others. It was moved and supported that the secretary be instructed to advise those from whom he had received bids that the association was not at the present time in a position to consider the matter of a common laboratory or common laboratory work.

The following applications were received for membership in the association and were unanimously elected: Connorsville Blower Company, Connorsville, Ind.; J. H. Williams, manager Manning, Maxwell & Moore, Chicago, and the Wrought Iron Bridge Company of Canton, Ohio. A paper was then read by Thomas D. West of Sharpsville, Pa., entitled "Progress in the Science of Melting in Cupola Construction," which, with a summary of the discussion which followed, we print elsewhere.

The McLaughlin Speed Gauge.

The accompanying engraving represents in one-quarter size a speed gauge which is entirely different from the usual speed or revolution counter. It is placed in a nearly vertical position and is run at about 3000 revolutions per minute by a small cord or by light friction. It can be placed in any location where motion can be conveyed to it. The standard speed point of the index plate is set at the point of the inverted air cone, and the upper lines indicate the per cent. slower, and those below the per

Speed Gauge.

cent. faster, than standard. The glass cylinder is not quite filled with liquid. As the cylinder is revolved the liquid is thrown to the sides by centifugal force and the bubble of air is extended down the center. At very high speed this bubble would assume the form of a perfect cylinder, and at lower speed would be cone shaped, the position of the apex or lower end of the cone being controlled directly by the speed. It is therefore evident that when properly adjusted the device will very accurately indicate the speed and will show, by the movement of the point of the cone, the slightest variations. This gauge is made by George T. McLaughlin & Co. of 120 Fulton street, Boston, Mass.

During a conference recently held between the operators and employees of a sheet rolling mill, the question of a 10 per cent. reduction in wages was being discussed. One of the workmen stated in effect that it would avail nothing if the concession was granted, as the manufacturers would immediately give the advantage to the consumer. "No, indeed," answered the manufacturer, "we cannot do that; if we do we must close our works; the consumer received that advantage long before we called you to this office to help us in our dilemma."

Hosted by Google

World's Fair Awards.

Copper and Its Alloys.

In Group 51, embracing copper and its alloys, the awards are:

Connecticut—Waterbury — Randolph & Clowes, three awards, collection of sheet copper and brass, collection of brazed brass tubes and moldings, seamless drawn copper tubes.

Massachusetts—Washburn & Moen Mfg. Company, Worcester, copper in ingots, bars and rolled alloys and products.

Maryland—Baltimore—Baltimore Copper Company, refined copper; Old Dominion Copper Company, display of copper ores.

Michigan—Calumet & Hecla Mfg. Company, Calumet, battery sands; Tamarack, Jr., Mine, Houghton County, copper bearing conglomerate.

Utah—Cactus Mining Company, Frisco, collection of copper bullion.

Grinding and Polishing Substances.

In Group 45, comprising grinding, abrading and polishing substances, the awards are:

Pennsylvania — Pittsburgh — Pittsburgh Crushed Steel Company, four awards, crushed steel, steel emery, putty powder, rouge; Tanite Company, Stroudsburg, emery, corundum tripoli, and rotten stone; the Carborundum Company, Monongahela, carborundum.

Missouri—American Tripoli Company, Carthage, Tripoli rock filter, disks and plates.

New York—Daniel Lynch, Minerva, N. Y., garnet (massive); Herman Behr & Co., New York City, flint, emery papers, pumice and rotten stone.

North Carolina—Dr. C. D. Smith, Franklin, collective exhibit of corundum.

Ohio—Ohio Grindstone Company, Cleveland, grindstones.

England—Beckmann & Co., London, emery wheels, slabs, files and hones.

Pumps, Engines and Mining Apparatus.

In Group 62, which comprises pumps, engines, and apparatus used in mining, for pumping, draining and hoisting, the following awards are made:

Illinois—Chicago—M. C. Bullock Mfg. Company, three awards, portable hoists, single and double drum, double cylinder, drums, winches and quarry hoists, Simplex gas engines; Chicago Iron works, hoisting engine for flat rope; Crane Elevator Company, two steam hoisting engines; Raymond Bros., wind motor; Fraser & Chalmers, three awards, collection of machinery and apparatus for the mining, reduction and smelting of ore, mining cage, single cylinder drum hoist, Riedler mining pump (deep); the American Well works, Aurora, sinking pump, double drum.

New York—New York City—Ingersoll Sargeant Drill Company, air head for rock drill, piston, cold air compressor; Rand Drill Company, high pressure air compressor; duplex straight line air compressors; Henry R. Worthington, four awards, Lehigh Mine pump, two central packed plunger pumps, one sinking pump, duplex plunger pump; Goulds Mfg. Company, Seneca Falls, deep mine pump.

Indiana—The P. H. & F. M. Roots Company, Connorsville, portable forges, blacksmith blowers, rotary force pump blowers, gas exhauster.

Missouri—Cookson Mfg. Company, Kansas City, Lewis patent rotary valve, duplex steam pumps.

Ohio—Leffel, James & Co., Springfield, water wheels, boiler and engines; Webster, Camp & Lane Machine Company, Akron, complete mining and hoisting machine.

Pennsylvania—Oil Well Supply Company, Pittsburgh, domeless boiler.

Scales, Weights and Measures.

For Group 112 of manufactures, including scales, balances, water meters, weights and measures, the awards are:

Illinois — Chicago — Fairbanks & Co., Standard scales, measures and weights, hopper, abbatoir, suspension, packing house, stock, platform, counter, railway track, weighmasters' beams, iron dealers' bullion, cloth, prescription, postal and bank scales, paper beams, automatic night register, general exhibit, and Fairbanks' automatic cement tester.

New York—Buffalo—Buffalo Scale Company, eight awards, combination beam for hay scales, Dormant, Columbian and Boston platform scales, fancy latch for platform scales, reverse acting meat beam, patent Boston market scales, patent testing machine. New York City—Springer Torsion Balance Company, scales and balances; Neptune Meter Company, water meters; H. R. Worthington, water, oil, molasses meters; Mogul Mfg. Company, three-spring scales; Springfield Scale Company, automatic druggists' prescription scales. Brooklyn — Thomson Meter Company, water meters; National Meter Company, water meters.

Ohio—Kirk & Bailey, Cincinnati, bicycle grindstones.

Massachusetts—Dorsey Mfg. Company, South Boston, water meters.

Pennsylvania—Metric Metal Company, Erie, spring scales; Henry Troemner, Philadelphia, counter scales.

Machinery.

Illinois — Chicago — Bishop & Babcock Company, air compressing and pumping appliances; H. W. Caldwell & Son, screw conveying machinery; Chicago Belting Company, leather belts; Chicago Raw Hide Mfg. Company, raw hide belting, raw hide rope, raw hide lacing; Chicago Fireproof Covering Company, steam pipe covering; Chapman Valve Mfg. Company, straightway valves, heavy union flanges recessed for lead, automatic indicator for sprinkler valves, fire hydrants; E. G. F. Colles & Co., upright pressure heater; Crane Elevator Company, freight elevating and hoisting machinery; Aermotor Company, pneumatic pump; Anti-Friction Metal Company, anti-friction metal; Andrews, Johnson & Co., fan engines; William Baragwanath & Son, steam jacket feed and water heater; Crane Elevator Company, horizontal and vertical double cylinder steam reversing engines; Crane Company, brass and iron valves and cocks for steam, gas and water, special hard metal valves and engine trimmings; Crane Company, screwed and flanged fittings; Dake Engine Mfg. Company, engines adapted for direct attachments to dynamos, pumps, fans and blowers; Dodge Mfg. Company, chain oiling bearings; Dodge Mfg. Company, special dynamo pulley, wood bushing system; Excelsior Heating Company, Excelsior open feed water heater; Exhaust Ventilator Company, exhaust fans for removing hot air and steam; Fraser & Chalmers, four cylinder triple expansion condensing Corliss engine, exhibited without condenser; Goodsell Packing Company, piston rod packings for steam and other joints, sheets and rings with and without wire cloth insertion, metallic piston rod packing; Globe Light & Heat Company, machine for the manufacture of gas from gasoline for fuel and illuminating; Hawley Down Draft Furnace Company, down draft furnace; Hayes Pump & Planter Company, hand power pump; Frank Hennebohle, pressure valves; Jewell Filter Company, filter; H. W. Johns Mfg. Company, Chicago and New York, asbestos packings and coverings, vulcabeston, consisting of sheets, gaskets, rings and special forms used in connection with electrical locomotives, other machinery; I. F. Kearns & Co., pop safety valves and relief valves; W. H. Lahman, Lahman-Kirkwood shaking and dumping grate bars; Liquid Carbonic Acid Company, carbonating machinery; Link Belt Machinery Company, transmission of power by manila rope; Charles Munson Belting Company; leather belting; National Supply Company, fuel oil burner; George E. Nye, steam vacuum pumps; Olmstead & Co., drive well points; Rice & Whitacre, reversing engine; Rice & Whitacre, hot water and steam heating boilers and Kriebel engine; J. A. Roebling's Sons Company, sheaves and cables for transmission of power; Stirling Company, water tube steam boilers; Stillwell-Bierce & Smith-Vaile, open feed water heater; Stillwell-Bierce & Smith-Vaile, live steam purifier; Charles A. Schieren, perforated leather belting; United States Car Company, shafting; Webster Mfg. Company, gas engines, rubber belt conveyors and perfected arrangement for driving pulleys by endless ropes; Cortez F. Wilson, oil tanks with pump; Warren, Webster & Co., Williames vacuum system of steam heating and Webster vacuum feed water heater and purifier; George H. Hitchcock, Danville, adjustable stuffing box; Bates Machine Company, Joliet, Bates Corliss engines; American Well Works, Aurora, collection of pumping and well appliances.

New York—New York City—Abendroth & Root Mfg. Company, special riveted pipes; Abendroth & Root Mfg. Company, sectional water tube boiler; American Leather Link Belt Company, leather link belting; Babcock & Wilcox Company, model water tube boilers and details; Ball & Wood Company, high speed engines; Cameron Steam Pump Works, pumps; Consolidated Safety Valve Company, valves; Conover Mfg. Company, independent steam engine condenser; Lidgerwood Mfg. Company, hoisting engines for mine or contract service, bridge erection and in the operation of wire rope tramways; C. W. Hunt Company, steam engines, governors for steam hoisting engines; Ingersoll-Sargeant Drill Company, air compressor; Knowles Steam Pump Works, double acting triplex pump; New York Safety Steam Power Company, automatic cut off engine; Rider Engine Company, hot air pumps for supplying water to residences, hotels, &c.; Willman Brothers, automatic continuous "spray system" carbonating apparatus; Westinghouse, Church, Kerr & Co., upright tandem compound engines, single action high speed compound engine, collective exhibit of steam engines, steam loops; Wheeler Condenser Company, surface condensers; L. J. Wing & Co., "Wing's" disk fan; Henry R. Worthington, marine feed water heater, large check and foot valves for water works purposes, air compressor and beer racking pump; James R. Floyd & Sons, Ogden quick moving valve for gas mains, self sealing mouthpiece, valve indicator; Fuel Economizer Company, flue heater to heat feed water for boilers; John Mathews Apparatus Company, carbonating machinery; New York Belting & Packing Company, rubber belting, display of rubber packing, gaskets, balls, rolls, hose and tubing; Henry R. Worthington, horizontal triple expansion engine, four cylinder vertical triple expansion engine, vertical compound engine, underwriters' fire pumps, low duty pumps, Admiralty feed pumps, automatic feed pumps, wrecking pump, independent jet condenser and pumps, pressure pumps for mining and elevator service, ammonia pump, duplex water motor, steam accumulator combined with duplex pump, general exhibit of pumping machinery. Brooklyn—Clonbrook Steam Boiler Works, boilers; Conrad Carlson, platform and hod elevator; M. T. Davidson, compound boiler feed pumps. Buffalo—Lake Erie Engineering Works, 1000 horse-power vertical compound engine; National Meter Company, gas engines; Buffalo Steam Pump Company, steam pumps; Yawman & Erbe, Rochester, exhibit of bottle washing and rinsing machines, trucks and tanks; B. W. Payne & Sons, Elmira, improved Corliss engine; Goulds Mfg. Company, Seneca Falls, triplex power pumps for boiler feed; Electric Pipe Bending Company, Harrison, round, flat, oval and special forms of pipe coil; E. C. Fasoldt, Albany, air compressors for physicians' use; Eddy Valve Company, Waterford, straightway valves for water and steam, fire hydrants.

Massachusetts — Boston — Ashton Valve Company, pop safety valve; Hancock Inspirator Company, inspirators for feeding steam boilers; Hersey Mfg. Company, rotary pumps; A. D. Puffer & Son, bottling machinery, soda water apparatus; Tripp Metallic Packing Company, metallic packing for piston rods and valve stem; James W. Tufts, corbonating machinery; Wainwright Mfg. Company, surface condenser and feed water heaters; Walworth Mfg Company, brass and iron valves, cocks and fittings for steam, water and gas, sections of Mills' sectional cast iron boiler. Worcester—Washburn & Moen Mfg. Co., apparatus for the transmission of power; Otis C. White, adjustable expansion movement in ball and socket joints as applied to machinery.

California—San Francisco—Golden State & Miners' Iron Works Company, steam engines; Pelton Water Wheel Company, Pelton water wheel.

Colorado — Davis-Creswell Mfg. Company, Denver, plumbers' and steam fitters' supplies.

New Hampshire—Concord—Page Belting Company, link and leather belting.

Louisiana—New Orleans—Joseph Menge, centrifugal lift pump for lifting water in huge volume; Henderson, Thoans & Gordes, absorption ice and refrigeration machine.

Maryland—Baltimore—Gandy Belting Company, stretched cotton duck belts, Zell improved water tube safety boilers.

Michigan—Battle Creek Machinery Com-

Hosted by Google

pany, Battle Creek, Marsh steam pump; Shaw Electric Crane Company, Muskegon, electric traveling crane; Union Mfg. Company, Battle Creek, steam boiler feed pumps and artesian or deep well pumps.

Minnesota—St. Paul—American Hoist & Derrick Company, contractors' machinery; James Boyd, hand and horse power hoists and elevators.

Missouri—Heine Safety Boiler Company, St. Louis, safety water tube steam boilers.

New Jersey—New Brunswick—National Iron Works Company, rocking and dumping grate; National Water Tube Boiler Company, water tube boilers and standard rocking grate bars.

Connecticut—G. H. Bushnell & Co., Thompsonville, filter presses; J. F. Case Engine Company, New Britain, 20 horse-power engine; Hay en & Derby Mfg. Company, Bridgeport, injectors; National Pipe Bending Company, New Haven, National feed water heater; Yale & Towne Mfg. Company, Stamford, differential pulley blocks, screw blocks, safety double lifts, pillar cranes, safety hoisting winches, crabs, sustaining tripods, electric traveling crane.

Indiana—Anthony H. Bryan, Evansville, automatic hot and cold water elevator and distributor; Flint & Walling Mfg. Company, Kendalville, pumps; Reeves Pulley Company, Columbus, wood split pulleys; South Bend Pulley Company, South Bend, wood split pulley.

Iowa—Red Jacket Mfg. Company, Davenport, force pump; Sioux City Engine Works, Sioux City, Sioux City Corliss engine.

Ohio—Cincinnati—J. H. McGowan & Co., general exhibits of pumps, &c., back pressure valves, gate valves, sprinklers, hydraulic tobacco machine; William Powell & Co., eight feed lubricators and engine grinding valves; Laidlaw & Dunn Company, pumping machinery.

Buckeye Iron & Brass Works, Dayton, high pressure improved hydraulic power pump, brass valves and fittings, iron body valves; Cleveland Faucet Company, Cleveland, pumps; Deming Co., Salem, rotary and other pumps, hand piston pumps, hydraulic rams, well digging tools, hydraulic pumping motors; Hoppes Mfg. Company, Springfield, live steam feed water purifier, exhaust feed water heater; Falls Rivet & Machine Company, Cuyahoga Falls, ring oil bearings, friction clutch, couplings for driving pulleys; Jeffery Mfg. Company, Columbus, chain elevators; Morgan Engineering Company, Alliance, steam hammer, overhead traveling crane; Brass & Iron Works Company, Fostoria, gate valves, pipe fittings; Buckeye Engine Company, Salem, simple engines, medium speed, high speed, tandem compound, cross compound condensing, triple expansion four cylinder condensing engines, exhibit of an engine cut away through cylinder, steam chest and valves; Norwalk Iron Works Company, South Norwalk, air compressors; Vulcan Brass Company, Cleveland, hydraulic and hand pressure beer pumps and faucets.

Pennsylvania—Philadelphia—Alexander Bros., leather belting; Hugo Bilgram, smooth running glass; Otto Gas Engine Works, Otto gas engine and gasoline engine; L. Schulte & Co., injectors, steam jet system pumps, jet pump, artesian well system pumps, hydraulic valves, steam trap, automatic eductor and plain eductor, exhaust steam induction condenser; William Sellers & Co., electric traveling crane injectors, Rick bottle cleansing machine, bottle washing and rinsing machine in combined operation; R. D. Wood & Co., Philadelphia, Camden valve and turbine wheel. Pittsburgh—Oil Well Supply Company, Mogul stationary engines, exhibit of brass and iron valves and fitting for Klein & Lays patent pipe line tongs; Phœnix Iron Works Company, Meadville, Dick & Church tandem compound engine. Erie—Jarecki Mfg. Company, Limited, exhibit of brass goods and iron fittings; Stearns Mfg. Company, automatic high speed engine, Gill water tube boilers; Z. A. Watson, Excelsior boiler feeder; Ball Engine Company, 500 horse-power cross high speed compound condensing engine; Bethlehem Iron Company, South Bethlehem, propeller shafts and model of 125-ton steam hammer; A. B. Farquhar Company, Limited, York, 75 horse-power Corliss engine. Waynesboro—Frick & Co., ice making and refrigerating machinery, portable boiler and steam engine. Harrisburg—Harrisburg Foundry & Machine Company, Ideal tandem compound engine; Keasby & Mattison Company, Ambler, pipe covering; J. H. McEwan Mfg. Company, Ridgeway, tandem compound steam engine; Boyts, Porter & Co., Connellsville, single direct acting steam pump; Cyrus Chambers, Jr., Overbrook, model of steam engine made of silver and gold; Downie Pump Company, Valencia, artesian well pumps.

Rhode Island—Providence, Mason, Volney & Co., hoisting machinery, friction clutches; Providence Steam Engine Company, compound steam engine.

Vermont—Montpelier, L. P. & D. Transmitter Company, system of transmitting power.

Virginia—Cardwell Machine Company, Richmond, exhibit of pumps.

West Virginia—Charles Ward, Charleston, water tube marine boilers.

Wisconsin—William Wenzel, Appleton, Converse centriful pumps; Williams Engine & Clutch Works, Beloit, friction pulley; Otto Zwietutch, Milwaukee, carbonating and bottling machinery, seamless portable steel fountains.

In Group 50, comprising aluminum and its alloys:

Joseph M. Hirsch, Chicago, electroplating of aluminum upon iron, zinc, copper, wood; Deutsch Oesterrich Mannes Rhorer, Berlin, Germany, seamless Mannesmann pipes of aluminum.

Boring and Drilling Tools, &c.

In Group 61, for boring and drilling tools and apparatus for breaking ore and coal, the following awards were announced:

Illinois—Chicago.—Eugene Moreau, rock drilling tools; M. C. Bullock Mfg. Company, drills, drilling machinery, Gadder heading machine, Stine-Smith mining machine, Mitchell long wall machine, rock drills; F. C. Austin Mfg. Company, portable rock drilling machine, steel jetting well; Sullivan Machine Company, swivel head channel, drilling machinery; American Well Works, Aurora, well boring, jetting and drilling machine, well auger; Peoria Coal Drill Works, Peoria, coal cutting and mining machine.

Ohio.—Beal's Mining Core Drill Company, Elyria, core drills and tools; Star Drilling Machine Company, Akron, drilling machines; Jeffrey Mfg. Company, Columbus, electric coal mining machines, electric rotary coal drill and ironclad motor, air power rotary coal drills.

New York—John Suydam, Albany, metal flexible joint; Rand Drill Company, New York, rock drills and Derby bit; The Ingersoll Sargeant Drill Company, New York, adjustable tunnel column, clamp and crescent, battery; Ingersoll-Sargeant Drill Company, New York, drills and coal mining machines.

Iowa—Morgan, Kelly & Taneyhill, Waterloo, well-drilling machinery.

Pennsylvania—Oil Well Supply Company, Pittsburgh, well drilling tools, machinery and apparatus, working models, and drilling rigs.

Munitions of War, &c.

In the Department of Manufactures, Group 113, the following awards were announced for munitions of war, weapons, &c.:

Connecticut—Winchester Repeating Arms Company, New Haven, four awards, for small arms, military, sporting and hunting fire arms, ammunition, cartridge reloading implements; Ideal Mfg. Company, New Haven, four awards for implements for reloading cartridges, shells for rifles, pistols and shot guns, powder flasks, bullet molds; Bridgeport Gun Implement Company, Bridgeport, three awards for gun implements, Foster auger bits, loading machinery of all kinds; Parker Bros., Meriden, breech loading shotguns; Colt's Fire Arms Mfg. Company, Hartford, fire-arms; Union Metallic Cartridge Company, Bridgeport, metallic ammunition; the Marlin Firearms Company, New Haven, sporting and hunting firearms.

New York—Burgess Gun Company, Buffalo, N. Y., sporting and hunting firearms; Francis Baumerman, New York, two awards for repeating shotguns and rifles and riot guns; Lefever Arms Company, Syracuse, N. Y., automatic hammerless guns; Remington Arms Company, Ilion, N. Y., military and sporting firearms.

Smith & Wesson, Springfield, Mass., revolvers.

Louis Jordan, Chicago, Ill., sporting and hunting guns, hand made.

Illinois—Chicago—American Screw Company, heading machine, threading machine; Vulcan Iron Works, drop hammers and pile caps; Charles H. Besley & Co., oil cups; Crane Company, pipe tools; Capitol Mfg. Company, Adams automatic bolt threading machine, Cook universal die adjusting automatic bolt threading machine, Capitol combination pipe and rod threading and cutting off machine, Cook full automatic nut tapping machine; Canedy Otto Mfg. Company, blowers and forges, drills, screw plates, pincers and clamps; Farquhar Heating Company, hand riveting machine; International Steel Post Company, machine for making metallic fence posts; A. J. Oehring, multiple drilling machine; John E. Walsh, gasoline torches for soldering and brazing; Yankee Machine Works, twist drill grinder for drill grinders; W. F. & John Barnes Company, Rockford, drilling machines and iron and wood working machinery.

New York—Brooklyn—E. W. Bliss & Co., power presses, seaming machines and gang slitters; J. H. Williams & Co., forgings and wrenches; Stiles & Parker Press Company, punching presses and drop hammers; Merrill Bros., drop hammers; Capital Machine Tool Company, Auburn, quick-acting vises; Gleason Tool Company, Rochester, Gleason engine lathes. Buffalo—Keystone Mfg. Company, patent nonpareil wrenches; Niagara Stamping & Tool Company, machine tools. Manning, Maxwell & Moore, New York, machine tools and machines for working metals; D. Saunders Sons, Yonkers, machines for cutting and threading pipe; Westcott Chuck Company, Oneida, scroll and drill chucks.

Ohio—Cleveland—Bardon & Oliver, Monitor lathe for brass work; Cleveland Twist Drill Company, machine tools; Acme Machinery Company, threading machines; Standard Tool Company, exhibit of twist drills, fluted drills, reamers, drill sockets, arbors, mandrels, taps, milling cutters, chucks, gauges, screw driver bits; VanWagoner & Williams Company, wrought steel vises; Warner & Swasey, machine tools and process for arranging and cutting the teeth of spur wheels.

Hamilton—Niles Tool Works Company, turret head screw machine, exhibit of iron working tools, heavy machine tools; Long & Allstatter Company, boiler sheet and horizontal punching machine, multiple punching machine, angle iron punching machine. Dayton—Buckeye Iron & Brass Works, power feed turret forming lathe, automatic hexagon milling machine; National Machinery Company, Tiffin, bolt cutting, heading and tapping machines; Lodge & Davis Machine Tool Company, Cincinnati, machine tools; Christy Knife Company, Tremont, machines for manufacturing knives; Brass & Iron Works Company, Fostoria, tapping machine; Wells Machine Works, Toledo, combined arrangement for threading and cutting pipes.

Pennsylvania—A. Falkenau, Philadelphia, machine tools, power tool grinder; Jarecki Mfg. Company, Erie, pipe cutting machinery combined with engine; Newton Machine Works, Philadelphia, cold sawing machine; R. D. Wood & Co., Philadelphia, hydraulic machinery, shearing, punching and riveting machinery, lifting apparatus for riveting.

Connecticut—Hartford—Billings & Spencer Company, machinists' tools and drop forgings, box opener; Pratt & Whitney Company, collection of machine tools, standard measuring machines and standard gauges, miscellaneous small tools for machinists' use; A. D. Quint, turret drill. Southington—Peck, Stow & Wilcox Company, tinsmith tools, bench tools, meat cutter, and machine for cutting and folding tin. Bridgeport—Armstrong Mfg. Company, pipe threading machinery; Curtis & Curtis, thread machine, die stock; Hendy Machine Company, Torrington, planers, engine lathes, pillar shapers; E. Horton & Sons Company, Windsor Locks, chucks; Charles Parker Company, Meriden, machinists' vises.

Delaware—Wilmington—Hilles & Jones Company, shears and punches, No. 4 plate planing machine and No. 4 vertical milling machine.

Massachusetts—Boston—American Tool Company, brass finishing lathe and oil separator; George H. Eaton & Co., power presses; Walworth Mfg Company, machine for tapping street main under pressure. Hyde Park—Brainard Milling Machine Company, No. 12 and 14 tool room milling machine, No. 1, 3, 4½ standard universal milling machine, upright plain milling machine, horizontal plain milling machine, long feed milling machine, can cutting machine, small milling cutter grinder, gear cutting machine; Hurlbut, Rogers Machine Company, South Sudbury,

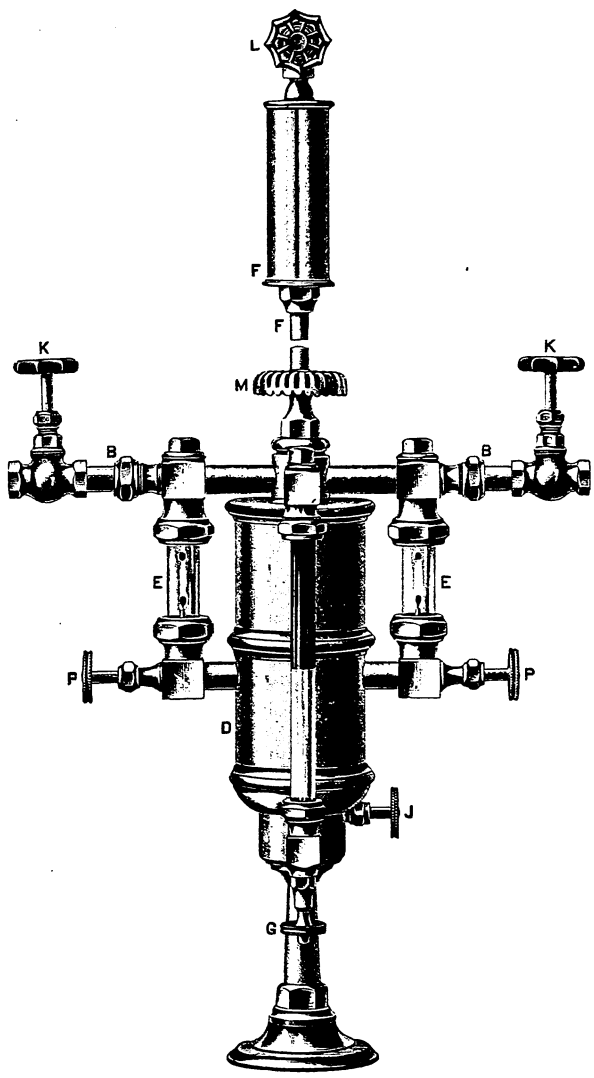
Hosted by Google

cutting off and centering machines; Morse Twist Drill Machine Company, New Bedford, twist drills, taps and dies, milling cutters, reamers and chucks; Prentice Bros., Worcester, screw cutting engine lathes and upright drilling machines; John Stark, Waltham, lathes.

Colorado—Wiswall & Davis, Longmont, automatic blacksmith foot hammer.

Maryland—Detrick & Harvey, Baltimore, open side planers.

Michigan — Fox Machine Company, Grand Rapids, shapers; Leland, Falconer & Norton Company, Detroit, double grinders with patented watering devices; Morton Mfg. Company, Muskegon Heights, key way cutters.



New Hampshire—Nashua—Flathers & Co., screw machine, screw cutting engine lathes, planing machine and hand reaming machines.

Refrigerators and Hollow Ware.

Illinois—Chicago—Wickes Refrigerator Company, tile lined refrigerator room; Vienna Enamel Stamping Company, three awards, enameled steel ware, kitchen utensils, wainscotings; Belding Mfg. Company, household, grocers' and butchers' refrigerators; Paul Dalmicks, four awards, butchers' supplies, ice box, counter, block, meat sack; G. M. Shirk Mfg. Company, refrigerators, cabinets; Adams & Westlake, cans; D. R. Sperry & Co., Batavia, four awards, kettles, farm boilers, caldrons, drug mortars.

Indiana—Summit Refrigerator Company, Michigan City, refrigerators and sideboard refrigerators; Fred A. Wilke, Richmond, portable china kilns for firing decorated china and glass.

Ohio—Wagner Mfg. Company, Sidney, nickel plated cast iron ware.

THE SEIBERT DOUBLE SIGHT FEED LUBRICATOR.

New Jersey—Trenton—Clark, Fisher & Co., anvils, vises, and anvils and vises combined; Ferracute Machine Company, Bridgeton, cutting presses. Newark—Chas. Sloan & Co., small bench lathes and attachments; Gould & Eberhardt, combination drill and tapping press; new type gear cutter. Plainfield—Pond Machine Tool Company, lathes and boring machines, 42-inch car wheel or tire lathe for turning tires on their own axles, planers.

Rhode Island—Providence—Beaman & Smith, heavy standard milling machine, No. 2 standard drilling and boring machine, No. 1 horizontal spindle drilling and boring machine; Brown & Sharpe Mfg. Company, universal milling machine, exhibit of machine tools, universal grinding machine; Darling, Brown & Skarpe, tools for accurate measurement; J. M. Carpenter Tap & Die Company, Pawtucket, taps and dies.

Wisconsin—Gisholt Machine Company, Madison, turret lathes, tool grinding machines, machine tools.

Connecticut—Chapman Mfg. Company, Meriden, four awards, hardware specialties, silver, gold and nickel tea bells, sleigh and telephone bells, dog collars.

Wisconsin—Otto Zuietusche, Milwaukee, onyx and marble soda water fountain, sundry supplies; Wisconsin Refrigerator Company, Eau Claire, refrigerators and sideboard refrigerators; Jacob J. Volhath Mfg. Company, Sheboygan, enameled cast iron ware and sheet iron ware.

Michigan—Grand Rapids—Grand Rapids Refrigerator Company, refrigerators, sideboard refrigerators; John Matthews Company, refrigerators; Alaska Refrigerator Company, Muskegon, three awards, refrigerators, ice chests, beer cooler; E. T. Barnum, Detroit, vases; Mrs. M. M. Harris, Detroit, refrigerator, the "M. M. Harris."

Pennsylvania—Griswold Mfg. Company, Erie, five awards, cast iron hollow ware, store furniture, house furnishing goods, cuspidors, post boxes; Charles Lippincott & Co., Philadelphia, soda water apparatus.

Massachusetts—Boston—A. D. Puffer & Sons, soda water apparatus and all appliances; Smith & Anthony Stove Company, kettles; James W. Tufts, Chelsea, soda water apparatus and appurtenances; the Low Art Tile Company, art tile soda fountain, soda fountains: Paul J. Daemicke, Butcher Boy cooling room; Wolf, Sayer & Heller, butcher cooler; National Key Opening Can Company, key opening can.

Minnesota—The Hurd Mfg. Company, Duluth, refrigerators.

New York—Northern Refrigerator Company, refrigerators and all fixings; Iron Clad Mfg. Company, tinned, galvanized and enameled household or kitchenware, steel soda fountains, rotary ash sifters, utensils, cold handles, soda fountains, enameled sheet metal ware.

Maryland—Keen & Hagerty, Baltimore, tinned, stamped and japanned ware.

The Seibert Double Sight Feed Lubricator.

This lubricator, made by the Seibert Cylinder Oil Cup Company of 53 Oliver street, Boston, Mass., is intended for compound and other engines, and is made with special reference to the use of heavy oils. It is furnished with short, large sight feed glasses, and a long glass in front for showing the hight of oil in reservoir or oil cup. At the bottom of the sight feed glasses there are valves, P P, placed to shut off the oil feed in case the glass gets broken. The condensing pipe A and the discharge pipe B being connected with the steam pipe C, the pressure in both pipes is equal, but the steam entering pipe A condenses and fills pipe F with water, and the weight of this column of water causes the oil in the reservoir D to pass out through pipe B, and thus into the steam pipe, as fast as the water from pipe F is fed into the reservoir by valve J. The oil forced from the reservoir passes down through a tube from the top of the reservoir to the bottom of the sight feed glass, and is there discharged into the water with which the glass is filled, and can be seen as it passes to the cylinder, rising drop by drop through the water. The quantity of oil being used is thus seen at a glance and the feed regulated. The oil is fed in just the quantity needed continuously, and passing into the steam pipe vaporizes and lubricates all of the internal parts of the engine.

The Philadelphia Warehouse Company report a falling off in their business with the iron trade, owing to the general depression and the curtailment of production. A leading feature of their business has been the storing or warehousing of iron, either in the pig or manufactured, as collateral for advances made by them. Under their plans storage is provided in any section at cost price, so that holders may have the advantage of pecuniary assistance with cheap storage, on a margin which will not advance the price of the material to an unreasonable extent.

A steamship of a new type arrived in the port of Philadelphia a few days ago from England. She is the British steamer "Mexican Prince," built at Wallaend, England, and arranged on a convertible principle, whereby the vessel is enabled to carry general or liquid cargoes at very short notice. She has every requisite for loading and discharging any class of products that would ever require conveyance across the sea.

Anti-Friction Ball Bearings.*

BY GEORGE F. SIMONDS.

The fundamental principle on which balls are now used in bicycles is not correct. In the present style of bearing :

1. The balls are loose and must be handled singly.

2. Each ball is required to sustain both the weight and end thrust.

3. But two rows of balls can be used, one row at each end of the bearing.

4. On account of the principle on which it is constructed the balls and bearing surfaces wear away.

5. There must be a means of adjustment on account of this wear.

In the double cage bearing these conditions are reversed. The balls are confined in cages, and readily and safely handled ; one set of balls carries the weight, while another set takes the end thrust ; any required number of balls can be utilized; properly made, there is practically no wear, and as there is no wear of the parts no adjustment is necessary.

The statement that there is practically no wear to a ball bearing when designed and constructed on the correct principle will undoubtedly be questioned, but as long use shows no change in the measurement of the size of the balls and bearing surfaces, and as the oil with which they are lubricated is not materially discolored, the claim would seem to be justified.

The bevel cage bearing was originated to take the place of the present style of bearing for light work only, for utility and for economy in construction. It is superior to the present style of bearing, in that the balls are carried in cages, and that they run on plane bevel surfaces in place of grooved bevel surfaces. The bevel cage bearing will come into use where the work is very light and where the greatest economy in construction is necessary. The double cage bearing will be generally adopted in those classes of vehicles and machinery where the best is wanted, and economy in use and permanency are in demand.

In subsequent remarks on the bearings themselves reference is made to the double cage bearings only; in the manufacture of the bearings, to double and single cage bearings.

The shafting and parts of the machinery in a small manufactory were started on these bearings in August, 1891, and have been in constant use since. Several carriages have been mounted on them, and a brougham so constructed has been on the streets of this city for the past 30 days. A street car constructed with bearings with $\frac{3}{8}$-inch balls, after constant use for five months, 16 hours per day, showed no wear whatever. Balls that were applied between plane surfaces under heavy pressure measured the same at the end of four years as when first put at work. Several bicycles, ridden constantly for two seasons, developed marked superiority over the old construction. Many instances can be cited showing the practicability and value of the bearings.

When the proper principles for the bearings had been discovered, and the designs perfected, but a beginning had been made looking to their general introduction. A ball bearing, to be of lasting commercial value, must be absolutely accurate and reliable. Perfect spheres were indispensable, and they had never been commercially produced, and the balls and bearing surfaces were required to be of a temper always uniform and reliable, and by no known processes could these results be attained. A small shop was erected in which a force of skilled men have been employed for the past 20 months, and steel balls are now made of absolute sphericity, alike one with another, and with great economy, and a system has been developed for making tempered articles uniform in quality, with a great saving in cost over existing methods for doing similar work. The accuracy and efficiency of the new system of making spheres will be appreciated when it is stated that balls $\frac{1}{8}$ $\frac{1}{32}$ and $\frac{1}{64}$ inch in diameter have been ground from pieces of steel, cylindrical in form, so that they do not vary $\frac{1}{10000}$ inch from perfect spheres or from each other in size.

As the patents covering these various processes and devices are not yet all issued, detailed descriptions must in some cases be withheld, but enough can be made known to convey a general idea.

The new system for making tempered articles is covered by a series of patents under the following titles:

The metallurgical furnace.

The tempering oven.

The double bath hardening process.

The process for hardening rings and sleeves.

By this system Bessemer or open hearth steel is used, carrying about ten points of carbon and costing from 2 to 3 cents per pound, in place of machinery or tool steel, carrying from 30 to 150 points of carbon, and costing from 6 to 16 cents per pound.

By the ordinary hardening process, the quick cooling of a tool made of high carbon steel throughout causes warping and breaking, and has been a source of untold trouble to workers of steel for all time. It is customary in hardening, when the tool needs to be very hard, to cool the article in water or brine, which cools quickly; this secures the desired hardness, but the sudden cooling sets up unequal strains throughout the article, causing the warping and breaking. When extreme hardness is not required, or when an article cannot safely be dipped in brine, it is cooled in a slow cooling medium, like oil. This hardens to some extent and makes the article tough and with less liability to fracture.

To largely overcome these difficulties the double bath hardening process was devised, by means of which the article is plunged into brine and instantly transferred into oil without coming in contact with the air. By means of this device, which I now use for hardening all articles, all the advantages are gotten of both the quick and slow cooling processes now in use, and with much less liability of fracture, and in many cases it is not necessary to afterward draw the temper.

There have always been more or less articles made from iron or steel of low carbon and treated to the process known as case hardening. This process, as heretofore practiced, has made the surface, as a rule, hard for only a slight depth; to use the expression as generally applied in this connection, "skin deep." Greater depth than this is at times secured, but with no certainty of results. By means of the furnace to which I now refer, the ancient and well known cementation, case hardening process is brought under complete control.

All have become familiar with the Harvey process, as applied to armor plate. Great depth of high carbon is secured by that process in the surface of low carbon steel, by subjecting the same, while buried in carbonaceous material, to a high heat, beyond the melting point of cast iron. My furnace was designed and constructed with the view of adopting that process in making the bearing surfaces of these ball bearings, but on testing it I found that the high heat necessary by the process raised the grain of the steel so that it was not adapted for these purposes. The high heat also, as it proved, would destroy the efficiency of my furnace, and I decided to use tool steel for the bearing surfaces and the workmen were instructed to use the furnace for annealing and case-hardening purposes. Later developments, using the ordinary process of case hardening with the article packed in carbonaceous material in a cast iron box, demonstrated that the furnace would accomplish, at a low heat, what had before only been possible to do at a high heat.

By means of this furnace, for the past 18 months all the bearing surfaces for these ball bearings have been made from ten carbon Bessemer steel, and also all the reamers, taps, gauges, &c., which have been needed in their construction, as well as a large variety of articles for other purposes.

Having secured, through analysis, the exact result of each day's work, it has been demonstrated that formulæ may be established, and by set rules definite and inflexible results will be obtained. The surface of any article can be carburized to any given required depth, and to any high degree of carbon, at a low heat, and in a limited time, without impairing the cutting or wearing qualites of the steel. The furnace is operated at a very moderate expense for fuel, and has needed no repairs in 18 months of constant use. During that time no article has been cracked or broken through the processes.

By means of the new process for hardening rings and sleeves any number of tubular pieces can be hardened with absolute precision alike one with another. This is especially valuable in the manufacture of the ball bearings, but will in time come into general use for all purposes to which it is adapted.

The tempering oven is quite new, and will give a uniform heat for drawing the temper, which, so far as I am aware, is not at present attainable.

These ball bearings have been subjected to an exhaustive test to determine the saving in power and their wearing qualities. This test demonstrated that the friction is less than one-thirtieth of that developed by the best class of ordinary bearings as now in use. The rotating shaft of the testing machine—a machine designed and made especially for the purpose—was $2\frac{1}{4}$ inches in diameter, and the balls as used in the bearings were $\frac{3}{8}$ inch in diameter. The first series of tests demonstrated that the maximum speed attainable with the best ordinary bearings, under 200 pounds pressure, was 1000 revolutions per minute, owing to excessive heating of the journals and boxes. A ball bearing mounted on the same shaft at 1000 revolutions under a pressure of 2800 pounds did not heat at all.

In the second series of tests ball bearings were introduced in the machine where the ordinary bearing in the first test had been used. The velocity of the shaft was then increased to 2600 revolutions per minute, and it was demonstrated that increase of pressure on the bearings did not perceptibly in

* From a paper read before the Franklin Institute of Philadelphia.

Hosted by Google

crease the resistance (or friction), and with an increase in the velocity the resistance was so slight as to be of no material importance.

A test of the resisting power of steel balls was made. Three ⅝-inch balls stood a direct pressure of 175,000 pounds, or 58,000 pounds per ball, without injury. The same size balls were rotated between parallel plane surfaces, and under these conditions the balls and the bearing surfaces (the latter Bessemer steel, case hardened) successfully withstood a pressure of 2500 pounds per ball.

The New Orleans *Picayune* says the amount of cotton crop of 1893 actually in sight in the South is practically the same as the amount in sight at this time last year. Popular estimates run from 7,250,000 to 7,500,000 bales.

The Morse Valve Reseating Machine.

The Leavitt Machine Company of Orange, Mass., make the valve reseating outfit shown in Fig. 1, which is used to reseat all flat and taper seated valves from 4 to 9 inches, while that shown in Fig. 2 takes the range of 9 to 12 inches. The

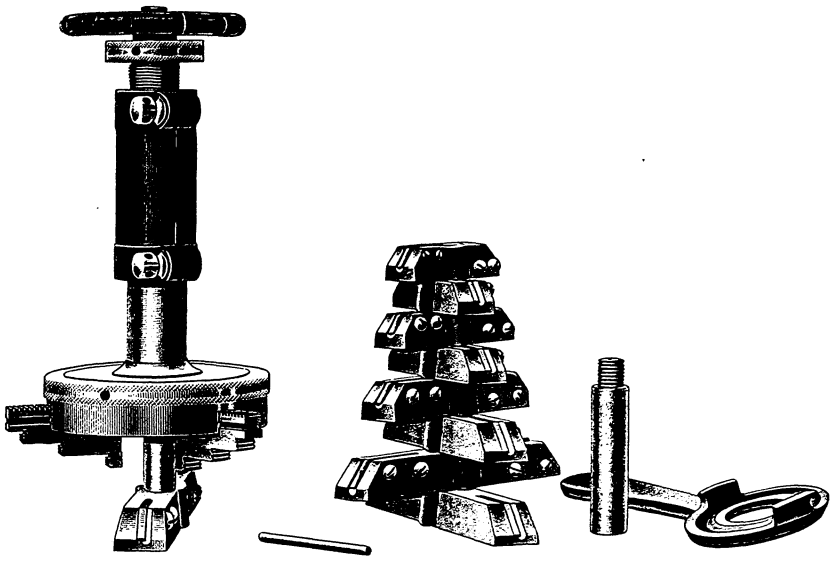

Fig. 1.

Fig. 2.

THE MORSE VALVE RESEATING MACHINE.

lower portion of the machine is provided with a chuck arranged to grip in the opening in the body of the valve and thus hold the device firmly in position. The lower end of the spindle carries the cutter, which is fed to the work by means of a screw having a knurled top, as shown in both engravings. The sleeve carrying the spindle can be clamped in any desired position in the chuck. The machine represented in Fig. 1 is operated by means of a hand wheel, the other being operated by a crank and beveled gears.

Canadian Notes.

Trade and industry have been normally active and nothing has happened to throw either out of its usual grooves. Though the rate of interest has been high—seldom below 7 per cent. since last spring—and though lenders have been very exacting as to the character and amount of security proffered, the circulation has been above the average. In August it was greater than it has been for some years. In September it was almost equal to the very large circulation in that month last year. Mercantile and productive operations have, therefore, not lacked necessary financial sustenance, and both have been larger in volume than they were last summer when less was heard about hard times. Confidence was never absent at any time. Bankers and manufacturers believed that crops would be full, and that everybody's purchasing power would be improved this fall. They therefore co-operated to launch a considerable volume of business upon current credit. The amount and promptness of returns that have matured show that they were right. Harvest machinery, agricultural implements, wire, nails, stoves, furnaces, manufacturing plants, bridge works and sundry other products of iron have figured prominently in the season's exchanges. There have been no failures of any moment in this group of manufactures.

Some hope is entertained that one result of the revision of the United States tariff will be the admission of iron ore free of duty. This hope is cherished both by owners of mining lands of easy access to American consuming importers and by domestic consumers of pig iron. The former of course want a market for their ore, of which there is believed to be an abundance superior in quality and economically available for smelting in the Eastern States and along the border. The iron ore wealth of central Ontario, of Nova Scotia, of Algoma and probably of British Columbia might be considerably developed by a free market in the United States. The establishment of smelting works at various points in this country would be but a partial stimulus to mining enterprise, as, unless we had a large export demand to produce pig iron for, we should be unable to use the product of any great depositories of ore. The consumers of pig iron in this country would be satisfied with the free admission of ore to the United States, as that would be certain to bring down very considerably the price of pig iron, nearly all of their importations of which come from the United States. The abolition of the American duty on iron ore would be felt beneficially in this country in the lower prices at which nearly every article of iron composition could be obtained. Of course our smelters would not hail with approval the free admission of ore to the United States, as such a step would have no influence to cheapen their cost of production, while it would probably raise the price of their material and would certainly lower the price of their product. Since the talk of free iron ore in the United States less has been heard of the numerous proposals to start smelting works at various points.

As the time of year approaches when Parliament assembles there is perceptible a revival of interest in some of the questions left unsettled last session. The Premier and several of his colleagues in government have been touring the country again and holding political

Hosted by Google

meetings, at all of which promises of a revision of the tariff are made. The manufacturers who use pig iron, bar iron, sheet and hoop iron are ready again to push forward their claims for a reduction of the duty. Last winter a very thorough investigation of the question of protection in its effects upon manufacturers whose material was heavily protected was made by a committee of the Toronto Board of Trade. Their case, however, did not come up for consideration before the Budget, with its meager changes, was brought down. They are still urgent for free or but moderately protected material. The farmers of the Northwest are more stubbornly than ever possessed of the idea that their farm implements and machinery should not be subject to so heavy a tax for the benefit of home manufacturers. They still hold out, also, for free binding twine, fence wire and coal oil. The low prices they have had to take for the last two crops of their wheat disposes them to be very steadfast in their support of an attack upon protection. It is improbable, however, that any amendments made in the tariff will materially modify its protective character.

The various associations of iron manufacturers held their quarterly meetings in Montreal last week. The manufacturers of bar iron, cut nails, wire, wire nails, horseshoes, horse nails, bolts, &c., made no changes of moment in prices or terms. But the seam dividing the Eastern from the Central and Western members of the associations has finally opened out and parted the two sections. The manufacturers of St. John, N. B., and Halifax, N. S., have for some time been accused of selling at prices different from those adopted by the association. The former were not at the Montreal meetings, and it has been resolved to consider them no longer in the association, and to meet them at their own prices in their own territory. Heretofore, the arrangements between the two sections has been of the nature of a partition treaty, the East being given up to the maritime province people, and the West to the manufacturers of Montreal, Toronto and Hamilton. The prices quoted in the East precluded Western manufacturers from obtaining their schedule rates there after paying freight. The adjustment of Easterners' prices similarly prevented them from shipping to the West. The Association of Manufacturers of Bar Iron, Nails, &c., is holding well together so far as Montreal and the West are concerned. There were several tentative efforts made, however, before they got a well knit organization. Three years ago a ruinous competition in nails and bar iron brought them together again into an agreement that was both literally and metaphorically a wrought iron agreement.

The Ferrona Iron Works, in Ferrona, N. S, have been in operation about a year. Considerable quantities of their pig iron have been distributed in the West, and the industry appears to be a thriving one.

The machinery for the new iron and steel works at Hamilton has been contracted for. The syndicate has applied for incorporation under the style of the Hamilton Iron & Steel Company. Capital, $1,000,000.

The Central Bridge & Engineering Works, Peterborough, Ont., have a contract for a number of large flexible joints for the water pipes in the Buffalo Water Works. The inside diameter of these joints is 5½ feet, said to be the second largest in the world.

Arendt Angstrom, late naval architect and constructing engineer for the Cleveland Shipbuilding Company, has accepted the position of general manager in the Doty Engine Works, Toronto.

The William Clendinneng Company, Montreal, have been incorporated to take over the business of Wm. Clendinneng & Sons, manufacturers of stoves, ranges, iron pipes, castings, &c.

The array of products of iron and steel manufacture at the Industrial Exhibition at Toronto this year was very large. There was little that was very distinctively new, however.

A cause of some dullness in the seasonable trade in heavy hardware is the comparative backwardness of the lumber industry this year. Last fall and winter operations were very extensive in the lumber regions. The sales to American buyers were larger than they had been for many years. This was due to the lowering of the United States tariff on lumber by the McKinley act. But while our shipments of lumber were large, payments were not so prompt as they used to be. The stringency across the line was severely felt by all connected with our lumber interests on this side. But more than delayed payments and the troubles incident to delay followed. American buyers seem not to have recovered their old financial energy for the autumn business, and lumber prospects here are dull. The hardware trade misses the demand for camp equipments, for saws, axes, cant hooks, crowbars, chains, bolts, &c. Manufacturers of sleighs also report a falling off this fall.

The fine, open fall has made trade brisker than usual in hunters' goods. General lines of firearms of United States manufacture are prominent in stocks.

A factory for the making of a new style of lawn mowers is to be started in Brantford by the former president of the Harris Company, lately amalgamated in the Massie-Harris Company.

The contract for supplying steel rails on Government railways was divided up this year. J. R. Hutchins of Montreal has an order to supply 2500 tons; Charles Cassils of the same city is to furnish a like quantity, both for the Intercolonial Railway. W. H. Daunt is awarded the contract to supply 1000 tons for the P. E. I. Railway and 300 tons for the Windsor branch.

The contract for building the five pairs of lock gates at the Sault Canal has been awarded to an Ontario firm. The engineering estimate of the cost is $80,000.

The facilities for improvement afforded by the evening educational classes of the Young Men's Institute, 222 Bowery, New York, are being increasingly appreciated by young mechanics of the city. The classes this season have a larger enrollment than in any previous year in the history of the institution. Nearly 300 young men, who are working at various trades in the day time, employ their evenings in acquiring mental and technical knowledge, of whom 40 are taking the course in steam engineering, 35 that in electricity and 40 in bookkeeping.

A revival of Mississippi River trade is predicted.

Trade Publications.

PARSONS' MANGANESE BRONZE has been used by the home company of London in over 1200 blades and propellers, and no breakage has occurred in seven years. Its extended use by the prominent steamship lines has proved it to possess all the most essential qualities needed in a propeller blade. One of the peculiarities of this bronze was shown when the "City of Paris" was in dock. One of the blades of her screw fell and the outer portion was doubled up into a U-shape without showing the least sign of a crack. When the steamship "Eider" was on the rocks her engines were driven and yet the damage to the propeller blades was remarkably slight. Tests made by the William Cramp & Sons Ship and Engine Building Company of Philadelphia, who are the sole manufacturers for the United States of this bronze, gave a tensile strength of 66,108 pounds and an elongation of 29 per cent. This test piece was cast on the face of one of the blades for the "Noordland," and may therefore be considered as accurately indicating the quality of the metal in the entire blade. Owing to the fact that no marine growth takes place on these propellers and that there is no corrosion, the speed of the vessel can be kept more closely to its standard. Each of the three blades of one of the screws of the "Campania" weighs about 8 tons and cost as fitted over $17,500. It has been found that the advantages more than offset this high first cost. This bronze is also used for tubing, pump rods and linings, valves and parts requiring strength and non-corrosive qualities. Parsons' white brass has been used in the bearings on the Government vessels built by the Cramps, and also in the merchant vessels built or repaired by them. The agent for these metals is G. Douglas Petrie of 39 Cortlandt street, New York.

WE HAVE RECEIVED from the Lodge & Shipley Machine Tool Company of Cincinnati, Ohio, an illustrated circular of their new turret chucking lathe. This machine was designed to occupy the same position with regard to cast-iron work that the screw machine does in its line. With this lathe blank gears, pulleys, fly wheels, drill press tables, and all parts of Corliss and slide valve engines requiring to be turned, bored and faced (the operations on this machine being simultaneous or separate at choice) may be gotten out rapidly and accurately.

THE HENDEY MACHINE COMPANY of Torrington, Conn., issue a catalogue describing the Norton improved screw cutting engine lathe made by them. In this lathe the ordinary train of change gears is mounted in the form of a cone directly on the screw of the lathe, to which they are secured by one spline. Motion is transmitted to either of these gears from a stud gear splined to a shaft parallel with the shaft of the cone and engaging with an intermediate gear which is mounted in a fork in such a way that it can be brought to engage either gear of the cone. In this way the cone can be arranged to cut the regular list of threads from 6 to 20. In a circular they also describe their 15, 24 and 25 inch pillar shapers.

THE BICYCLE POWER PLATING DYNAMO is described in a catalogue by the Hanson & Van Winkle Company of Newark, N. J. This consists of a cast iron column, near to top of which is placed an adjustable bicycle saddle and near the base of which is a shaft carrying two bicycle cranks of the usual form on a band wheel. The dynamo is mounted on top of the column. Electroplating of any kind within the capacity of the machine can be easily done.

A GENERAL CATALOGUE of pumping engines, steam pumps and hydraulic machinery built by Henry R. Worthington of 86 Liberty street, New York, has been received. This describes all the more important types of pumps made by this extensive establishment.

The loss to shipping off the Atlantic Coast caused by the great storms of the last two months is estimated to be nearly $3,000,000.

THE WEEK.

Tho New York and New Jersey Bridge bill was passed by the House last week, after amendment so as to require the expenditure of $1,000,000 per year after the first year, and that the work shall be completed within ten years. J. H. Swan of the Bridge Company, whose plan has been approved, is quoted as stating that almost all the railroads running into Jersey City have signed an agreement with his company to use one bridge and station, which will be built at Forty-second street, New York, between Broadway and Seventh avenue. The only great road that has not yet joined the agreement is the Pennsylvania, and its adhesion is promised when a guarantee of the actual building of the bridge and station is given.

Twenty vessels and 54 lives was the total loss on the great lakes during the furious storm which swept over them last week. The value of property lost is estimated at over $700,000.

The Pullman Palace Car Company have apparently suffered less from the prevailing business depression than the majority of manufacturing industries. The report of the company's business presented at the annual meeting of the corporation in Chicago last week showed that more men were employed and higher wages paid during the past fiscal year than ever before in the company's history. The financial statement showed total earnings for the year to have been $11,389,896, and operating expenses $3,825,940. The total number of persons in the employ of the company in their manufacturing and operating departments is 14,635 and wages paid during the year $7,751,644. The number of employees for the previous year was 12,809 and wages paid were $6,619,156.

A Yonkers, N. Y., carpet manufacturing concern is reported to be shipping some large consignments of carpets to England in response to orders from the other side

The British Admiralty have just placed an order for 1000 tons of Harveyized armor for the new battle ship "Renown."

The rapidity with which grain is now being handled in Buffalo is something quite unprecedented. During one day of 24 hours last week the receipts at that port aggregated 1,600,000 bushels.

The "Cevic," a cargo steamer recently launched from the yard of Harland & Wolff, Belfast, Ireland, and destined for the transatlantic trade, is by far the largest cargo vessel in the world. This steamer is 500 feet in length, 60 feet in breadth and 38 feet in depth. Her estimated gross tonnage is 8315 and her total capacity of holds 14,089 tons. The vessel is fitted with two sets of triple expansion engines.

A heavy frost which visited the South at the beginning of last week caused severe injury to crops and vegetation in Tennessee, Louisiana and Mississippi. Cotton will, it is calculated, suffer to the extent of 15 to 20 per cent. of the crop.

Ex Senator H. G. Davis of Baltimore, Md., is said to have started a promising new industry, namely, the shipping of West Virginia coke to the silver mining districts of Mexico.

A new coaling device for ships at sea was tested off Sandy Hook last week, when the U. S. flagship "San Francisco" was coaled by the "Kearsage" while the ships were 200 feet apart, and steaming at the rate of 4 knots an hour. The system, which is on the trolley principle, is the invention of Philip H. Low, an ex-United States navy officer, and its advantages in obviating the necessity of using shore coaling stations in certain cases—such as war times, &c.—are obvious.

An electric hearse is the latest innovation in trolley transportation in San Francisco. The vehicle is in use on a railway leading from the city to four suburban cemeteries.

The cattle slaughtering record of the world was beaten last week at Armour's Kansas City packing house, where 3218 cattle were killed in 11 hours, the average being five a minute.

No more striking evidence could be given of the prevailing dullness in business than the announcement that the Reading road is to withdraw no less than 28 passenger trains from its system, including eight from the New York division and 12 from the main line.

It is probable that New Haven, Conn., will spend $100,000 in repairing several of its bridges.

Work is progressing rapidly on the new buildings of the United States Armory, at Springfield, and already finished work has been done on the new Krag-Jorgensen arms.

The *Railway Age* mentions that recently two steamers carried away, within 24 hours, as much freight from Chicago as all the railway lines leading to the East in that time, notwithstanding that the latter have cut down their rates to the closest of margins.

New Publications.

SEVENTH BIENNIAL REPORT OF THE BUREAU OF LABOR STATISTICS OF ILLINOIS, FOR 1892. By John S. Lord, Secretary of the Commission.

As a statistician on the coal trade of Illinois Mr. Lord has been long and favorably known. He is now working in a wider field, and has embodied in the report just issued the results of a very elaborate investigation concerning the working women in the city of Chicago. The inquiries of the bureau have been directed to the earnings and environment of the working women and girls in that city. The investigation covered not alone the transcription of wages and work record of each person from the pay rolls of the establishment with which they were connected, but extended also to the personal earnings of the employees. Facts have been gathered not alone relating to their incomes, but also to their expenses, their place of abode, manner of living, and various details of personal description. In this way statistical details have been gathered on the work, wages and welfare of 5099 women, employed in 95 establishments and 43 industries, and pursuing 474 different occupations in the city of Chicago. Mr. Lord summarizes his data relating to wages as follows: "We find that 21 out of 4526 employees were working for less than $2 a week; also that 17 were receiving $20 or more per week. Between these extremes the greater numbers are massed in three classes earning from $4 to $7 a week, as follows: 675 received from $4 to $5; 882, from $5 to $6; 860, from $6 to $7; total, 2417. Below this central group are found 680 who earn less than $4 a week, and above it are found 1429 who earn from $7 to over $25 a week. This, then, is the general statement concerning 4526 women and girls employed in 90 establishments, in 41 industries, the same being all the employees of every rank and grade in each establishment—viz.: That 15.02 per cent. of the whole number earn less than $4 a week; 53.40 per cent. earn from $4 to $7 a week, and 31.58 per cent. earn from $7 upward."

Data are also presented on the amount of time lost, the expenses, including board and lodging, clothing, sickness, car fare, &c. It appears that board and room to those who pay specific amounts for them absorb 56.4 per cent. of the average earnings; that the item of clothing requires an average expenditure of 21.5 per cent. of the income, making a total for subsistence and clothing of 78 per cent. of the income. Mr. Lord has also gathered statistics of age, nativity, conjugal condition and residence, health and home surroundings, the whole showing an industry and a care which make the report particularly valuable.

An incidental though natural outcome of the inquiry was the collection of data relating to the sweating system in the clothing trade. The canvass of the bureau has disclosed the fact that there are 666 shops with which there are connected, working either in the shop or at home, 10,933 employees, which is very much less than the usual estimate, which ranged between 30,000 and 40,000 employees.

The third part of the volume deals with the statistics of coal mining in Illinois, compiled from the reports of the State inspectors. In this it is shown that during the year ending July 1, 1892, the total number of net tons of coal of all grades mined was 17,862,276. The statistics embrace details relating to labor, both in hand mining and in machine mining. Figures are given concerning the tonnage of coal mined by machine, the number of machines used in the different mines and the number of men employed in connection with them. Mr. Lord has also investigated the question of the consumption of powder in the mines, which shows that the tonnage of coal per keg used was 39.5 tons, while in machine mining it was 95.3 tons per keg. The usual accident statistics are appended. The general report is followed by the detail reports of the different mine inspectors' districts.

BOLIVIA. Bureau of American Republics; Bulletin No. 55, Washington, 1892.

The Bureau of American Republics has added another to the series of manuals on Central and South American countries. The last issued is that on Bolivia, the general plan being followed which has been adopted in all the publications of this series. The first part of the work deals with the geography, climate and resources of that country, while the second section reproduces the political constitution of the Republic and gives in full the import duties of Bolivia.

AERONAUTICS is a new monthly publication which is the outgrowth of the recent International Conference on Aerial Navigation. It is published by the *American Engineer and Railroad Journal*, 47 Cedar street, New York, whose editor is the well known engineer, M. N. Forney. Those who believe in the future possibilities of flight will find it a useful aid in their study.

RICHARD R. WILLIAMS, - HARDWARE EDITOR.
JOHN S. KING, - - - BUSINESS MANAGER.

The Effect of Cheap Steel Beams.

The low price of steel beams is now opening up a wider field for them. They are no longer a luxury, available only by those erecting large buildings and to whom cost is a secondary consideration. Builders of moderate sized structures are using them freely in the place of large wooden girders. Warehouses and stores, with no architectural pretensions whatever, are now absorbing considerable quantities of beams, whereas but a short time since they would not have been seriously considered by the builders. Some progressive architects are even specifying them for use in certain places in dwelling houses. Notwithstanding the general depression in the building trade at present the tendency to substitute steel beams for wood is a notable feature of the beam business, and manufacturers are hopeful that the movement will continue to grow. In this prospect of enlarged consumption in the future they see some compensation for the very low prices now ruling. Cheapness is a very effective missionary.

With the movement begun for the use of steel beams in ordinary structures, a great deal has been accomplished which will be of much value if it is persistently followed up. There are many architects and builders who know but little practically of the use of steel beams. They need to be informed of the manner in which such material can be used in partial steel construction. This is a line in which it might be well for the manufacturers of beams to do some educational work. In the construction of buildings, particularly in large cities, economy of space is often very desirable, and a steel beam will often be found decidedly preferable for that reason to a bulky wooden girder. Again, the matter of shrinkage is something that proves very annoying to builders, who find their best work frequently marred by the unexpected shrinkage of a large girder, guaranteed perfectly seasoned, but susceptible to atmospheric changes, as all wood is. There is hardly a house of moderate size in which some steel beams could not be used to advantage. In building expensive dwelling houses, however, architects and builders by the use of steel beams could make them either fire proof or of a "slow combustion" type. It would be of much interest in this connection if some competent person were to make a comparison of cost between such a house and one fitted with wooden joists. It is believed that the enhanced cost would be found so moderate that the man who could afford to build such a house would prefer to pay the increase and not only enjoy the sense of security from danger of fire but find an absolute saving in the lessened cost of insurance.

Beam manufacturers could very profitably to themselves follow up this educational work and instruct builders in the special advantages to be realized from the enlarged use of steel structural material. In entering this field it might be found necessary to make modifications in the shapes and sizes of beams now standard in order to meet new requirements. In the construction of dwelling houses there would, for instance, be no necessity for using the heavy beams now made. Perhaps 3 or 4 inch beams, properly stiffened by cross beams, would be found suited to a great deal of such work. Beams of this size, weighing much less than standard beams, would not be a very costly investment for owners desiring fire proof or "slow combustion" houses, although manufacturers would probably charge more for them than for the heavy sections, being more expensive to roll. There is certainly a most inviting field opening up in this direction for the beam trade and as the era of low prices for beams has apparently come to stay it is likely to prove in the future a better business in point of value than has thus far been enjoyed from the construction of large buildings.

The World's Fair Closes October 30.

The managers of the World's Columbian Exposition have acted wisely in deciding to close on the 30th inst. This is the day which has been set for the termination of the fair from the time when the preliminary arrangements for the enterprise crystallized into definite announcements. It is not surprising that the enormous increase in attendance which has characterized October should have inspired many individuals interested in the affairs of the exposition to plan for its prolongation beyond the official date of closing. They are so numerous and influential that at one time an apparently authorized statement was published that the fair would be continued as far into the winter as the weather would permit, and that next year another six months' fair would be held on the exposition grounds, even if it were confined entirely to domestic exhibits. The legal advisers of the management, however, promptly showed that there were many obstacles in the way in the nature of legislative enactments and innumerable contracts, all based on an early termination of the existence of the enterprise. Complications of an apparently insurmountable character were thus set forth, and enthusiastic advocates of prolongation became convinced that their plans were not feasible. This is well, as it would be a reflection on the splendid management of the fair hitherto if it were to be permitted to run until it simply "petered out" as it would assuredly do. A general feeling of regret is experienced that the magnificent architectural effects of the exposition buildings cannot be preserved. If it were possible to permit the buildings to stand as they are, there is no doubt that they would prove a great attraction to strangers visiting Chicago who have not had an opportunity to attend the fair. But there are many reasons why even this cannot be done. The buildings will be demolished and every vestige of them removed at as early a day as possible, and their beauty will then only be a memory.

Defense of the Atlantic Coast

Gen. O. O. Howard, commanding the military department of the East, in his annual report, just published, strongly urges the establishment of a more efficient system of coast defenses for the great ports on the Atlantic Coast. While admitting the defensive value of the navy and of the naval reserves, he reminds the Government that the work of this arm in time of war would be rather in the offensive department, so that for the defensive purposes of permanent works the sea coast batteries, including mortar shells and other projectiles and all the modern torpedo preparations, must be kept in mind. General Howard is of the opinion that the first attention is needed for the most important ports—*e. g.*, New York, Boston and New Orleans. But the defense will, he thinks, fall far short of what it should be until such cities as Philadelphia, Baltimore, Washington and those near Hampton Roads, as well as Charleston, Savannah and Mobile, are properly covered by defensive works, well marined and properly equipped with modern ordnance. General Howard's convictions on this head are evidently shared by other experienced military authorities, for the Inspector-General of the Army—Brig.-Gen. J. C. Breckinridge—in a recent report pronounced the condition of affairs in the matter of coast defense as "disgraceful," particularly on the Southern coast, which, he says, is "wholly unprotected and at the mercy of any enemy, the forts crumbling away, the cannon rusting and the gun carriages rotting." Twenty-seven forts have, during recent years, been entirely abandoned, and are gradually becoming dilapidated ruins. Ceneral Breckinridge strongly recommends their being put in order and regarrisoned, and he would have all the guns remounted, cleaned and generally repaired, if nothing better can be done at present. Congress, however, is proverbially slow to move, and the important matter of coast defenses appears to have taken a back seat of late years in Washington. Happily there is no

Hosted by Google

immediate likelihood of a foreign war; but should such a remote contingency arise, the condition of our Atlantic and Gulf Coast defense—or want of defense—as described by such competent authorities as the general officers above quoted, must cause grave misgivings.

As Foreigners See Us.

Thousands of foreigners have visited the United States for the first time this year. The majority of them are men who are fairly prosperous at home. A few of them are professional exhibition visitors, and a small number are people of leisure traveling to escape boredom. With these few exceptions they are professional and business men who have come to study for themselves the resources and the methods of work of this country. The last few decades have opened the eyes of Europe to our development, and the appearance of American products in many branches of commerce and industry has foreshadowed threats of rivalry from the rapidly growing Western giant. Reports of the impressions thus gathered are becoming numerous in the European press and are not altogether flattering. Many of them are crude, and others are tainted by a spirit of fault finding. Some of our foreign visitors have failed to grasp the fact that conditions are not the same on both sides of the Atlantic, and that what may be good practice there would be an unprofitable method here. Still, honest criticism and kindly comment should be carefully considered by the victim.

One of the things which seem to have struck our visitors is the worship of bigness in America. The one thing which we are accused of never failing to urge with pride is the magnitude of what we show. They are struck by our love of inspiring awe rather than admiration. Our eagerness to dwell on numerical maxima astonishes and amuses them. To them there is little merit in the "biggest thing in the universe." Mere magnitude in their estimation fades into insignificance as compared with the merit of finished excellence and beauty. Unprejudiced Americans will admit that there is a good deal of truth in that criticism, but they will at the same time acknowledge to themselves that in that respect we are not now really quite as bad as we were.

Another matter which foreign visitors are apt to refer to is coupled with the utilization of our enormous resources. We have often observed that a feeling akin to envy pervades their study of our natural advantages. But the one point raised, particularly by the thrifty men from the Continent, is the reckless and often criminal wastefulness which characterizes so many of our operations. Our skinning of the soil, our savage inroads into our forests, the careless destruction for further use of much of our mineral treasures, our neglect in utilizing waste products and old materials, are astounding to them, and at times give rise to indignation and disgust. They point out that we are quick to adopt some makeshift and go on renewing it at frequent intervals rather than spend the money for one lasting structure. The same lavish extravagance pervades the whole community from the laborer to the captain of industry. It obtrudes itself upon the foreigner in private, municipal, national and industrial affairs, and is to him our greatest reproach and our most serious source of danger.

Let it be conceded that it may pay to waste, that posterity has no rights which the living are bound to respect, and yet, with all that eliminated, the criticism that Americans are wickedly wasteful remains only too true. It cannot be contemptuously waved aside as a proof of a mean spirit. We believe that, on the whole, it is one of the principal sources of comfort which has come to those Europeans who have studied our capacity as rivals in the early future. They frankly say that as long as we go on in the extravagant manner apparently habitual with Americans, high and low, they need not fear us as competitors. It is possible that the very sharp lesson which is now being taught us will rid us earlier of a national sin than our foreign friends anticipate.

PERSONAL.

Theodore Fry, M.P., an English ironmaster, who was a member of the party of the Iron and Steel Institute in 1890, has the distinction of having made the fastest trip of record between Queenstown and Chicago.

Professor W. Hartmann of Berlin who was the representative in Chicago of the German Society of Engineers, sailed for home last week.

H. W. Borntreager of the Carnegie interests at Pittsburgh sailed for Germany this week for the purpose of bringing his family, who have been abroad for some time, to this country.

A correspondent in commenting on the article which appeared in *The Iron Age* of last week regarding a shipment of American pig iron to England confirms the view taken of the circumstance and says that a similar hubbub was raised in 1884 when a shipment of Michigan charcoal iron was made to Liverpool to be used for special malleable castings, for which it was difficult to find a metal that was suitable. At that time our correspondent was in Scotland and during his visit attended a meeting of a literary society at which the subject was referred to by a member, who took exception to what was said by the lecturer of the evening. The lecturer had taken for his subject "Nothing New" and had endeavored to explain that the many wonderful happenings of the century had a parallel or origin in the history of civilization. The critic of the evening asked if it was not something new for pig iron to be shipped into England, as had recently been done by Americans. The lecturer admitted that it was a new departure so far as America was concerned, but the circumstance was not a precedent, as primitive pig iron was shipped to England from the shores of the Mediterranean many centuries before America was discovered.

CORRESPONDENCE.

Copper Coating the Hulls of Vessels by Electricity.

To the Editor: The interesting article on electro copper plating steel vessels in a recent issue of *The Iron Age* shows that it is admitted by those most competent to judge that as a protection to the hulls of steel vessels a sheathing of copper is superior to anything else, and the electrical method of the Ship Copper Plating Company you describe is, to my mind, the cheapest and most practical way of applying such a sheathing. The figures you give as to the rate and cost of depositing a copper sheathing by their method, while correct in the main, are not as clear as they might be, and if not carefully read give the impression that the plating of a ship 400 feet long would require a plant of 780 horse-power. The following figures will, perhaps, give a more clear idea of the time and horse-power required.

Taking the thickness of the copper coat to be deposited as $\frac{1}{20}$ inch and the correct density to be used as 12 ampères per square foot, the time required to deposit such a coat will be about 72 hours. For a square foot of copper $\frac{1}{20}$ inch thick will weigh a little over 36 ounces. And as one ampère will deposit nearly 1 ounce of copper in 24 hours 12 ampères will deposit 36 ounces in a little over 72 hours.

The electromotive force required will be 2½ volts, and if 120 10 x 4 feet tanks are in use the electric horse-power required will be a little over 193, as is shown by the following figures: The combined surface of the 120 tanks will be 4800 square feet, which multiplied by 12 ampères will give 57,600 ampères; this multiplied by the voltage gives 144,000 watts, or a little over 193 horse-power. Taking the efficiency of the electrical plant at only 80 per cent. it would at no time take more than 241 horse-power to run 120 tanks.

J. D DARLING.

FRANKFORD, PHILADELPHIA, October 17, 1893.

OBITUARY.

JOHN O HUGHES.

John O. Hughes, senior member of the firm of Hughes & Patterson, iron manufacturers at Kensington, Philadelphia, died suddenly in Chicago on the 18th inst. of heart disease. Mr. Hughes, together with his wife and Mr. and Mrs. John Fritz of Bethlehem, were visiting the exposition when death came to Mr. Hughes without a moment's warning. Deceased was born in Denbigh, Wales, in 1832, and when a young man emigrated to this country. He became identified with the iron trade, and entered the firm of Hughes, Morgan & Caskey, by whom, in 1870, the Delaware rolling mill at Kensington was erected. The firm afterward becames Hughes & Patterson, and in 1877 Walter Hatfield was admitted to an interest. The Philadelphia rolling mill, at Beach and Vienna streets, Philadelphia, was purchased by the firm in 1889 and added to the plant, the total annual capacity being 27,000 net tons of bar iron, iron specialties, skelp, bands, hoops and rods. Robert Patterson died last April, and on May 1 Robert J. Hughes, the eldest son of the senior member, was given an interest in the business. Mr. Hughes possessed a thorough knowledge of the iron busi-

Hosted by Google

ness, and it was mainly by his efforts that the establishment was brought to its present size. He was a well-known club man, but never associated himself with politics.

S. P. HINKLEY.

S. P. Hinkley, manufacturers' agent, whose office was located at 101 Lake street, Chicago, died in St. Louis on October 18, while in that city on business. He was born in Somersetshire, England, in 1838, and came to America when he was 20 years of age. He had been a sufferer from heart trouble for several years. Mr. Hinkley represented the Samson Cutlery Company, the Crescent Saw Company, and Joseph McCoy & Co., at the time of his death. He was about 55 years old, had been a hardware salesman of many years' experience, enjoyed a wide acquaintance, and was highly esteemed for his many excellent qualities of head and heart. He leaves a widow and two sons.

Sheet Mill Wages.

When the iron and steel roofing business commenced its rapid development into a very important industry some 12 years ago competition became brisk, and in order to compete successfully many roofers decreased the weight per square foot of flat sheets used without changing the gauge marked thereon, so as to keep their cost down and even up on the reduced prices at which their finished goods were sold. According to the old standard No. 27 used to weigh 72 pounds per square, flat, but it was reduced to 68 pounds, 66 pounds, and finally to 64 pounds. When the lowest figures were reached the Iron and Steel Roofers' Association condoned the sin of their brethren by adopting a new standard, taking Haswell for authority. According to the new table of weights No. 27 was made to weigh $\frac{64}{100}$ pound per square foot, but according to the rolling mill table of weights as printed in the agreement entered into with the Amalgamated Association of Iron and Steel Workers sheets rolled to this weight should be classed as No. 28 gauge, and upon that basis the mills of the Wheeling district have always paid their rollers. When the Roofers' Association established their weights attempts were made to get $\frac{64}{100}$-pound sheets rolled at No. 27 price, but the workmen objected and have always received the full No. 28 gauge price, which was $10.40 per ton. Pittsburgh mills also made settlements on the same basis, but many mills outside these two districts succeeded in getting $\frac{64}{100}$-pound rolled for No. 27 price, $9.60 per ton, thus gaining an advantage of 80 cents per ton over some competitors, while the scale of wages signed was in each case identical. Since July 1 the legal standard of weights for various gauges of iron and steel sheets has become the basis of settlements and No. 27 now weighs $\frac{68}{100}$ pound, the price for rolling the same being $10 per ton. This change places the mills that formerly paid $9.60 for No. 27 gauge in a worse position than they were prior to July 1, as they now pay $10 for rolling $\frac{68}{100}$-pound whereas they used to get $\frac{64}{100}$-pound rolled for $9.60, a difference of 40 cents per ton. This is the principal concession known to have been made by workmen. In explaining the matter workmen will say that they were ignorant of the exact weight of the sheets they were rolling, but such a statement does not destroy the fact. In like manner many other concessions were made (with a wink) when mills were able to secure large orders for sheets rolled to special weights which came between two gauges of the recognized table. Although contrary to the rules of the A. A. of I. and S. W., one instance is known where No. 27½ gauge was paid, half the difference between No. 27 and No. 28 being added to the price of No. 27. This occurred at an isolated mill. It is right that concessions of this kind should be made between employers and employees, provided neither side belongs to an organization, but when organization does exist and both manufacturers and workmen are supposed to be placed upon an equal basis in their respective competition, the basis should be maintained or organizations should be disbanded and local agreements govern the matter of prices to be paid for labor.

Trade-Marks.

We are indebted to Francis Forbes, secretary of the United States Trade-Mark Association of New York, for copies of a series of valuable papers read at the Congress of Patents and Trade-Marks at Chicago. The subjects discussed are of such importance to manufacturers that we present the leading features of some of the papers.

The Present Condition of the Trade-Mark Law in the United States.

BY J. M. BATTLE OF ST. LOUIS.

The practice of designating certain manufactured products by trade marks and labels is one that has met with the approval of the public, having many advantages in its favor, while few, if any, objections are to be made against it.

It would seem that the statutes of the United States which created the trade mark would throw around it every safeguard, and make it as sacred as other rights so highly prized by the American people. The history of trade-mark legislation shows that Congress has had this object in view, but unfortunately has been thus far unsuccessful in the work of perfecting a law which the courts will uphold, and to-day the statutes of the United States provide no penalty for imitating or counterfeiting trade-marks or labels.

The holders of trade marks may proceed against infringers by civil action under both Federal and State laws, and many States inflict penalties for violation of trade-mark rights; but for many reasons, unnecessary to enumerate here, a Federal penal law is necessary. Many ordinarily well informed persons presume that we now have such a law, and indeed it is to be found in the Revised Edition of the U. S. Statutes, but it has been decided by Judge Brewer (40 Federal Rep., page 250) to be "a dead letter," and it is only necessary for us to know that it is such, without tracing out the technicalities involved.

In consequence of legal entanglements, the dishonest dealer resorting to imitation, counterfeiting and substitution has become bolder and bolder in his nefarious work. Almost every meritorious trade-mark article known to commerce has been made the basis for such depredation. One can scarcely find an advertisement for such goods which does not contain the warning "Beware of imitations." It has been said in an editorial in one of our leading papers that it has come to pass that the more the manufacturer advertises his trade-mark goods the more the imitator fattens and flourishes. As far as the manufacturer is concerned this contemptible practice is simply a robbery of his name and profits, a practice that ought not to be tolerated or indulged in by any man who respects himself or the rights of others.

The people are made defenseless victims. They have learned to depend upon certain trade-mark articles, the value of the genuine of which they know by experience, and the fraud practiced upon them by imitation not only deprives them of the right to the identical thing they are giving up their money for, but often endangers the life or health of the person imposed upon. Take for example many proprietary foods and medicinal preparations used in the treatment of disease and in surgical operations. The physician is familiar with and satisfied with the nature and quality of certain proprietary articles and frequently resorts to their use. It requires no great stretch of the imagination to contemplate the magnitude of the offense of supplying him and his patient with an inferior or worthless substitute—it is simply heinous. Infirmity or death is the result to the patient. The reputation of the physician is damaged. The guilty druggist, however, has made a few cents more than he would have done had he sold the genuine article, and he continues to pirate and thrive without molestation.

Congress has shown a disposition to curb this evil. At the last session a bill was introduced by Mr. Hall of Minnesota providing for the proper registration of trade-marks and labels, settling disputes concerning their rightful ownership and providing punishment for parties found guilty of imitating them or the goods to which they apply. This bill was considered by the Committee on Patents and favorably reported to the House of Representatives, where it failed to reach a hearing for want of time. It will be presented to Congress again at this session either by Mr. Hall or some member of the Committee on Patents, and every honest man in this land who can exert any influence upon a member of Congress should do all in his power toward obtaining for it a full hearing. There is no doubt about it passing, if fully considered.

The question may arise, why is it necessary to influence the members of Congress to take action upon a measure of such manifest importance and justice? At the last session of Congress there were pending over 10,000 different measures, and at this session there will be as many, if not more. It is not reasonable to presume that any human being can within the limited time carefully read this great number of bills, separate the good from the bad and concentrate his thoughts upon the few that should become laws. Use every opportunity in person and by letter to press it upon the minds of the Congressmen and keep it uppermost in their thoughts. If concerted action is taken by parties interested this bill will become a law. Then the manufacturer will no longer be robbed with impunity. Then the buyer will obtain the identical article he pays his money for.

Trade-Marks From the Manufacturer's Point of View.

BY EBERHARD FABER.

The manufacturer who expects to sell articles made by him because he believes them meritorious will adopt and affix some mark to them as a sign indi-

Hosted by Google

cating to the purchaser the way of return to the article. He thereby establishes a good will of his business.

While the quality and character of the article are preserved the tendency to a return to purchase is sure; but if the quality or character is changed by a manufacturer, or if the purchaser is so often deceived by spurious articles that he cannot be sure of the original sign, then the manufacturer's trade is lost and can only be regained, if at all, at great cost.

In the notable litigation in the year 1877, between Colman & Co. and Crump, over the bull's head label for mustard (reported in the New York Court of Appeals Reps., Vol. 70, p. 573), it was alleged on the part of the plaintiff that their sales had dwindled from a very large to a very small amount and that while so dwindled some 6,000,000 spurious bull's head labels had been sold for application to packages of so-called mustard.

Again, a manufacturer of salaratus, long since out of business, stated that he went abroad, leaving his business in the hands of an agent who had full control. At the time of leaving the sales were very large, and the packages honest and full weight. On his return two years afterward he found that the pound packages had shrunk to ⅞ pound and all others in proportion, and that the trade had shrunk to one quarter of its former value. He attributed the loss of sales to the deception of the purchaser. He closed the business. Many instances of this kind are familiar to every manufacturer. The fierce competition of late years and the striving of many establishments to produce and sell goods at lower prices than others have led the more unscrupulous manufacturers to imitate goods of long standing reputation and bearing widely known marks.

All that the manufacturer of a uniform product meeting the wants of the people desires is to be let alone by imitators, retaining his sign or mark so distinct that the most unwary may be able to return and repurchase his product.

It is apparent that good morals teach that his wish should be observed. Anything which contravenes it is based on deception. Such deception can be restrained by the courts, but the proceedings have been and are expensive and uncertain, and many of the States have passed penal statutes for the repression of imitation, viz.: Arizona Territory, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nevada, New Jersey, New York, North Dakota, Ohio, Oklahoma Territory, Pennsylvania, Texas, Utah, Washington, Wisconsin.

But still the manufacturer is not secure in the condition in which he believes himself to be placed and to which he is justly entitled by the rule of morals. He has neither a mark which will go everywhere and be protected everywhere nor proper means of ascertaining whether he may not himself be a violator of the moral if not the statute law. The latter is the more serious of the two questions in the United States, where there is absolutely no means of determining who is the first to adopt and use a mark, and therefore entitled to it. An approximation may be reached by a long series of advertising, *e.g.*, such as has been given to such well known articles as Spencerian pens, Sozodont, Rising Sun stove polish, Maizena, Sapolio, Armour's extract of beef, Pearline, &c., but these have become known through the length and breadth of the land by a vast amount of advertising, and it is not to be expected that any one who had a prior claim would remain silent.

The actual condition of things which not only may but does exist is illustrated by the stove, which is a bulky article with a more or less local sale. A directory of stove marks issued a few years ago showed that all but one brand given were used by from two to five different manufacturers. When the British law of registration was adopted it was found necessary to allow any mark which was not then in use by more than three persons in different parts of the United Kingdom to be registered by each of the users up to three. If there were more than three users then the mark was considered a common mark and none were allowed to register. The British law has remedied this difficulty by requiring new marks to be published and registered, and there can now be no excuse for adopting marks similar to those already used by others. In this country, however, no national registration of all marks exists, and an attempt has been made by private means to ameliorate the condition of the manufacturer in this respect. I say ameliorate because no private enterprise can make the position more than tolerably safe. The means to which I refer is the United States Trade-Mark Association.

If the manufacturer is himself within the bounds of good morals and has adopted a trade-mark—perhaps struck out of a pleasant sound in a moment of inspiration and put into letters—he ought to be let alone in its possession, not only in his own country, but the world over. This would seem right to both the manufacturer and the consumer. In this age of the world, when the printing press is spreading the fame of an article everywhere, it is a matter of importance to the far away purchaser, who has only heard of the fame of the article or who has obtained a stray sample, that he be protected from imposition.

It is understood that a bureau for the international registration of trade-marks has been established at Berne, in connection with the Union for the Protection of Industrial Property between Belgium, Brazil, France, Guatemala, Great Britain, Italy, Netherlands, Portugal, Servia, Spain, Switzerland, Sweden and Norway, United States and Tunis. But registration can only be made at this bureau through the intervention of the nation. The United States has not yet made provision for such registration for its citizens.

I have called your attention to the prime needs of the manufacturer and to the means at his disposal to fulfill them. These means, it is evident, are not sufficient in this country, and it is proposed that united action should be taken by the manufacturers of the United States to establish a proper national trade-mark law superseding the present State laws on the subject.

Not until then can any manufacturer be safe in the good will which he has created for his products, or in the esteem of his fellow citizens which comes from respecting the rights of others. The Supreme Court of the United States has held (McLean *vs.* Fleming, 96 U. S., 245) that an injunction might be granted after a lapse of ten years of continuous use against the second user of a mark—*i. e.*, the one who was unfortunate enough to be second in point of time to adopt the mark—and this might happen although the second user had not intended to infringe anybody's rights. It is outrageous that such a pit should exist, into which the cautious may fall. In a country where registry laws in their proper form prevail such a case could not happen, because suit could not be brought except upon a registered mark. The registration allowed in this country not being required as a prerequisite to a suit, is not of such a complete character for marks in existence as to be of any aid in assuring the adopter of a new mark that he is not taking something which belongs to another.

It seems to be necessary for the public good that provision should be made by the nation for the proper adoption and continued use of marks indicating the particular manufacturer, and that further provision should be made for the full use by our citizens of international registration.

Trade-Marks.

BY ELIJAH A. MORSE, CANTON.

The value of State and national legislation for the projection of property rights in trade marks cannot be overestimated. Property in trade-marks has been recognized in civilized nations for centuries, and in more modern times by legal enactments to protect, secure and defend the owners of trade-marks. Although, unfortunately, a United States national law on this subject, making piracy a penal offense, was some years since declared unconstitutional by the Supreme Court of the United States, I regard the matter of so grave a moment that I think it of sufficient importance in this country to secure if possible a constitutional amendment, giving Congress authority to re-establish the old law upon this subject, owners at present being compelled to defend their rights under the common law and State law. A uniform trade mark law for the whole country—like a uniform bankrupt law—would be of great value.

Why should trade-marks be protected? 1, untold millions of money are invested in the manufacture of articles, and untold thousands of men are employed in industries protected by trade-marks, and upon the protection of which the continuance of these industries depend. 2, no one is more interested in defending the rights of owners of trade-marks than the consumer, who thus learns to distinguish the kind and quality of goods which he wishes to buy, and which he is well nigh certain to obtain under protected devices and trade-marks. Impair, or destroy or refuse to protect such marks and the property rights in them and such benefit to the consumer (in many cases priceless) is lost. 3, the protection of trade-marks prevents ruinous competition, which compels an inferior quality, short count and short weight to meet the demands of competition when the article is not so protected.

I look upon associations for the protection of trade-marks and legislation to that end as wise and far reaching statesmanship, beneficial, 1, to the manufacturer; 2, to his employees, by insuring them permanent employment; 3, to the merchant, wholesale and retail, by largely lightening the labor of personal examination of goods purchased and sold, the trade-marks in most cases being a sufficient guarantee of quality, weight and count; 4, by the great benefit to the consumer, by insuring him in his purchase of certain marks a uniform and known

Hosted by Google

quantity, quality, weight and count of merchandise, in the case of drugs, medicines, prepared foods for the sick and surgical instruments, for instance, often a case of life and death.

I should hope that this Congress would memoralize the civilized governments of the world for continued and additional legislation for the defense and protection of property rights in trade-marks.

MANUFACTURING.

Iron and Steel.

The Indiana Iron Company, Muncie, Ind., manufacturers of bar iron and steel, recently made a proposition to their employees to pay them $4 per ton for puddling and 25 per cent. less on last year's scale for finishing. This proposition was not accepted by the men, and the probabilities are that when this plant resumes operations it will be started up as a non-union mill and on a scale of wages mentioned above.

For the past two months the Belmont nail department of the Wheeling Steel & Iron Company has been undergoing repairs. These have been completed and in all probability this department will resume operations in the near future. The Belmont blast furnace of this concern has also been undergoing repairs for some time, which have been completed and the furnace is again ready for operation.

We are advised that the report that Horace and Arthur Brock of Lebanon, Pa., had leased the Colebrook furnaces for a term of 20 years, and that the firm of Coleman & Brock would be dissolved, is entirely without foundation. It will be remembered that the Colebrook furnaces are at Lebanon and are operated by Robert H. Coleman.

The Eureka Cast Steel Company of Chester, Pa., are, besides repairing the damage caused by the recent fire at their works, increasing their open hearth plant to three times its former capacity. They expect to commence running about the first week in November.

The puddling department of the Passaic Rolling Mill Company, at Paterson, N. J., has closed down.

The Pittsburgh Iron & Steel Engineering Company of Pittsburgh are erecting a number of iron buildings for Wm. Clark's Son & Co. of the Solar Iron Works in that city. These buildings are three in number, being 100 x 100, 60 x 218 and 56 x 260 feet in size, and will replace former frame structures recently damaged by fire. The first mentioned firm have also closed a contract with Geo. A. Macbeth & Co., glass manufacturers, of Pittsburgh, for the erection of seven iron buildings covering their entire equipment.

The Ohio Iron Company, Zanesville, Ohio, manufacturers of bar iron, are operating two mills. These works are being run on a non union basis. At one time many of the workmen were colored, but the company now find no difficulty in securing enough non-union white men to fill the crews for such part of their plant as they desire to operate. A full force of men could be easily secured if required.

It is stated that the steel rail mill located at Alexandria, Ind., last spring by the DePauws, and which was partially completed when the DePauw failure occurred, will be finished by the Union Trust Company, who were made assignees of the DePauws.

The Cambridge Iron & Steel Company, Cambridge, Ohio, are operating three of their four sheet mills and are adding another pot to their galvanizing shop. This plant is equipped with the Bayliss patent pots manufactured by Davis & Co., Wolverhampton, England. It is claimed that this system effects a great saving of labor, as the sheets are carried automatically from the pickling vats through the metal pots to the shipping department. Another claim is perfect distribution of metal over the surface of the sheets, all parts being coated evenly. This department is under charge of Thos. E. Cook, formerly of Saginaw, Mich.

It is stated that operations have been resumed in full at the North Branch Steel Works and the Mahoning Rolling Mill in Danville, Pa.

The American Sheet Iron Works of Phillipsburg, N. J., will, it is said, resume operations this week. About 100 hands are employed at these works.

One of the three stacks of the Andover Iron Company, at Phillipsburg, N. J., has been placed in blast.

The Bethlehem Iron Company of Bethlehem, Pa., have shipped to the Watervliet Arsenal, at West Troy, N. Y., for use in the 10 and 12 inch guns, 111 tons of material, consisting of tubes, jackets, hoops, &c.

The Woodward Iron Company have relined and blown in one of their furnaces at Woodward, Ala., and the second furnace will blow in as soon as the work of relining is completed.

The Monongahela Iron & Steel Company of Pittsburgh, manufacturers of muck iron, whose plant is located at Hays Station, on the Pittsburgh & Lake Erie Railroad, signed the Amalgamated Association scale last week. The plant of the firm contains 20 single puddling furnaces and one train of muck rolls, with an annual capacity of 15,000 net tons. It is stated that this plant will resume operations within a short time.

The Thomas Iron Company of Catasauqua, Pa., have resumed work on the erection of their No. 1 blast furnace at Hokendauqua, Pa.

Last week the puddlers in the employ of Brown & Co., Incorporated, of the Wayne Iron & Steel Works, at Pittsburgh, were requested by the manager to sign a paper agreeing not to join any labor organization of any kind while in the employ of that firm. The puddlers refused to sign the paper, and the puddling department, in consequence, has been temporarily closed down.

Recently Philips, Nimick & Co., operating the Sligo Rolling Mills, at Pittsburgh, notified their puddlers that it would be necessary for them to accept a reduction of 10 per cent. in prices paid for boiling, in order that the firm could compete with non-union mills in the Pittsburgh district and other places, where boiling is being done at considerably less than $5 per ton. So far the men have refused to grant the request of the firm for a reduction, and at this time the puddling plant is closed down. It is not improbable that when operations are resumed it will be with non-union men.

Application for a charter for an intended corporation to be known as the Diamond Steel Company of Reading, Pa., has been made. The new concern propose to engage in the manufacture of iron, steel, or both. The plant of Rothenberger, Steel & Sassaman, in North Reading, will be transferred to this new corporation, and the mill will probably resume operations at an early date, as it is stated that a number of orders have already been received.

During this week the South Fifteenth street mills of the Oliver Iron & Steel Company, at Pittsburgh, will probable be put in operation in both the puddling and finishing departments. Only non-union men will be employed, as this firm some time ago refused to treat with the Amalgamated Association or recognize it in any capacity. It is also likely that the lower mills of this firm, situated in Allegheny, Pa., will be put in partial operation within a short time.

The rolling mill of the Oxford Iron & Nail Company, Oxford, N. J., has started up.

The Bessemer department and the rail mill of the Bethlehem Iron Company, at Bethlehvem, Pa., have resumed operations after an idleness of two months.

Operations at the large plant of the Ætna-Standard Iron & Steel Company, Bridgeport, Ohio, are now being conducted as follow: In the Ætna department all of the bar mills and two sheet mills are in operation. In the Standard department everything is on in full, including the galvanizing and corrugating departments. This leaves but four sheet mills in the Ætna department as the only idle parts of the plant. This firm announce that they are prepared to fill orders for their different lines of manufacture promptly, and expect to keep those portions of the plant now running in full operation.

The blast furnace of the Jefferson Iron Works, at Steubenville, Ohio, has recently been relined and otherwise extensively remodeled and improved. Included in the improvements are two batteries of water tube boilers, supplied by the Babcock & Wilcox Boiler Company, with a total combined horse-power of 500. Waste gas from the furnace will furnish the fuel for these boilers, and in the utilization of this gas some improved methods of handling will be used. It is said that this blast furnace will be put in operation in a short time.

A recent visit to the new plant of the New Castle Steel & Tin Plate Company, at New Castle, Pa., developed the fact that this concern have one of the most complete plants in every respect in the country for the manufacture of tin and terne plate. The buildings are all of iron and as nearly fire proof as could be made. The welfare of the employees was carefully looked after in the construction of the buildings, and they are so arranged that a very comfortable temperature can be maintained during the summer and winter months. The entire equipment is of the most modern design throughout, and will permit of the handling of both raw and finished material to the best possible advantage. The location of the plant is an admirable one, the concern having switch connections with three different lines of railroads. The plant of the Shenango Valley Steel Company lies just alongside, and this will enable the firm to purchase their billets at the very lowest market prices and at the same time insure a material saving in freight charges. As yet only black sheets for tinning purposes have been turned out, but in a short time the tinning department will be put in operation. It is the intention of the firm to make a full line of the different grades of tin and terne plate, and they will also be sellers of black sheets in the open market.

The plant of the Catasauqua Mfg. Company, at Catasauqua, Pa., has started up.

The business men of Belleville, Ill., have decided to raise $15,000 to liquidate part of the indebtedness of the Belleville Steel Company, the creditors having agreed to permit a resumption of the steel works when that amount is made up.

Machinery.

The disastrous fire which recently occurred in West Forty-first street, New York, extended to the building Nos. 512, 514 and 516, occupied by P. Pryibil as warerooms and storerooms for finished machines and patterns and shafting department. The building Nos. 520–524, in which are located the principal machine tools, as well as the drafting room, pattern shop, office, &c., was uninjured. The works comprised two five-story brick buildings, each 75 x 75 feet, with ample space between and behind them and connected by a tunnel and bridges. For this reason the structure known as the west building escaped damage. Mr. Pryibil has issued a circular in which he states that in 38 years of business he has never experienced a fire before. He anticipates little or no trouble in filling orders.

Morse, Williams & Co., Philadelphia, manufacturers of elevators, have been running their plant on full time and are contemplating an enlargement in the near future. The company state that prices have been very unsatisfactory and collections slow, but an improvement is noticeable in the latter, and they believe that it is only necessary to restore confidence, through the prompt action of Congress, to bring about a speedy restoration of business.

The Chapman Valve Mfg. Company of Boston, with works located at Indian Orchard, Mass., report a very busy season; not only have the works run to their fullest capacity with their full quota of employees, but the increasing demand has made it necessary to run many nights to keep abreast with the orders. The reason for this business activity during the general depression is owing to the fact that the demand has been for specialties that this company make. Since the increasing importance of using steam under high pressure, Jason Giles, the company's general manager, conceived the idea of making a gate valve with a removable bronze seat, which should be especially adapted for high steam pressure. Such a valve was made and patented by him March 18, 1890, and afterward assigned to the Chapman Valve Mfg. Company About all of the largest electric light and power plants in this country are equipped with Chapman valves. Another specialty, the increasing demand for which has contributed to the company's activity during the present season is the indicator valve, which was also patented by Mr. Giles The demand has been very large and from all sections of the country, and although the company have increased their capacity very largely this season in erecting a brick building 234 feet long by 50 feet wide, yet at this time every

Hosted by Google

department is crowded to its utmost and still they are unable to keep up with the constantly increasing demand, and already have booked orders which will keep the present force of upward of 300 employees busy during the entire winter season and until spring trade opens.

The Stow Mfg. Company of Binghamton N. Y., manufacturers of the Stow flexible shaft, report that their trade up to October 1 shows an increase over that of the corresponding months of 1892. During the past two months they have greatly improved their plant, adding largely to their boiler capacity, &c. They report a decided improvement in October sales over those of the preceding month.

Palmer & Co., dealers in machinists' tools, mills, factory and railroad supplies, of Philadelphia, are now at 26 North Seventh street, in that city. J. C. Palmer, the head of the concern, was a partner in the firm of Palmer, Cunningham & Co. of Philadelphia, lately dissolved by limitation. They are making a specialty of cold rolled steel, sharpened and hardened, and finished steel balls for bearings.

Maris & Beckley of Philadelphia are completing two 6-ton traveling cranes for the Altoona Mfg. Company, Altoona, Pa. These cranes are built with two speed hoists. They have also approaching completion a 5-ton power crane for use over a pipe facing lathe, for the McNeal Pipe & Foundry Company of Burlington, N. J. In this crane all the movements are controlled by one man from the floor, through levers fastened to the wall. Among recent shipments made by the firm was a crane to the Continental Iron Works, Brooklyn. They report inquiries for quite a number of their cranes, many of them from abroad, among which they mention one from Aberdeen, Scotland, for three cranes.

The Garvin Machine Company of New York have opened a salesroom in Philadelphia at 51 North Seventh street.

A number of the boiler makers at Wickes Brothers' Foundry & Machine Works, Saginaw, Mich., went on strike on account of a reduction in pay for overtime on contract work.

The foundry known as the Mims' Iron Works Company, Limited, at New Orleans, La., has been destroyed by fire. The principal loss is on patterns and stock, since the structures burned were very old. The works did a large business in the manufacture of steamboat, sugar house and rice mill machinery.

On the petition of the assignee of Pedrick & Ayer of Philadelphia, manufacturing machinists, who assigned September 5, Judge Reed has made an order restraining the Sheriff's sale of the effects of the firm, and authorizing the assignee to make up all the stock on hand and transfer the proceeds to the execution creditors. This order was made owing to the fact that when the assignment was made there was a large quantity of working stock on hand, and the firm had a number of unfilled orders, and that at a public sale which was to have taken place under the execution the creditors would sustain a great loss. An appraisement of the assigned estate was filed, showing assets aggregating $93,599.94.

The Hendey Machine Company, manufacturers of machine tools, at Torrington, Conn., have been running their works for the past two months five days per week and eight hours per day, and have about three-quarters of their full force at work. They have sold a few machines in this country during the past two months, and have sent a number abroad, but their business has been unusually light compared with previous records. The company look for very little improvement in trade during the balance of the year, but believe that business will pick up rapidly after the inauguration of the new year.

The buildings for the new plant of the Dean Bros. Steam Pump Works, Indianapolis, Ind., will be completed about December 1. They will be more than double the size and capacity of the present works.

The Cincinnati Milling Machine Company of Cincinnati, Ohio, makers of machine tools, started their works about three weeks ago with two-thirds of the usual force, and are now running five days a week. With the orders in sight the company feel encouraged to believe that they will be able to continue in operation on this basis at least to January 1.

The Detroit Dynamo Company of Detroit, Mich., have just moved into their new factory, 121 to 125 Champlain street, where they have about double the former amount of floor space. They now have equipped a complete machine shop, where they not only turn out their own machines complete, but are prepared to do a full line of repair work on all kinds of electrical machinery. The company have an order for equipping a new foundry in Detroit complete with motor power instead of steam and rope transmission. The company are acquiring a reputation for their electric lighting dynamos for isolated plants, and hope during the next year to almost double their business in this line.

L. Schneider has begun work at Winona, Minn., on a new boiler factory, 100 x 40 feet in size

D. J. Bolenger's foundry, at Waynesburg, Ohio, has been destroyed by fire. Loss, $5000; insurance, $500.

Steps have been taken to establish at Columbia, S. C., foundry, machine and repair shops and depot for agricultural machinery of all kinds, the purpose of the scheme being to furnish to farmers of the State machinery at small cost. The capital of the company is to be $10,000, business to begin as soon as $4000 has been paid in.

Ground has been broken at Toledo, Ohio, for the construction of the new foundry and machine works of M. M. Donovan & Co. The main building will be three stories high and the foundry one story.

W. B. Pollock & Co. of Youngstown, Ohio, have started their boiler works.

The Lambert Point Iron Works, at Norfolk, Va., have been destroyed by fire. The plant was owned by Clark & Cunningham, and valued at about $10,000.

A boiler and iron works is to be established at Meridian, Miss., by W. R. K. Standford.

Byram & Co., Detroit, Mich., have recently furnished a Colliau cupola to Wm. Clendinneng & Son, Montreal, P. Q., the Eastwood Wire Mfg. Company, Belleville, N. J.; two for the Ingersoll-Sargeant Drill Company, New York City, for their new shops at Easton, Pa.; the second one for Messrs. F. E Meyer & Bros., Ashland, Ohio, and the Clinton Plow Company, Clinton, Mich.

The works of F. E. Myers & Brother, Ashland, Ohio, manufacturers of pumps of various kinds, are now in operation, with a larger capacity for production of pumps than ever before. Some additions have recently been made to their equipment, among which is included a new 15-ton Colliau cupola in their foundry, and the refitting of the cleaning room with considerable modern machinery.

The Harrison Machine Works, at Belleville, Ill., which shut down two weeks ago, have resumed in all departments.

Davies & Thomas, founders and machinists, of Catasauqua, Pa., have received a contract for the foundry work for a new zinc works to be erected at Passaic, N. J.

In the courts at Pittsburgh last week, a petition was filed asking for the removal of the receiver for the Nations Mower & Reaper Company, whose plant is located at Latrobe, Pa. The petition was filed by Martin Cutter, who asserts that he was the owner of certain patents which he assigned to the company for $15,000 worth of stock and $120,000 in cash. There is still $79,000 owing him, which the company cannot pay at present. The debts of the company are about $8000, and it is claimed that if the stock was all paid up the proceeds would pay the debts. Mr. Cutter asks that the property be placed in his hands as tenant.

The Pittsburgh Porcelain Enameling Mfg. Company of Pittsburgh have been granted a charter, with a capital of $10,000. The directors are David Boyd, Wm. Boyd and Ross W. Patton, all of Pittsburgh.

The brass manufacturers of Canada, at a recent meeting held at Toronto, decided to request the Canadian Government to withdraw the duty of 10 per cent. on raw material.

All the shopmen on the Union Pacific system, some 4000 in number, have been put on full time.

Hardware.

Landers, Frary & Clark, New Britain, Conn., are now running their cutlery works four days a week instead of three, but business in the other departments of the plant is duller, so that there is a shut down of three days per week.

The Hinkle & Gaither Mfg. Company, Laurel, Md., manufacturers of agricultural implements, have nearly completed repairs to their buildings, and have all their machinery ready for operation. They will employ at the start about 50 men.

The Penn Hardware Company, Reading, Pa., have resumed operations.

The Crystal Mica Company's plant, at Warren, N. H., which has been idle through the summer, has started up and is running on full time.

The G. S. Foos Company, Springfield, Ohio, have disposed of their business to John Spencer and George O. Leedle, late treasurer of the company, who will incorporate a new organization to assume control November 1, when the manufacture of all kinds of wringers, lawn mowers, &c., will be continued. Ample capital and increased modern facilities will be provided. Mr. Spencer is referred to as a thoroughly practical and experienced mechanic.

The Rock Island Plow Works, Rock Island, Ill., resumed operations on the 16th inst. after a two-months shut down. About 250 men, less than half the usual force, are employed. The company have made a reduction of 10 per cent. in wages, and have shortened the working day for the present, so that the men work eight instead of ten hours.

The new warehouse of the Hatch Cutlery Works, South Milwaukee, Wis., was damaged by fire a short time since to the extent of $3000, a loss which is fully covered by insurance. The warehouse was used for storing grindstones and unfinished shears.

Foster Brothers' Knife Works, at Oswego Falls, N. Y., were slightly damaged by fire on the 17th inst. The fire is supposed to have originated from smoldering sparks in the emery room. The prompt action of the fire department prevented what might have been a serious conflagration. The works are again in running order.

The Seabury Gun Company have been incorporated, with a capital of $300,000. The company will manufacture arms of all descriptions in New York City. The incorporators are E. H. Litchfield, J. B. Grosvenor, H. Wallis and others.

The Scranton Axle Works, Scranton, Pa., have resumed operations after a brief suspension, which was rendered necessary in order to make needed repairs. Important improvements in the works are contemplated which will increase their output.

The Belmont Nail Works, Wheeling, W. Va., a part of the Wheeling Iron & Steel Company, started up on the 16th inst., after an idleness of five months and partial idleness of a year. They are giving employment to over 500 men.

The Gleeson Wire Cloth Mfg. Company have filed a certificate of incorporation in the Hudson County Clerk's office in Jersey City, N. J. The company propose to establish a factory at Harrison, N. J., for manufacturing wires of various patterns. The company will begin business with a capital of $15,000. The incorporators are John Martin Moore of Kearney, George F. Wilson, Martin Desmond and Thomas F. Bulger of Harrison, N. J., and Francis A. Harris of Waterbury, Conn.

During the summer months extensive improvements and additions were made to the wire nail factory of the New Castle Wire Nail Company, at New Castle, Pa., whereby the capacity has been considerably increased. The plant of this concern is now in full operation and is turning out an average of 3200 kegs of wire nails every day. Since the initial establishment of this plant at New Castle it has been found necessary to increase the capacity from time to time in order that the firm could turn out their product as fast as wanted by the trade, and at this time their nails are sold in every part of the United States where wire nails are used.

The Standard Wire Company, New Castle, Pa., manufacturers of wire mats, report an excellent demand for their goods, and are operating their works to full capacity. Although this concern have been established but a short time, they have already built up quite a large trade, and propose in a short time to take up the manufacture of tree guards and other wire goods. The firm recently made a shipment of two of their flexible wire mats which measured 47½ feet in length and 6 feet in width. They have also received in the last few days a third order for a mat of this size, and are making shipments of the smaller sizes right along.

The Standard Horse Shoe Company, South Wareham, Mass., for whom Leeds, Robin-

Hosted by Google

son & Co., 4 Liberty street, Boston, are general agents, report that all their machines are being run full time. Improvements are going on at their plant, and additional new machines will be installed as soon as received from the makers. Their shoes are made from old horseshoes, insuring quality, and John Wike is patentee of the machines used and superintendent of the works.

E. T. Barnum, wire works, of Detroit, Mich., has just received an award upon steel prison jail cells or lockups and grocers' cheese safes, as well as upon his general exhibit at the World's Fair.

Miscellaneous.

The Providence Steam Engine Company are building two additional engines, each of 1100 horse-power, for the Union Company (electric railway) of Providence. These will be coupled direct to the dynamos. This company have made provision for engines and boilers of 7000 horse-power.

The plant of the Indianapolis, Ind., Steel Roofing Company has been damaged $3000 by fire.

A. Leschen & Sons Rope Company of St. Louis, Mo., express themselves as being well satisfied with the volume of trade. Their trade for their Hercules wire rope is constantly on the increase, and judging from the inquiries received the company look for a good trade next year.

The C. & C. Electric Company's branch office in Philadelphia is now at 633 Arch street, in that city.

It is now thought that the Litchfield Car Works of Litchfield, Ill., which have been casting about for some time for a suitable location for a new plant, will settle at Memphis, Tenn.

Negotiations are in progress for the establishment of a brass foundry at St. Paul, Minn., by Jacob Kritch of Port Townsend, Wash.

The Cambridge Roofing Company, Cambridge, Ohio, have added numerous sheet metal specialties to their line of manufactures, which are principally iron and steel roofing, plain and corrugated. This company are now prepared to furnish eave trough, conductor pipe and all other material required to complete a metal roof.

A. B. Laurence of New York has furnished to the United States Government 4000 feet of Shultz Sable rawhide belting for the Watervliet Arsenal, West Troy, N. Y. The quantity required will aggregate about 4000 feet, with gross value of $8000. A 24-inch belt has been in use there for some five or six years, and has recently been removed to the Springfield, Mass., Arsenal. On the Sun Insurance Company's dynamo there is one of the recently patented Shultz grooved dynamo belts, which is quite novel in method of reducing the much talked of air cushion. This is made with grooves running lengthwise of the belt.

A license to incorporate under the laws of Illinois has been issued to the R. Herschel Mfg Company, at Peoria; capital stock, $30,000; to manufacture and sell mower knives, reapers, sickles, molding bits, coil springs, agricultural implements and supplies. Incorporators, Paul B. Herschel, H. R. Herschel, Martin Sohn and John Mertes.

It is expected that within a short time announcement will be made of the appointment of P. R. Dillon as general superintendent of the various plants of the Carnegie Steel Company, Limited, at Pittsburgh. These include the Edgar Thomson Steel Works, Homestead Steel Works, Duquesne Steel Works, Upper and Lower Union Mills and Beaver Falls Mills. It is probable that this appointment will result in other changes among minor officials being made.

The city of Indianapolis is said to be absolutely bankrupt. The new Controller in taking charge discovered that the cash resources of the city amounted to but $2000 in hand, while an indebtedness of nearly $900,000 falls due within six months. Steps are being taken to raise funds for necessary municipal expenses, particularly those of the approaching elections.

TRADE REPORT

The certainty that the purchasing clause of the Sherman bill will be repealed unconditionally has revived hope, and is received with satisfaction Some authorities in the Iron trade expect an increased volume of orders and a more cheerful tone. Others believe that repeal now has simply saved us from additional disasters. It is probable that a good effect may be produced in another direction. There is evidence that during the protracted period of doubt over the fate of the silver question sales of Steel were made at very low prices for delivery very far into next year. Now that this danger is over a more conservative course may be followed.

Another question will come to the front which is expected to influence adversely developments in the Iron trade. There are many clear headed men engaged in the business who are convinced that nothing so radical in the way of tariff revision will be formulated by Congress that it will hurt the industry. A large majority of earnest and sincere persons, however, do believe that any change in the present rates of duty will do quick and lasting harm. Until it is known what those changes are to be their effect cannot be measured.

This broad statement may be made, so far as this winter's business is concerned, that no cut in rates likely to be passed will enable a buyer to purchase at lower prices than those now prevailing through the influence of fierce domestic competition at a time of unparalleled depression. As for the reflex action upon the Iron trade of disastrous effects upon other national industries, the case may be entirely different. It is remote, however, and should not affect perceptibly business which is pending or must come out for early settlement.

A little more work has come out lately in many directions, but it is far from being enough to put even a semblance of backbone into sellers Some of the Rail mills have induced their customers to let them roll material for next year's delivery. Upon what terms this is being done has not transpired. It is evidently being done to keep the works organization together.

Until the money now accumulating so rapidly in our financial centers is again employed in commerce and industry no marked improvement can take place in those branches of the Iron trade which depend upon the railroads, upon engineering and municipal undertakings, upon buildings and upon the machinery branch for their customers. In many departments the busy season is practically over, and approaching spring can only bring relief. For a large section of the Iron trade the winter months seem bound to be dull. There seems little danger that another false start will be made.

While it is a matter of congratulation and rejoicing that we have escaped the perils which would have followed any compromise on the silver question, it must be remembered that confidence is a tender plant of slow growth. Unduly sanguine expectations of quick recovery now will only delay the day when the buyer will cease to be the autocrat. He is having his turn now, and is making the most of it, in some cases repudiating contracts in an unparalleled fashion.

Chicago.

(By Telegraph.)

Office of *The Iron Age*, 59 Dearborn street, CHICAGO, October 25, 1893.

Pig Iron.—The business of the past week has been of an irregular character. Some houses have been so fortunate as to capture a few good orders. One of these was for 1000 tons of local Coke and another for 500 tons. Ordinarily such transactions would not be considered of importance, but in the present condition of trade they are eminently worthy of mention. Business generally has been confined to carload orders, and even these have by no means been numerous. Inquiries are in the market for a couple of lots of 500 tons of Soft Southern Iron, and one inquiry is reported for 1000 tons of Lake Superior Charcoal. These inquiries are exciting more than usual attention from the trade, and competition for them promises to be lively. The sale of 2000 tons of Southern Gray Forge at $10 at Cleveland has stirred up this market quite considerably, as it showed what possibilities are in store here. Quotations are now as follows for cash:

Lake Superior Charcoal.....	$16.00 @	$16.50
Local Coke Foundry, No. 1...	13.50 @	14.00
Local Coke Foundry, No. 2...	12.75 @	13.00
Local Coke Foundry, No. 3...	12.25 @	12.75
Local Scotch.....	14.00 @	14.50
Ohio Strong Softeners No. 1..	15.50 @	16.00
Southern Silvery, No. 1.	@	14.50
Southern Silvery, No. 2	@	14.00
Southern Coke, No. 2.....	12.10 @	12.60
Southern Coke, No. 3	11.60 @	11.85
Southern, No. 1, Soft.....	12.35 @	12.60
Southern, No. 2, Soft.....	11.85 @	12.10
Southern Gray Forge	11.10 @	11.35
Tennessee Charcoal, No. 1...	16.00 @	16.50
Alabama Car Wheel.....	18.50 @	18.75
Hocking Valley, No. 1 ...	15 25 @	16.00
Jackson County Silvery.....	16.00 @	17.00

Bars.—Inquiries have been fair, and quite a number of sales are noted. Among these was one of 200 tons to a wagon manufacturer. The volume of business is less than that of two or three weeks since, but is still large enough to keep the local mills employed. Competition on business has reduced prices, and Common Bar Iron has been sold at 1.35¢, Chicago, although carloads bring more than this and may be quoted at 1.42½¢ @ 1.45¢, half extras, Chicago. Soft Steel Bars have participated in the weakness, and may now be had at 1.50¢ or lower. Jobbers note an improved demand from stock. Their business has of late come largely from Agricultural Implement manufacturers, some of whom are buying in this way as their wants require rather than place contracts with mills. Store prices on Iron are now 1.60¢ @ 1.70¢, and Soft Steel 1.65¢ @ 1.70¢.

Structural Material.—One fair contract for Beams has been placed for a new factory building. Small lots have been fairly active, but business in this line is now falling off with the approaching close of the building season. Bridge work is dull. Quotations are maintained at the following prices on mill shipments, Chicago delivery: Beams, 1.75¢ @ 1.90¢; Tees, 1.95¢ @ 2.05¢; Angles and Universal Plates, 1.75¢ @ 1.80¢.

Plates.—Almost nothing is doing in this line; an inquiry for 100 tons is extremely rare. The demand even for small lots from stock has fallen off. Mill shipments, Chicago delivery, are quoted as follows: Tank Steel, 1.75¢ @ 1.80¢; Shell Steel, 2¢ @ 2.10¢; Flange Steel, 2.15¢ @ 2.30¢; Fire Box, 2.75¢ @ 5¢. Store prices now prevail as follows: Iron or Steel Sheets, Nos. 10 to 14, 2.25¢ @ 2.40¢; Tank Steel, 2.10¢ @ 2.20¢; Shell Steel, 2.20¢ @ 2.40¢;

Hosted by Google

Flange Steel, 2.50¢ @ 2.65¢; Boiler Tubes, 70 %.

Sheets.—Trade in Black Sheets has been spasmodic. The mill business doing latterly has been almost entirely with jobbers, who have been buying as they needed stock, instead of as in former years placing time contracts. Mill shipments, Chicago delivery, are quoted at 2.75¢ for No. 27 Common. The demand for small lots from stock has been very good of late, but appears to be running more to Smooth Iron and Sheet Steel than Common Iron. The price on carloads of Common from stock is 2.90¢ @ 3¢. Galvanized Iron continues to be in good demand and prices are maintained at 75 % off for mill shipment with freight added. Copper Sheets are weaker and small lots are selling at 35 % off.

Merchant Steel.—Business in this line continues about as previously reported. New business is not coming forward to any considerable extent. The Joliet works of the Illinois Steel Company will be put in operation shortly after the beginning of next month on Billets, quite a number of orders having been entered at $20. Mill shipments, Chicago delivery, are quoted as follows: Smooth Finished Machinery, Tire and Open Hearth Spring Steel at 1.90¢ @ 2¢; Ordinary Bessemer Machinery, 1.60¢ @ 1 65¢; Ordinary Bessemer Tire, 1.55¢ @ 1.60¢; Ordinary Tool Steel, 6¢ @ 7¢; Specials, 12¢ and upward.

Rails and Track Supplies.—It is reported that a contract for 2000 tons Steel Rails for a Western railroad was placed with Pittsburgh manufacturers, as the local mills would not start up to roll so small a quantity. Outside of this very little business has been offering either in standard or light sections. Standard sizes are unchanged at $30 @ $32; and Light Rails, $31.50 @ $32. Iron and Steel Splice Bars, 1.50¢ @ 1.55¢; Track Bolts with Hexagon Nuts, 2.50¢ @ 2.55¢; Spikes, 1.85¢ @ 1.90¢.

Old Rails and Car Wheels.—Transactions in Old Iron Rails are reported at $14. Quite a number of railroads are still holding their stock of Old Rails, firmly refusing to take prevailing prices, but it is expected they will change their views by December, if not before that time. There will then be a desire as usual to secure as much cash as possible in anticipation of interest payments and the necessity of making up favorable annual reports. Sales of Old Steel Rails, selected lengths for rerolling, have been made at $10. Short pieces are quoted at $7.50 @ $8 The most vigorous inquiry fails to disclose any transactions in Old Car Wheels or negotiations on which to base a quotation.

Scrap.—A moderate volume of business is reported in almost every kind of Scrap Iron or Steel, for which there seems to be absolutely no demand whatever. Buyers of Scrap, however, are very conservative, and especially the foundries, who are taking only what they need from day to day, and will not anticipate their requirements to any extent. Dealers' selling prices, net ten, are as follows: No. 1 Forge, $10.50; No. 1 Mill, $8; Sheet Iron, $5; Pipes and Flues, $8; Axles, $10; Horseshoes, $11; Fish Plates, $13; Spikes and Bolts, $10; Cast Borings, $5; Wrought Turnings, $6.50; Axle Turnings, $8; Heavy Cast, $9.50; Stove Plate, $7.75; Malleable Cast, $8; Mixed Steel, $7, gross ton; Leaf Steel, $14 50.

Metals.—No trade is reported in Copper. In the absence of transactions carload lots of Lake continue to be quoted at 10⅜¢, and casting brands at 9¾¢. Very little is doing in Spelter, which is down to 3 40¢. Consumers of Lead are holding off and business in that line has been extremely quiet, with quotations at 3 25¢ @ 3 30¢, according to quantity.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., October 24, 1893.

There is but little of interest to report from this center of the Iron trade, and taking the market as a whole no change of any moment can be noted. The trade recognize the fact that wear and tear is going on all the time, and that renewals will have to be made sooner or later, but as yet there is no indication of anything but a makeshift market. Anything that is not absolutely necessary is not bought, no matter how low the price may be, so that business continues on a smaller scale than for years past. After so many weeks of depression it would be pleasant to note a change for the better, but a strict adherence to facts will not permit anything of that kind. There is the same demand as there has been for several weeks past, no more, no less, and the same may be said in regard to prices. After so long a run of poor business and low prices the natural expectation is that there ought to be an improvement, particularly as the financial situation is becoming stronger, but while the future may be all right the present is to all intents and purposes just about as it has been for several weeks past.

Pig Iron.—The market is dull, listless and apathetic. Consumers appear to be absolutely indifferent in regard to the future course of the market. All they care to do is to provide for current requirements, leaving the future to take care of itself. There is a general assent to the statement that prices are not likely to be lower, but, on the other hand, there is no willingness to increase purchases, because there are no indications of an upward movement; hence they say: "What is the use of buying beyond what we require for immediate use?" Sellers find it impossible to make much headway on such a market, and are therefore taking such business as they can get at current quotations, or as near to it as may be. This in the aggregate is very trifling compared with any similar period during the past three or four years, notwithstanding the fact that prices are at the lowest ever known. To say that things will be better in a little while would be simply a guess, as there is nothing upon which to predicate any change whatever. Things can hardly be worse than they are, and we join with everybody else in the hope that they will soon be better, and that is about all that we feel warranted in saying. Sales are mostly at about the following quotations for Philadelphia or nearby deliveries, with occasional sales of round lots at 25¢ @ 50¢ less money: $12 @ $12.50, delivered, for standard brands of Gray Forge; $13 @ $13.50 for No. 2 Foundry, and $14 @ $14.50 for No. 1. Southern Irons can be had at less money, several lots having changed hands at $11.50 @ $11.75, with a fair chance that orders could be placed at the same figures for good sized lots and prompt settlements.

Steel Billets.—There is not much demand, but quotations are firmer, say $20 @ $20.25, delivered. A few small lots have been taken on this basis, but for 1000-ton lots and larger $20 could probably be shaded to the right kind of a buyer. Mills are so poorly employed that they have comparatively little use for material, so that anything over 500-ton lots is rather exceptional these days. Last sale reported was 500 tons, a day or two ago, at $20, to mill near by.

Finished Material.—The general report is that the demand is slow and disappointing, although in some cases mills are kept fully employed in meeting the current demand for small lots. This is exceptional, however, and the majority report a light demand at weak and unsatisfactory prices. There is no large work of any amount coming out, so that mills have to either run on old contracts (chiefly for shipyards) or such new business as can be had from day to day. Architectural work figures more prominently than almost anything else, but deliveries are so far ahead that it may be weeks before specifications will be sent in, so that, as we said before, there is little or nothing to depend on for immediate work except the daily run of small orders. This applies to all departments, Plates, Shapes, Sheets, Bars, everything, in fact, with no immediate prospect of anything better. Prices are very weak, and on anything attractive as to quantity, specification or delivery further concessions have been made, so that we may again say that new figures have been made, and lower than ever before. Ship Plate has been delivered from Pittsburgh to one of the Philadelphia shipyards at less than 1.55¢, and local mills have quoted about the same figure for Tank Steel. There is no price to anything, in fact, and to find how low the market really is it only needs the presentation of a nice specification of a good-sized lot and a firm offer. Small lots are quoted and usually sold at about the following figures:

Grooved Skelp, delivered	1.47½¢	@	1.50¢
Best Refined Bars	1.55¢	@	1.60¢
At interior points	1.50¢	@	1.55¢
Tank Steel	1.60¢	@	1.65¢
Heavy Plates	1.65¢	@	1.70¢
Shell	1.75¢	@	1.85¢
Flange	2.00¢	@	2.20¢

Old Material.—The market shows no improvement, and while prices are nominally unchanged, business is possible only when concessions are made. Some holders are not doing anything at all, on the ground that business at current prices is not worth handling. Nominal prices are about as follows:

No. 1 Wrought Scrap, delivered	$12.00	@	$13.00
Machinery Cast, delivered	10.00	@	11.00
Heavy Steel Scrap, delivered	13.00	@	14.00
Old Iron Rails, delivered	15.00	@	16.00
Old Street Rails, delivered	17.00	@	18.00
Wrought Turnings, delivered	10.00	@	11.00
Cast Borings, delivered	6.00	@	7.00
No. 2 Light Scrap	6.00	@	7.00

Edward Corning & Co. have removed their Philadelphia office from 237 South Third street to the Philadelphia Bank

Hosted by Google

Building, 421 Chestnut street. They announce that they are now ready to bid for all building work, either wrought, cast or ornamental. They will retain the agencies of the Allentown Rolling Mill Company and the Lebanon Iron Company, as heretofore.

St. Louis.

(*By Telegraph.*)

Office of *The Iron Age*, Bank of Commerce Building, St. Louis, October 25, 1893.

Pig Iron.—Sales continue to be limited and prices are weaker. Some extremely low prices have been made which in ordinary times would have secured large orders, but it is doubtful if a cut of $1 ℔ ton from current prices would have any effect on the size of an order. Consumers are buying only as they need the Iron, and some of them need very little. We quote as follows for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry	$13.25 @ $13.50
Southern Coke, No. 2 Foundry	11.50 @ 11.75
Southern Coke, No. 3 Foundry	10.75 @ 10.95
Southern Gray Forge	10.25 @ 11.50
Southern Car Wheel	17.25 @ 18.25
Lake Superior Car Wheel	16.50 @ 17.00
Ohio Softeners	16.00 @ 16.50

Bar Iron.—There is no improvement in this department. Mills are only running part time, and it is more than likely will continue to do so during the balance of the year. Store trade is dull and prices are quoted a trifle lower than last reported. Lots from mill command 1.42½¢ @ 1.47½¢, f.o.b. cars East St. Louis. Jobbers ask 1.60¢ @ 1.65¢ for small lots from store.

Barb Wire.—There is no improvement to be noted in the demand for Barb Wire. Mills are making close prices and offering inducements in the way of 60 days, at prices that heretofore have been cash, but trade fails to respond. Jobbers are doing only a small business, and report a gradual weakening tendency in prices. We quote Painted from mill at $1.90 @ $1.95 in carload lots to jobbers. Galvanized at $2.30 @ $2 35. Jobbers ask $2 05 @ $2.10 for Painted, with the usual advance for Galvanized.

Wire Nails.—There continues to be a fair demand for Wire Nails, but prices are anything but encouraging. Some very low prices are reported, but are impossible to verify. Mills ask $1.45 @ $1.50 in carload lots to jobbers. Store price is $1.55 @ $1.60, according to quantity.

Rails and Track Supplies.—Business does not improve, and the demand continues to be of a hand to mouth character. Splice Bars, are quoted at 1.65¢ @ 1.70¢; Spikes, 2¢ @ 2.05¢; Bolts, Square Nuts, 2.50¢; with Hexagon Nuts, 2.60¢. Steel Rails continue to be quoted at $30 @ $31. Old Iron Rails are nominally quoted at $15, but no sales are reported.

Pig Lead.—After selling down to 3¢, this metal has recovered somewhat and is now quoted at 3.10¢, although it is by no means steady at this figure. There is practically no consumptive demand.

Spelter.—This metal remains practically unchanged at 3.25¢ @ 3.30¢. Sales are limited to carload quantities.

Cincinnati.

(*By Telegraph.*)

Office of *The Iron Age*, Fifth and Main Sts., Cincinnati, October 25, 1893.

There is no improvement in the market for Pig Iron, and as long as the obstructionists in the Senate are permitted to have their way there will be none. There has been little more than a current jobbing demand in this district, running from single carloads up to 200 tons for immediate shipment, but no buying for forward delivery, although the indications are that Pig Iron could be obtained at the rates now current for any delivery during the next four months. The occasional offering of some calamity Iron at prices less than the cost of production, although not in first hands, tends to keep up the demoralization of the market and to prevent any recuperation. There was one such lot of Gray Forge sold during the week and while the price was not made public it was intimated that it was as low as it sold during the most extreme depression. While the offerings of Southern Iron are not large or urgent, it is not difficult to obtain a sufficient quantity to meet the requirements of the market, for the demand from the East is smaller than it has been. The only industry that is melting any considerable quantity of Pig Iron is the Iron Pipe works, and it is not expected that this will keep up long. There is scarcely any demand for Charcoal Iron. Quotations are as follows:

Foundry.

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke No. 1	15.00 @ 15.25
Lake Superior Coke No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Forge.

Gray Forge	9 75 @ 10.00
Mottled Coke	9.50 @ 9.75

Pittsburgh.

(*By Mail.*)

Office of *The Iron Age*, Hamilton Building, Pittsburgh, October 24, 1893.

The situation to-day as compared with that of one week ago does not show any marked change one way or the other. The same struggle to get enough business to keep running still goes on, with the inevitable result of keeping prices as low as ever, and with buyers still able to secure concessions when they are prepared to place a moderate sized order with attractive terms.

Never before in the history of the Iron and Steel trades have producers been so completely at the mercy of buyers as they are now and have been for some time past. Contracts for Steel made when prices were from $2 to $3 ℔ ton higher than at present have been canceled and new contracts made, while the original seller looked on, unable to help himself. This also applies largely to almost every line of Iron and Steel manufactures. Had conditions been reversed the seller would have been called upon to observe his contract to the letter, and it would seem that something should be done in the direction of more nearly equalizing this feature of the market by which the manufacturer would be better protected. For the week under review prices have shown no material change, but a general air of weakness pervades the entire market. Nearly all the mills in the Pittsburgh district are operating to greater or less degree, some of them to nearly full capacity, others to half capacity or less.

Pig Iron.—There has been no change in the condition of the market since our last report. Some Iron is being sold right along, but in small lots ranging from 100 to 500 tons. The probabilities of some business being done in Rails, if realized, will, of course, aid in reducing stocks to some extent. There is also more Steel being made now than there was last month, and it is safe to say that in the Pittsburgh district the consumption of Pig Iron has slightly increased over last month. If the present degree of activity among the mills is maintained, and there is no increase in production of Iron, it is not improbable that consumption may catch up with production within a short time, and when this has been attained there will undoubtedly be a better outlook for the Pig Iron trade. If buyers can be brought to realize that prices have reached bottom, we can then look for a better demand, which must come before there can be any betterment in prices. We repeat quotations of last week, as follows:

Neutral Gray Forge	$10.50 @ $10.75,	cash
All-Ore Mill	10.75 @ 11.00	"
Bessemer Pig	11.25 @ 11.50	"
No. 1 Foundry	12.50 @ 13.00	"
No. 2 Foundry	11.50 @ 12.00	"

Billets.—There is nothing of special interest to report. The plants of the four Billet makers in this district are all in operation, and to nearly full capacity. There is a better inquiry for Steel now than a month ago, and the tonnage is considerably heavier. It is evident that Pittsburgh makers of Billets are on a more equitable basis as regards cost of production than ever before, and it is not believed that any one concern has any material advantage over his competitors in this respect. The market is represented by the quotation of $17.75 at maker's mill. For a good sized order, with favorable terms of settlement, it is possible this price would be shaded to a slight extent. In all probability the new Bessemer plant of the National Tube Works Company, at McKeesport, will be started up about November 15 next. The plant has two 8-ton vessels, and is admirably equipped in every way. The product will be largely used by the above concern in the manufacture of Pipes and Tubes. Some good records for production are being made at the plant of the Shenango Valley Steel Company, at New Castle, the output being considerably larger than ever before.

Ferromanganese. — We continue nominal quotation of $55 at mill for domestic. It is not improbable that this price would be shaded if there were any business offering.

Muck Bars —There is nothing doing, and we repeat nominal quotation of $20.50 at maker's mill.

Wire Rods.—We note a sale of 500 tons for prompt delivery at a price equal to $26, cash, at maker's mill. For balance of the year delivery this price would be shaded perhaps 50¢ ℔ ton. There is a good demand for Rods, and some mills have very few to

Hosted by Google

offer for close delivery. The deal involving some 4000 tons referred to in our report of last week has not as yet been closed.

Steel Rails.—The local mill continues in operation and has secured an order for 500 tons of 85-pound Rails to be used on the Pittsburgh Division of the Baltimore & Ohio Railroad.

Plates.—Business is quiet, and the prospects for an increased tonnage are not encouraging. Prices continue low, and for good orders our quotations would no doubt be shaded. We quote as follows: Tank, 1.45¢ @ 1.50¢; Shell, 1.65¢ @ 1 70¢; Flange, 1.80¢; Fire Box, 2.50¢ @ 4.50¢, according to quality.

Structural Material.—The demand continues fairly good, everything considered, and as long as the weather will permit building operations to be carried on there will doubtless continue to be a moderate volume of business. The McIntosh-Verner Building, to be erected on Penn Avenue in this city, will require about 200 tons of material. It will be 120 feet front, 160 feet deep and eight stories high. We quote as follows: Beams up to 15 inches, 1.50¢ @ 1.60¢, according to order. Angles and Universal Plates, 1.60¢ @ 1 65¢; Tees, 1.75¢.

Bars.—Some of the mills have a fairly large amount of work on hand, while others have next to nothing. As yet there are no signs of the idle mills in the Mahoning Valley starting up. We quote Steel Bars at 1.35¢ at mill, with Bar Iron extras. Bars in the Valley are held at 1.35¢ @ 1.40¢, half extras, with reports that stocks at mills are badly broken, certain sizes being about cleaned up.

Merchant Steel.—Business is fairly active, and we are advised of a few season contracts being placed during the past week. Prices are being maintained on the following basis: Open Hearth Spring Steel, 1.90¢ @ 2¢; Bessemer Machinery, 1.65¢ @ 1.75¢; Toe Calk, 1.90¢ @ 2¢; Tool Steel from 5½¢ upward, according to quality.

Barb Wire.—The demand is only moderate, orders being confined nearly altogether to small lots. For ordinary carload lots we quote at $2 25 @ $2.30 for Four-Point Galvanized. Jobbers charge the smaller trade $2.35 @ $2.45 for less than carload lots. Painted is held at $1.85 @ $1.90, in carload lots.

Wire Nails.—We can report a very active demand for Wire Nails, several large orders for season requirements having been placed within the past week. Mills are fully employed, some of them having their product sold up into next month. Notwithstanding the active demand, prices show no signs of advancement. We quote at $1.25 @ $1.30 in carload lots, according to delivery. From the smaller trade $1.35 @ $1.40 is obtained. It is reliably reported that a movement is on foot among the Wire Nail trade looking to the taking of some action by which the severe competition coming from a certain maker will be removed or controlled.

Connellsville Coke.—For the week ending Saturday, October 14, there were 5375 ovens in the Connellsville region in blast, and 12,115 idle, with a total estimated production for the week of 48,460 tons. No new contracts or orders for Furnace Coke have been placed for some time. While some Furnace Coke has been sold as low as $1.10 ℔ ton, certain operators state that as yet they have not been compelled to meet that price. It is probable, however, that an order placed in the market at this time would be accepted at that figure. Prices on Foundry Coke are maintained on the basis of $1.50 to dealers and $1.65 to consumers.

The offices of H. E. Collins & Co., Iron and Steel factors, Pittsburgh, Pa., formerly located on the seventh floor of the Bank of Commerce Building, in that city, have been removed to the third floor in the same building.

N. P. Hyndman of Pittsburgh has recently connected himself with Brown & Cochran, the well-known Connellsville Coke manufacturers, and will represent their Coke sales department in Pittsburgh in their new offices recently opened in the Conestoga Building, corner Wood and Water streets, in this city. The Connellsville Coke manufactured by Brown & Cochran has an excellent reputation among the trade, the concern being one of the oldest Coke producing firms in the Connellsville region. Mr. Hyndman will continue to represent the Hazard Mfg. Company of Wilkesbarre, Pa., manufacturers of wire rope, which agency he has held in Pittsburgh for the past 11 years. Mr. Hyndman recently closed a contract with the Pittsburgh & Castle Shannon Railroad Company for a 2-inch steel rope, weighing about 5½ tons, which will be placed on No. 1 plane of that concern.

Metal Market.

Copper.—Nothing has transpired in the way of new export or home trade movement that reflects any decided change in the condition of the market. Certain it is that fresh purchases have been on a moderate scale and that buyers are extremely indifferent, since deliveries on old contracts satisfy current wants to no small extent, while the offering affords something more than purely circumstantial evidence that the supply keeps fully abreast with the demand. A good showing is made in export statistics and the foreign markets have stiffened somewhat in the face of that fact, but Copper can be purchased as cheaply at present as at any previous time this month. Thus 9¼¢ has become a common selling price for Lake Superior Ingot, while business is said to have been effected *sub rosa* at 9.70¢, regular terms, and at even less net cash terms, prompt shipment; about 250,000 lb were sold. With other varieties the experience has been somewhat similar, Electrolytic selling at 9¼¢ @ 9⅜¢ and common casting stock at 9⅛¢ @ 9¼¢, according to brand.

Pig Tin.—As far as recorded, the speculative dealings have been on a moderate scale and sentiment in the speculative direction seems to be exceedingly tame. Thus far this month less than 100 tons of Tin have been imported. According to most calculations nearly or quite 1000 tons have been turned out from first hands. The statistical position would thus appear to have undergone a further change for the better. It is the plain fact, however, that prices have averaged a shade lower, and that the movement of prices is rather inconsistent with the apparent relation of supply and demand, making altogether a peculiar market. Prices for deliveries this month and next have receded to 20.75¢ and December delivery commands little, if anything, more than 0.10¢ premium, despite estimates of a reduction of at least 1500 tons in spot stocks during the next six weeks. The best bids at the close for current and next month delivery were 20.70¢. There were sellers at 20.75¢ for October and 20.80¢ for November delivery at the close, with jobbing quantities offered at corresponding rates.

Pig Lead.—Nearly if not quite 1500 tons of common domestic have been sold at 3.30¢, delivered here or at common point during the balance of the year. The greater portion was taken by consumers, and not a little went from a prominent firm that purchased 1000 tons or more some time ago when values seemed to have been at a low ebb. Reports have had circulation that mining operations were checked to a greater or less extent by water difficulties; but latest accounts go to show that Idaho and other producers having modern machinery more than hold their own, and that several are in a position to work profitably at present prices, or, say, 3¢ @ 3.05¢ in East St. Louis. This fact is brought out in offset to "bullish" points that have been given more or less circulation of late, and seems to be deserving of more than passing attention. On Wednesday a sale was recorded on the Metal Exchange of 100 tons at 3.35¢, prompt shipment, cash against bill of lading.

Spelter.—There are faint signs that the market for this metal has reached hard pan. The most conspicuous of these is the fact that there are numerous orders for certain Western brands at 3.50¢, delivered here, for export account. It is learned also that the product of several smelters for the balance of the year has been sold up, and that bids of 3.55¢ have been refused in more instances than one. Any price under 3.60¢ for other than inferior brands seems to be exceptional at the moment, and there is not a great deal offered at that.

Antimony.—Demand has been of strictly routine character, and prices just about hold their own. We quote at 10¢ for Hallett's, 10⅛¢ for L. X., and 10¼¢ for Cookson's, in round lots.

Tin Plates.—Coke Plates have met with very fair sale, but the prices that were established about a week ago have not been maintained, for either spot stock or future shipments. In other varieties the movement has been slow and prices for the general line of Bright Charcoals and Ternes are somewhat uncertain, although showing no radical change. Spot quotations are as follows: Coke Tins—Penlan grade, IC, 14 x 20, $5.30; J. B. grade, do., $5.40; Bessemer full weight, $5.35 @ $5.40; light weights, $4.92½ @ $4.95 for 100 lb, $4.85 for 95 lb, $4.70 @ $4.75 for 90 lb. Siemens Steel scarce. Stamping Plates—Bessemer Steel, Coke finish, IC basis, $5.60; Siemens Steel, IC basis, $5.65; IX basis, $6.75 @ $7. Charcoals—Melyn grade, IC, $6.35 @ $6.37½; Crosses, $8; Allaway grade, IC, $5.60; Crosses, $6.75; Grange grade, IC, $5.75; Crosses, $6 85. Charcoal Ternes—Worcester, 14 x 20, scarce; do., 20 x 28, $11.35; M. F., 14 x 20, $7.35; do., 20 x 28, $14.75; Dean grade, 14 x 20, $5.30 @ $5.37½; do., 20 x 28, $10.50 @ $10.60; D. R. D. grade, 14 x 20, $5.15; do., 20 x 28, $10.10; Alyn, 14 x 20, $5.32½ @ $5.35; do., 20 x 28, $10.40; Wasters—S. T. P. grade, 14 x 20, $4.75; do., 20 x 28, $9; Abercarne grade, 14 x 20, $4 60; do., 20 x 28, $8.87½.

Hosted by Google

Financial.

The aspect of things financial shows far brighter at this time than could have been expected from the outlook a week ago. Then uncertainty and uneasiness ruled. The proceedings at Washington gave little promise of any speedy action by the Senate in the matter of repeal. Rumors of compromise were persistently published, and with considerable justification in fact. Last week a feeling of despondency was current which served to depress all business enterprise and speculation; and relief from the suspense seemed far off. Foreign exchange was high, and the money and stock markets dull and weak. The whole outlook was far from reassuring for any imminent improvement in the general monetary situation. Now, however, the scene has changed, and a decided feeling of hopefulness and reassurance has developed. The compromise scheme of Senator Gorman, which, it was announced, was likely to receive the support of a majority, has fallen through. The silver champions have surrendered at discretion, and all signs point to the likelihood of an early vote in the Senate, with an assured majority for immediate and unconditional repeal of the Silver Purchase law.

The sustained confidence of Wall street in the ultimate triumph of repeal—which now appears likely to be justified by the event—has done good service in staving off to a large extent the ill effects of the prolonged delay and inaction. Otherwise the suspense would probably have proved far more serious in its effects on the business community than it has been. As it is, with the silver repeal question in a fair way of satisfactory settlement, and confidence thereby restored, there is good hope for a gradual revival of business from this time forth. Foreign exchange, which has fluctuated with the varying prospects—favorable and otherwise—of currency legislation, is fast declining to the gold importing point, which will in all probability be shortly reached. Advices from Europe intimate that large sums of money are there awaiting American investment so soon as something decided is done to put our currency on a settled basis. Banks in this country are loaded with money for which they are seeking profitable investment, and everything points to activity and returning prosperity just so soon as solid ground is offered to encourage a general revival of business. Hopes are now entertained that this condition is already developing.

The accumulation of surplus funds by the New York banks goes on at a rapid rate. Saturday's statement of the Clearing House banks showed an increase in the reserves last week of $8,744,000, bringing the surplus over legal requirements to more than $42,500,000, the highest ratio reached since September, 1885. As at that period, however, the immense surplus merely reflected stagnancy in business and absence of demand for money for speculative purposes. The great gain of funds during the past week was made, moreover, in spite of large shipments of money from New York to the South for the purpose of moving the cotton crop. The figures subjoined show the principal items of Saturday's statement as compared with the corresponding dates of 1892 and 1891:

	October 24, '91.	October 22, '92.	October 21, '93.
Loans.....	$405,602,400	$452,333,900	$394,037,700
Specie.....	82,210,100	70,649,300	95,718,500
Legal tenders.	34,281,200	46,904,400	52,344,000
Deposits..	416,400,600	460,885,100	421,686,900
Circulation.....	5,576,000	5,611,400	14,690,500

The following shows the relation between the total reserve and the total deposits at the respective dates:

Specie.....	$82,210,100	$70,649,300	$95,718,500
Legal tenders.	34,281,200	46,904,400	52,344,000
Reserve....	$116,491,300	$117,553,700	$148,062,500
Reserve required against deposits.	104,100,150	115,221,275	105,421,725
Surplus..	$12,391,150	$2,332,425	$42,640,775
Percentage.....	27.9	25.5	35.1

In respect to the movement of currency and gold to and from the interior by the New York banks, the *Financial Chronicle* gives the following tables, which demonstrate clearly the extraordinary gain that is going on in receipts over shipments:

Week ending October 20, 1893.	Received by N. Y. banks.	Shipped by N. Y. banks.	Net interior movement. Gain.
Currency.....	$8,498,000	$4,088,000	$4,410,000
Gold	2,047,000	411,000	1,636,000
Total gold and legal tenders..	$10,545,000	$4,499,000	$6,046,000

Result with Sub-Treasury operations:

Week ending October 20, 1893.	Into banks.	Out of banks.	Net change in bank holdings. Gain.
Banks' interior movement, as above.....	$10,545,000	$4,499,000	$6,046,000
Sub-Treasury operations..	18,600,000	15,500,000	3,100,000
Total gold and legal tenders..	$29,1450,00	$19,999,000	$9,146,000

New York Clearing House loan certificates outstanding have been reduced to less than $2,000,000. As a set off to the plethora of money in the banks the Treasury statement issued on Saturday showed that the gold reserve has decreased to $81,700,000 the lowest point it has ever reached. The loss for the first three weeks of the month of October reached $12,000,000. It is believed, however, that the reserve will from henceforth gradually climb up again, as the currency now in process of redemption will become unlocked and available for use.

The customs receipts at New York for the first 20 days of this month aggregated $5,038,000, as against $6,942,000 for the corresponding period of last year. A proportionate decrease in customs receipts at other points throughout the country is shown by the reports received. The falling off of the revenues is clearly shown in the official statement that since the beginning of the present fiscal year the expenditures of the Treasury have exceeded the receipts $22,000,000, which will be increased when October interest is taken out of the cash to the extent of $27,000,000 or $28,000,000. These figures bear out Secretary Carlisle's estimates that at the end of next June the deficit will amount to $50,000,000 or $60,000,000.

On the Stock Exchange a remarkable revival of trade has sprung up during the present week. Up to Saturday the volume of transactions was narrow, with a slight tendency to better prices, especially in the "grangers" and some of the less active railway stocks. On Monday a sensational rise took place in stocks of the anthracite coal roads, on the news of the acquisition of 40,000 shares of Lackawanna by W. K. Vanderbilt, with accompanying rumors of a coming change of ownership in that road, and a contemplated consolidation of the anthracite interests. Lackawanna, which closed on Saturday at 160, rushed up as high as 171½, or 4 points higher than it reached during the McLeod boom of last year. Jersey Central jumped 10 points, and Delaware and Hudson 5 points. This was followed, however, on Tuesday, by a sensible reaction. Meanwhile the absolute significance of the Vanderbilt purchase is not fully known, but the feeling exists that its outcome will tend to improvement in the general status of the road, and to harmonize conflicting interests in the anthracite coal roads. Another feature of recent business in the Stock Exchange has been an advance, with considerable activity and strength, in Reading stock, consequent on the extension of the Speyer loan, referred to last week. Monday's market, in consequence of these and other favorable causes, was more active and buoyant than for many weeks, nearly all railroads and industrial securities sharing in the general rise. American Sugar certificates were especially active, both on that day and on Tuesday, rising rapidly until 104½ was reached, the highest point yet touched by this stock, but dropping suddenly again to 99½. Late on Tuesday the news of the surrender of the anti-repealers at Washington and good prospects of prompt action in the Senate gave added buoyancy to the stock market, which closed strong, with values enhanced along nearly the whole list of stocks. The following list shows the extreme fluctuations of the more active securities during the past week, with closing quotations on October 25:

	Highest.	Lowest.	Closing, Oct. 25.
Am. Sugar Ref.....	104¾	91¼	103¾

Western Union.....	90⅜	81⅞	90¼

Money on call has ruled exceedingly low; rates having been quoted largely at 1 %. The usual rate has, however, been about 2 %, which was the closing price on Wednesday. The supply of call loans is abundant, but the demand hitherto has been but moderate. Time money is quoted at 4 % for 30 days, 4½ % for 60 @ 90 days, and 5 % @ 6 % for longer periods. Banks have not lately been in this market, such transactions as have been consummated being generally with trust companies or private lenders. Mercantile paper has shown some slight movement, and a fair out of town business is reported at about the following rates: 5¾ % @ 6 % for prime indorsed bills, 6½ % @ 7½ % for first class single names, 8 % @ 10 % for other names less well known.

Sterling exchange, has ruled weak and lower. The demand for remittances is slight, while the supply of bills is large. Last actual business was done at the following rates: Bankers' 60-day bills at $4.80¾ @ $4.82; demand at $4.83 @ $4.84; cables at $4.83¼ @

Hosted by Google

$4.84½; 60-day commercial, $4.79 ¾ @ $4.80; demand at $4.83½ @ $4.83¾. Domestic exchange on New York is quoted as follows: New Orleans, commercial 150 @ 175 discount, bank par; Charleston, buying ⅛ discount, selling par; San Francisco, sight 15; telegraph 25 premium; Savannah, buying ¼ discount, selling ⅛ discount @ par; Chicago, 75 premium.

The market for Government bonds is strong and practically higher. Closing quotations were as follows:

	Bid.	Asked.
2s, 1891, registered	97	.....
4s, registered	111	111¾
4s, coupon	111	111¾

Silver has strengthened; the closing price for bars in London being quoted at 33 15/16d. ℔ ounce, and in New York at 74¢ ℔ ounce.

New York.

Office of *The Iron Age*, 96-102 Reade street, NEW YORK, October 25, 1893.

Pig Iron.—Buyers are taking Iron only for immediate requirements, and the market continues very dull. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2; $12 25 @ $12 50 for Gray Forge, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft. Gray Forge is $11.25 @ $12.

Spiegeleisen and Ferromanganese.—There is only a very moderate demand for small lots of Ferromanganese. We quote: Foreign Spiegeleisen, nominally, for 10 % @ 12 %, $21.50 @ $22, and 20 % $25 50 @ $26, on cars, Jersey City, and Ferromanganese, $55 50 @ $56.

Billets and Rods. — Business in domestic Billets is very light. In Wire Rods a sale has been made of a moderate lot by a Western mill. We quote nominally: Domestic Billets, $20.50 @ $22.50, and foreign Billets, $28 @ $28.50, tidewater; domestic Wire Rods, $28.75 @ $29, and foreign Rods, $39.50 @ $40, tidewater.

Steel Rails.—Eastern mills report no new business. Rumors of a sharp cut are persistently circulated, but are without tangible foundation.

Track Material.—Small lots are selling at the following prices: Spikes, 1.80¢ @ 1.90¢; Fish Plates, 1.40¢ @ 1.60¢; Track Bolts, Square Nuts, 2.25¢ @ 2.40¢, and Hexagon Nuts, 2.40¢ @ 2.50¢, delivered. Concessions would be made for round lots.

Manufactured Iron and Steel.—A moderate sized order is about to be placed for a new city hall at Paterson. A prominent dry goods house in this city is also expected in the market soon for an extension. In engineering work a 1500-ton order is on the market for Buffalo. Plates are very dull, and some low quotations are being made. We quote nominally: Beams up to 15-inch, 1.75¢ @ 2¢; 20-inch, 2¢ @ 2.25¢, for round lots; Angles, 1.75¢ @ 1.90¢; Universal Mill Plates, 1.65¢ @ 1.90¢; Tees, 2¢ @ 2.15¢; Channels, 1.80¢ @ 2¢, on dock. Steel Plates are 1.60¢ @ 1.70¢ for Tank; 1.75¢ @ 1.90¢ for Shell; 2¢ @ 2.15¢ for Flange, and 2.50¢ @ 2.80¢ for Fire Box, on dock; Refined Bars are 1.50¢ @ 1.9¢, on dock, and Common, 1.40¢ @ 1.50¢; Soft Steel Bars are 1.50¢ @ 1.70¢; Scrap Axles are quotable at 1.70¢ @ 2¢, delivered; Steel Axles, 1.70¢ @ 1.90¢, and Links and Pins, 1.70¢ @ 1.80¢; Steel Hoops, 1.75¢ @ 1.90¢, delivered; Cotton Ties, 70¢ @ 72½¢ ℔ 45 lb bundle, at mill.

Old Material.—Steel Works Scrap is selling at very low figures, $10.50 @ $12. delivered, being done. Old Iron Rails are nominally at $13 @ $14; Old Steel Rails, $8 @ $9, and Wrought Scrap $9 @ $11.

British Iron and Metal Markets.

[*Special Cable Dispatch to The Iron Age.*]

LONDON, WEDNESDAY, October 25, 1893.

Business in Pig Tin has been confined chiefly to regular dealers. Reduction in Straits shipments fails to attract outside interest and consumers buy sparingly. The leading holders offer with some reserve, however, and prices vary in a moderate degree only, despite the dullness of trade. The average has been slightly higher than that of last week, with late transactions at £78. 10/ for prompt delivery and £79 for three months' futures.

Copper has ruled a fraction higher in the face of slow business and other adverse influences. The chief obstacle in the way of improvement is periodical selling orders from the American market. Orders from consumers have been readily filled at market value. Prices at the close were £42. 5/ for Merchant Bars, prompt delivery, £42. 12/6 for three months' futures, and £45. 10/ for Best Selected English.

Tin Plate orders have been moderate and the market is weaker, with some pressure to sell. Ordinary 14 x 20 Bessemer Cokes went at 10/9, f.o.b. Swansea, early in the week, but some orders were subsequently placed at 10/6. Demand for Oil sizes has moderated. Stocks at Swansea are estimated at 226,000 boxes. Liverpool quotations are as follows:

IC Charcoal, Alloway grade	12/9 @ 13/3
IC Bessemer Steel, Coke finish.	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12/
IC Coke, B. V. grade, 14 x 20	11/6 @ 11/9
Charcoal Terne, Dean grade	11/3 @ 11/6

Pig Lead has been very quiet, and prices have remained at £9. 12/6 for Soft Spanish.

Spelter has remained steady in price at £16. 15/ for ordinary Silesian, but found rather slow sale.

All branches of the Iron and Steel trade remain flat, with prices soft but showing no radical change. Last dealings in warrants were at 42/3 for Scotch, 34/6 @ 34/7½ for Cleveland, and 44/6 for Hematite.

From Pittsburgh comes the information that the vote of the lodges of the Amalgamated Association on the question of granting a reduction of 10 per cent. to the sheet manufacturers will not be concluded before the latter part of this week. In the meantime the members of the Association of Iron and Steel Sheet Manufacturers, believing that the vote will be against accepting the reduction, have arranged to hold a meeting in the *Times* Building, Pittsburgh, on Thursday, the 26th inst. At this meeting it is expected that important action on the request for a reduction will be taken. In case the workmen refuse to adjust the wage scale governing sheet mills adopted in Pittsburgh last summer to conform to the recent reduction in the base of the bar and guide mill scales from 2 cents to 1½ cents, it is not improbable that the sheet manufacturers, who have heretofore recognized the Amalgamated Association, will refuse to longer treat with that organization and will operate their mills with non-union workmen. Should this action become necessary it will be a very serious blow to the Amalgamated Association, as what little strength that organization retains lies nearly altogether with the sheet manufacturers. The final outcome of this matter is being awaited with considerable interest by the trades.

Industrial Matters in Ohio.

The actual condition of affairs is dull, and there are many thousand workmen throughout the State either idle or only working part time. Blast furnaces are out of blast, bar mills and guide mills are nearly all idle, boiler shops, machine shops, foundries and miscellaneous factories would not in the aggregate average half time. The holiday and stock taking season is approaching, and the vision of hard times will soon become a reality. There is only one branch of the iron and steel trade in which any activity is noticed. Sheet mills are able to continue operations, but in all other branches operations are nearly at a standstill, the cause being unremunerative prices and an incompatible wages scale. In spite of these facts, however, the sheet mill skilled workers have cast their votes through their various lodges, and have refused to agree to a reduction of 10 per cent. in their wages simply because the scale was signed for a year and they want their "pound of flesh." What the immediate result will be is difficult to predict, as the mills which are in operation are all working on orders for prompt shipment, and do not care to disappoint their best customers, but as soon as present wants are supplied the battle may begin in earnest. Orders now entered have been accepted only after the closest scrutiny in regard to the credit of the buyer, and there is no attempt to force goods. The bulk of business being done is in galvanized sheets, and mills that are able to make up mixed cars of black and galvanized are getting preference from the best buyers. The slight activity is not to be compared with the rush for material felt at this season for many years past, and when it is over the workmen will probably realize that they have made a mistake. It is safe to say that no stocks will be accumulated this winter at the mills, although such has been the course in former years. The ultimate result may be local agreements on a non-union basis, as indicated in *The Iron Age* two weeks ago, and nothing but a conciliatory spirit on the part of the workmen can prevent it. The manufacturers are independent in their attitude toward buyers for the reason that they are not over anxious to run their plants, and they are ready to act in the same manner toward the men when occasion requires.

The iron and steel roofing trade is particularly dull this fall, and the average time made by the 23 concerns doing business in the State is not more than three days per week. Traveling men are nearly all at home for the rest of the season.

HARDWARE.

Condition of Trade.

ORDERS continue comparatively small and cover in most cases assortments simply for the replenishing of stock, seasonable goods having also a prominent place. Anticipating a quiet trade for the next two or three months, the large wholesale houses are buying very sparingly, preferring to let their stocks become considerably depleted rather than be obliged to carry over a considerable quantity of goods. They are also giving continued attention to the matter of credits, and are exceedingly careful in this regard, and disposed to restrict the time which accounts are permitted to run, limiting the transactions largely to a cash basis. In order to dispose of the stock on hand there is also a tendency on the jobbers' part toward cut prices on a good many lines, and more or less irregularity is thus caused. Prices, however, are pretty well maintained, and while there are cases in which manufacturers would undoubtedly accept lower prices on attractive orders, there has been on the whole a remarkable steadiness in values. Collections are unquestionably better, but a good deal of complaint is still made on this score. There is no reason to doubt that business during the past month or two has been seriously injured by the delay in the repeal of the Sherman bill, but it is expected that early action in this direction will have a beneficial effect on the general condition of trade.

Chicago.

(*By Telegraph.*)

The Shelf Hardware trade is in about the same condition as reported last week. The volume of business shows a decided falling off from its condition during the first half of October. Merchants throughout the Northwest have evidently filled up on season goods, and orders now coming in are only for small lots of Hardware, merely to cover present requirements. Stocks are reported by salesmen to be extremely light in every direction, but merchants are still disinclined to buy anything more than they must get for their immediate trade. The outlook is quite discouraging for the jobbing trade here for the balance of the year. Economies are being instituted so as to reduce expenses as much as possible to correspond with the shrinkage in business. The prices on Hardware generally are remarkably steady considering the circumstances. Tin and Tinware are especially noticeable in this respect, which is perhaps due to everybody carrying very light stocks. Heavy Hardware is in a somewhat better condition than Shelf Hardware, owing to the continued good trade in the iron and steel departments. The other departments, however, are quiet, as wagon and carriage makers are still buying very lightly.

St. Louis.

(*By Telegraph.*)

There is no particular change in the Hardware trade since our last report, except, perhaps, that prices are not as firmly held. Here and there low prices for special lots are made, which rapidly become regular selling prices, and a lower range all around is the natural result. Wire Nails just now seem to be the special victim, and we hear of some exceptionally low prices, which if even thought of three months ago would have appeared more than ridiculous. Jobbers and retail dealers alike are not carrying anything like their usual stock or assortment, and refuse to change this policy until something definite is done in Washington. A waiting policy is being adopted, and under the circumstances seems the only correct one to adopt.

Notes on Prices.

Wire Nails.—The volume of business is rather light, and comparatively few of the mills are running on full time. There have been some inquiries in regard to quotations on especially large lots, and it is understood that low figures have thus been developed. The market on the whole is represented by $1.30 for carload lots at mill, this figure being readily obtainable, though some manufacturers quote a slightly higher price.

Chicago, by Telegraph.—The trade in Wire Nails tapered off during the past week, the early part having been fairly active, but it has as yet not relapsed into complete stagnation, as there are some inquiries from large buyers for considerable quantities which are expected to lead to further business. Prices have receded on factory lots and some sales were made as low as $1.32½, Chicago, although $1.35 to $1.40 are now considered fair quotations. Jobbers have recently had an improved business in Wire Nails and have taken a great many orders, but usually for small quantities. Their regular price from stock is $1.50, but this is shaded by some houses.

Cut Nails.—There has been little change in the Cut Nail market since our last review. The quotation of $1 base is regularly and quite firmly adhered to. There is evidence of a disposition on the part of the mills to obtain a slight advance, but it is not attended with much success. The volume of business is not sufficient to justify the running of the mills to their full capacity, and at the present time considerably less than the usual quantity of Nails are being made in the Wheeling district, and the Eastern mills seem to be doing a somewhat larger proportion of the business than usual. The New York price for small lots from store is $1.20 to $1.30.

Chicago, by Telegraph.— The trade in Cut Steel Nails has been for some time moving in spurts, being fairly active for a few days and followed by a period of dullness. The net result, however, is such as to keep the local factories steadily at work. A change has recently been noted in the character of this trade which seems to have some significance. A great deal more business is now being done in Finishing, Casing and Clinch Nails, which was a branch of the trade that for a considerable period seemed to have been completely monopolized by Wire Nails. The Cut Nail manufacturers are hoping that this may prove that a reaction has taken place, but would like to see some further demonstrations before allowing themselves to derive very much encouragement. Prices are maintained at $1.20 to $1.25, Chicago, for factory lots. Small lots from stock are held at $1.30.

Barb Wire.—The Barb Wire market is stagnant and in an unsettled condition. Prices are decidedly in buyers' favor, and with the small volume of business doing are uneven and irregular. We quote Galvanized Four-Point at mill on a basis of $2.25 to $2.30. Painted being held at 40 cents less, but concessions from these figures are obtainable.

Chicago, by Telegraph. —Manufacturers report only a moderate trade. This is derived in a large measure from direct connection with the retail merchants. It is difficult to obtain quotations as trade is now going, as prices made depend entirely on circumstances.

Hosted by Google

Manufacturers of ordinary Galvanized Barb Wire are selling at $2.40, but this is shaded. Jobbers continue to quote small lots from stock at $2.55, but say that their trade in this line is practically dead.

Clippers.—We are advised by the Coates Clipper Mfg. Company, Worcester, Mass., that only 20 per cent. discount is allowed on their power machines and parts for the same, instead of 25 per cent. discount, as stated in our issue of October 19, 1893, under Notes on Prices. With the exception of power machines and parts their line of Clippers is subject to a discount of 25 per cent.

Combined Door Lock and Ventilator.—This article was described in our last issue as put on the market by the Brooklyn Specialty Company, 166 Pierrepont street, Brooklyn, N. Y. It is sold to the trade, japanned, at $3 per dozen, net, and nickel plated at $5 per dozen, net.

Magnetic Curry Comb.—The Ives Mfg. Company, North Granville, N. Y., who are manufacturing this article, which was illustrated in *The Iron Age* October 12, are selling the Comb to the retail trade at $2 per dozen, net.

Cream City Flour Bin and Sifter.—This article is put on the market by the Geuder & Paeschke Mfg. Company, Milwaukee, Wis., and was described in a recent issue. It is sold from the following list, which is subject to a discount of 50 per cent. to the trade:

25	50	100 pounds.
$34.00	$42.00	$54.00 per doz.

Automatic Steam Coffee Cooker.—This Cooker was described in our last issue and is put on the market by Wilmot Castle & Co., Rochester, N. Y. It is sold to the trade from the following list, which is subject to a discount of 40 per cent.:

2-qt. heavy tin,	$1.50	...nickeled pots,	$2.00
3 " " "	1.75	... " " "	2 50
5 " " "	2 50	... " " "	3.50

Cereal Kettles for use in connection with the above steamers are sold at 20, 25 and 30 cents respectively.

The Arnold Automatic Steam Cooker, put on the market by the same concern, is sold to the trade from the following list, which is subject also to a discount of 40 per cent.:

No. 0, Two quarts,	1	compartment,	$1.50
No. 1, One gallon,	1	"	2.25
No. 2, Two gallons,	2	compartments,	2.75
No. 3, Three gallons,	2	"	3.50
No. 3, Three gallons,	3	"	3.75
No. 4, Four gallons,	3	"	4.50
No. 5, Five gallons,	3	"	5.00
No. 5, Five " oval,	3	"	6.00

Glass.—Since our last report the Glass market has been declared an open one by the National Window Glass Company; that is, the agreement among American manufacturers to sell Glass at only fixed prices has been abandoned. The Glass factories will start up when and as they please, so it will be a free fight and no favor. The National Window Glass Company did not give up their charter, but for the present will not influence the manufacturers nor the trade. The wage question has not yet been definitely settled, but indications are that an agreement will be reached in a short time. It is estimated that 75 per cent. of the factories will be started up in the near future, but it remains to be seen how large a proportion of those starting can continue running, with light demand, accumulating stocks and low prices. Former quotations are still being adhered to, as no new Glass can be got on the market under three or four weeks, by which time the fall demand will practically be over. In Plate Glass there is little doing. Imported Glass is being sold in a small way, as the market continues lifeless.

Export Notes.

PAUL F. GERHARD & CO., 19 Whitehall street, freight agents of the Lamport & Holt line of steamers to Rio de Janeiro, recently inaugurated, have issued a special notice, announcing to shippers that owing to the increased expense in landing cargo in Brazil, by reason of the present disturbed state of the country, they have been obliged to advance all rates of freight 20 per cent. to Rio de Janeiro.

Roland R. Dennis, in charge of Whitman & Barnes Mfg. Company's London branch, has returned to England after a three weeks' visit here. He came over to attend a managers' meeting, which was held at Akron, Ohio, September 18, at which all the branch houses were represented.

The Central & South American Telegraph Company, 37 Wall street, New York, have issued a handsome mounted wall map, 39 x 37 inches in size, for the accommodation of their patrons, which shows at a glance not only the location of their own cables, but those of other companies connecting North and South America, as well as the numerous submarine lines to Europe. Commencing at Galveston, the various points reached by them in Mexico, Central America and the West Coast ports of South America, together with their transcontinental line from Valparaiso to Buenos Ayres, are given, in connection with the land lines of both continents. These features are represented on a hemisphere 30 inches in diameter, resting on a blue background.

Drawer Labels.

THE TABLET & TICKET COMPANY, 99 Franklin street, New York, and 87-89 Franklin street, Chicago, who make a specialty of Wilson's Gummed Letters and Figures, are offering a line of Drawer Labels, one style of which is represented in the accompanying cut. Other labels are shown, with variously designed back grounds and different sizes of letters, and reading as follows: "Yale, Small Brass;" "Brass Screws, One Inch;" "No. 6 Door Hinges," and "Spring Locks." Desk and cabinet cards for document boxes are also shown, made in the same manner. These are all made with their Wilson white paper letters on black gummed paper, which can be easily moistened and attached to a drawer or box. Labels are made with any wording desired, at 50 cents per dozen labels. A recently issued catalogue of merchants' specialties, shows these labels; also a large variety of tickets, tags, labels, &c.

Drawer Label.

World's Fair Exhibits.

ATLAS TACK CORPORATION.

The arrangement of Tacks, Nails, Eyelets, Rivets, Staples, &c., by the Atlas Tack Corporation, Boston, makes an attractive and effective display. A large canvas is mounted on a richly carved frame which stands on a raised inclosed platform. On the canvas is painted one of the mills of the A. Field & Sons branch of the corporation, with a title scroll and list of specialties; also the addresses of the various corporation branches. On the reverse side of the canvas panel is an eagle surrounded by the stars and accompanied by the shield and flag; while beneath is the title of A. Field & Sons, with the description of the specialties produced at their works, all done in letters formed by copper and iron Tacks, carpet, brush and gimp Tacks, patent coated Tacks, &c., the color effects being created by the use of the various colored Tacks. The panel represents, it is stated, the six months' continuous work of one person. Surrounding the panel are uniform showcases containing a series of trays divided into compartments in which are displayed the many colored Tacks, &c It is remarked that the exhibit includes over 2000 sizes of carpet, upholstery, leather and silk covered Tacks, brass Nails and Buttons, Staples, double pointed Tacks, Eyelets and Rivets, Brads, Nails, Escutcheon Pins, Tufting Buttons, Tufting Nails, &c., the Tacks measuring from $\frac{1}{16}$ inch up through and including all the standard sizes.

NATIONAL CASH REGISTER COMPANY.

The National Cash Register Company, Dayton, Ohio, have three exhibits at the fair—one upstairs in the Department of Liberal Arts, another in the Electrical Building and a third in Machinery Hall. The exhibit in the Electrical Building is in a pavilion, at the left of which is a Total Adding Register, having on the top a number of metal signs, two of them being exhibited at a time, and automatically changing about every half minute. Two of the keys of the register are operated to show the public how the registers work. The interior mechanism of the machine is exposed, showing the method of adding. On the other side is a gold plated check printing register, which is also worked automatically. At short intervals the register prints, cuts off and throws a check out, on which is printing, showing the amount of the purchase, the date, the number of the check, &c. The register has an illumi-

Hosted by Google

nated sign on top which flashes out at frequent intervals. In the center of the pavilion is a glass picture, illuminated with a light at the back, showing a view of the envelope addressing department at the factory, with operators at work. On the opposite side of the pavilion is another illuminated picture in colors of their factory at Dayton, showing a scene at night with all the windows lit up. Employees of the company are in attendance to explain the merits of the registers. At the Machinery Hall exhibit registers are displayed on counters in a booth finished in cream and gold. Attendants are here kept busy explaining the workings of the machines, and at all the exhibits the public is invited to touch and operate the registers. In addition to the exhibits there are over 650 National Cash Registers used by the World's Fair, the collection department having adopted them to control and account for the cash received. These are found on the Midway Plaisance, in the German village, Esquimaux village and elsewhere. We are advised that foreigners soon learned to operate the registers.

Changing a Credit into a Cash Business.

BY E. D. WARNER.

THAT A BUSINESS upon strictly a cash basis is preferable to one part cash and part credit, or to one all credit, is conceded by all progressive merchants. But while the theory and desirability are granted, the practicability is doubted—in fact, even derided. To a merchant starting a new business, to open and continue an all-cash trade, is comparatively a simple matter; the rub comes upon changing a credit into a cash business.

CAN IT BE DONE

without injury to my business? Most emphatically yes, if one has push, patience and perseverance, but if one be weak and vacillating, then a negative answer must be given. While the beginning may be marked by a decrease in the amount of sales, yet the net profits will usually be found to be as great, if not greater, than before; for in a part cash and part credit business three-fourths of the profits will result from the cash part. A large share of the items of expense, if examined carefully, will be found to consist of matters relating largely to the credit side of the ledger, such as bad debts, bookkeeper, cost of collection, extra help required, interest on capital invested and a number of other charges traceable to the same cause. In a cash business these are eliminated, while as added sources of profit we have cash discounts, increased custom because of lower prices, quick returns upon compound interest of money invested and the freedom from that peace destroyer, worry. Besides, one has his business well in hand, is ever pushing it, and with a gilt-edge credit—the best of capital.

LESSENED SALES.

Without doubt the first year or two will see lessened sales, but remember it is but the shrinkage from inflation to real value and that the growth afterward will be more healthy and satisfactory than it ever otherwise could be.

The end is desirable, but how is it to be obtained?

In the first place, decide to change to a cash basis and do it. Do as Cortez did when entering Mexico with but a handful of men against a rich and powerful nation — burn your boats behind you and press on with a firm determination to succeed, and you will. Set a day for the change, and prepare your customers for it by explaining to them as far as possible, either personally or by letter when well acquainted, by circular, as we did, or through the press, the advantages to be derived therefrom by yourself, but especially by them.

When we decided to make the change to a cash basis we issued a circular, which was distributed among our customers, as follows:

We take pleasure in announcing to our friends and the public generally that after this date we propose to conduct our business, both buying and selling, on the cash plan.

A long experience in the Hardware business has convinced us that the system of selling goods on credit, to be paid for when convenient, is a most vicious one. The increased expenses of doing a credit business, on account of salaries of bookkeeper and collector, the amount of inevitable losses every year because of bad debts, which will occur notwithstanding the most careful discrimination, and the loss of interest from having a large amount of capital "tied up" in book accounts, all render necessary a larger margin of profit, which has to be considered as business expenses and paid for by the cash buyers.

Besides this, the bad feeling constantly occurring because credit is given to one customer and refused another, and the disagreeable necessity of being obliged to "dun" customers for past due accounts, confirm us in our determination in the future to sell for cash.

In these times of close competition cash buyers expect, and are entitled to, the very lowest prices, and should not be required to pay the losses incident to a credit business.

In the future it shall be our aim, by giving the most careful personal attention to every detail of our business, to satisfy the demands of close cash buyers, and to carry a still better assortment of carefully selected lines of the following goods. Endeavoring in all things to further the interest of our patrons by giving them all the advantages of a cash system, we shall hope to merit a continuance of the patronage which we have received in the past.

On the other side of the circular we called attention to the fact that we carry in stock a large and complete assortment of the following goods, purchased direct from the manufacturers for cash. The various lines of goods were mentioned under the following headings:

BUILDERS' HARDWARE.
CUTLERY.
MECHANICS' TOOLS.
BUTCHERS' SUPPLIES.
BLACKSMITHS' GOODS.
FARMING IMPLEMENTS.
HOUSE-FURNISHING GOODS.
MANUFACTURERS' SUPPLIES.

Show by your prices how much cheaper you can sell now than before, as you surely can. It is unnecessary to make a pro rata reduction through your stock, but make leaders many and often, display tastefully, advertise extensively and trade will be attracted. This now can be done with no fear of loss. Upon those articles where competition is severe figure very low, for here comparisons will be made; but from those unattacked a good profit can be reaped. In the first case, however, good returns will be obtained because the stock is quickly turned into money and reinvested, the interest or profit being now compound instead of simple.

FOR CASH.

One, except in special cases, can always sell for cash closer than for credit, and in this way is able to make greater inducements to the public to trade with him than can his credit competitor. Without doubt a few customers will become offended when refused trust, but for every one thus lost two will be gained, and as the firms see that their money will go further for cash than when time is given they will soon return. A man if he thinks he has saved money upon an article of good quality will be pleased. Such a customer is the best advertisement one can have. Sell close at a fixed price, back it up by strict honesty and courtesy, and there will be no doubt of your success.

IN CHANGING

to a cash basis, to get the best results most quickly, circumstances will alter cases. With a wide fund to draw from the change can be made at once, but when restricted it is often better to allow, for convenience, a little time to those you know will pay your bill as soon as presented. They will, however, soon become educated to paying cash. But let the time given be brief as possible.

Our experience of a year in a cash business has confirmed our theory. While the amount of sales has of necessity diminished, we are constantly, by reason of reduced expenses, lower prices, &c., extending our business to fields into which we could not otherwise have gone. Moreover, while selling on much closer margins than before the change was possible, the ratio of profits to sales is greater. But best of all, when we leave at night "we go not like the galley slave, scourged to his dungeon," by worry over approaching bills, but "sustained and soothed by an unfaltering trust—we lie down to pleasant dreams."

THE SUDDEN DEATH of Charles W. Cotchett, who represented the Peck, Stow & Wilcox Company to the trade of this city and vicinity, occurred October 18, and is appropriately announced by the company. They speak of him as a young man of sterling intergrity, faithful to their interests, beloved by his associates and popular with their customers. The funeral services, October 20, from his late residence, were attended by the New York managers and employees in a body, the store having been closed for that purpose.

William T. Nicholson.

THE TRADE have learned with regret of the death of William T. Nicholson, founder and president of the Nicholson File Company, Providence, R. I., announcement in regard to which appeared in our last issue. Mr. Nicholson's portrait is given herewith, and below is a sketch of his eventful career:

William T. Nicholson was born in Pawtucket, R. I., March 22, 1834, and died on the morning of the 17th inst., having been stricken with apoplexy after rising from the breakfast table the previous day. He was thus in his sixtieth year at the time of his death. His funeral was held from his residence, on Friday, at 12 o'clock noon, and was attended by a large assemblage of sympathizing friends in business and social circles. His boyhood and school days were spent at Whitinsville, Mass., and it was there at the age of 14 that he entered the machine shop of Paul Whitin & Sons, where he remained three years and learned the machinists' trade, which was the basis of his life work. Soon after that time he came to Providence as furnishing a better field for a wider and more varied experience. After a short time spent with Halsey Hatley, one of the pioneers in the manufacture of machinery for making Screws, and subsequently with the firm of Arnold & Barber, he found employment with Joseph R. Brown, with whom and the firm of Brown & Sharpe he remained for six years, having been the foreman of their shops during the last two years of his service with them. By diligent use of his evenings, which he had devoted to the study of mechanics and mechanical drawing, he had acquired such proficency that he was competent to make all the drawings used in the works where he was employed. In 1858 he entered into partnership with Isaac Brownell in the manufacture of jewelers' tables and light machinery, but bought out the interest of his partner in 1859, and in 1860 moved into larger quarters, materially increasing the productive capacity of his plant.

The outbreak of the Civil War, though at first followed by dull times, soon brought into active play the plant and the resources of Mr. Nicholson to supply the machinery needed to produce the small arms required by the United States Government. Soon after he engaged in the manufacture of parts of the Springfield rifle, having devised special machinery and formed a partnership with the late Henry A. Monroe for that purpose, in addition to carrying on his machine shop. In the spring of 1864 he sold this branch of the business to his partner, Mr. Monroe. This left him free to give more attention to his machine shop, and especially to the development of an invention which he had for some time previous desired to perfect—a machine for cutting files. The successful completion of this machine soon followed, and the organization of the Nicholson File Company in 1864 was the result. Had Mr. Nicholson realized the long and tedious road which lay before him ere success would crown his efforts it is doubtful if he would have had the courage to attempt the task of building up an industry in File making by machinery. There were many times between the inception of the project and its final assured success

WILLIAM T. NICHOLSON.

when even his confidence and his devotion to his pet hobby came very near deserting him, and only his tenacity of purpose saved him from defeat and failure. For it should be borne in mind that his success with the machine for cutting Files made it necessary that machinery should be devised for the other operations of forging, annealing, grinding and hardening if a successful business were to be carried on. This was ultimately accomplished, and the making of machine cut Files was an unequivocal success.

But now Mr. Nicholson was brought face to face with another difficult task—that is, the selling of his goods. For years the English hand cut File had monopolized the American market, and to dislodge it from its position was the work now before him. The conflict was long and fierce, but triumph was finally his, and the noble monument to that success is found in the plant which has been erected as the result of his efforts, and which is without a rival in completeness and capacity.

There is one thing that stands out in Mr. Nicholson's connection with his company, and it stands out so clearly and distinctly as to be almost unique, and that is, that in devotion of time, of energy, of talent and of care he gave as fully and freely as it would have been possible for him to have done had the property and interest been wholly his instead of a corporation's. In these days when trusts seem to be borne so lightly, such an example of devotion to the interests of others is worthy of being held up to public attention and emulation.

The Nicholson File Company were thus the pioneers in successfully producing machine cut Files. Previous to the incorporation of the company in 1864 goods of this character were made in Boston by the Whipple File Company, a concern having a large capital, which was eventually sunk in an endeavor to produce Files by machinery. Before them were the concerns of Ibbotson & Horner and James Horner & Co., who were located at Sing Sing, N. Y. The Nicholson File Company were also the first to pack their goods in telescope boxes, superseding the unsightly and inconvenient paper packages, which is mentioned as an indication of the pains taking care and attention given to all the details of the business in connection with the splendid enterprise which always characterized it under Mr. Nicholson's management.

Mr. Nicholson has served the city of Providence as an alderman from his ward; has been a trustee of the Providence Public Library from its organization and was for several years its treasurer; was a director of the Rhode Island National Bank and the Narragansett Electric Light Company; a member of the Providence Board of Trade and of the American Society of Mechanical Engineers. In 1857 he married Elizabeth Dexter Gardner, daughter of Samuel and Alice (Mowry) Gardner, who survives him. They have had five children, Stephen, who for several years was superintendent of the File Works and who is at present connected with the company; Samuel Mowry, who in 1881 was elected secretary, and for the past two years has held the positions of vice-president and secretary; Col. William Thomas, Jr., deceased, who in his short career as a banker had earned the esteem of all who knew him; Eva, wife of Stephen Waterman, and Elizabeth, now completing her education.

Hosted by Google

The lapse of time with success achieved brought no change in the labors of Mr. Nicholson, and the closing week of his life found him actively and earnestly working for the success of the corporation which he has so conspicuously served. His death has served to develop and bring into prominence many emphatic expressions of esteem from persons in the trade who by many years of contact with Mr. Nicholson are recognized as qualified to judge. These expressions evidence the high regard in which he was held personally and as a business man. Reserved in making pledges, he was sure to redeem any guarantee thus given. Buyers with whom he had relations felt free to anticipate their wants, knowing by experience that any inequalities which might arise in a season's trade would be cheerfully adjusted on a satisfactory basis without dispute or controversy. Genial and affable, he was always cordially welcomed by those who had the pleasure of knowing him, who eagerly sought for his views on the prominent questions of the time, in regard to which he was especially well posted. He was permitted to attain to a success which is within the reach of comparatively few, and his career marks an epoch in the manufacturing methods of the line with which his activity was identified. It is pleasant to record how well deserved was the ample measure of success that he achieved, based as it was upon industry, preserverance, enterprise, ability and character. He will long be remembered by the trade as capable, thorough, painstaking and absolutely trustworthy, a man of sterling integrity, exceptional sagacity and unquestioned worth.

Trade Items.

THE TRADE will observe the advertisement of C. J. Healy, 106 Chambers street, New York, referring to Keyes' patent Pliers and Nippers, on which it is intimated that a Hardwareman can make 100 per cent. profit. The fact that they are handled quite generally by jobbers of Hardware is also alluded to.

F. E. KOHLER & Co., Canton, Ohio, have taken the agency for the Champion Lawn Rake (all iron), which is manufactured by the Champion Lawn Rake Company of Canton, and are prepared to fill orders for these goods.

THOMAS C. HOAGLAND, who has for a number of years been connected with the H. B. Newhall Company, has opened an office at 85 Chambers street and 67 Reade street, New York, as direct representative of the following manufacturers: T. Rowland's Sons, Shovels, Spades and Scoops; Milton Mfg. Company, Wrought Iron Plate Washers, Hot Pressed Nuts, Machine Bolts, &c.; Carlisle Chain Works, Trace, Stake and other Bright Chain, and Coil and Cable Chains; Bedford Handle & Hard Wood Company, Axe, Pick, Sledge and other Handles; F. Gardner & Sons, Carriage and Wagon Axles. Mr. Hoagland has also made arrangements with Wiebusch & Hilger to represent them on special lines in the New England States. For his success in this new departure Mr. Hoagland will have the best wishes of his many friends.

A FIRE BROKE OUT about 11 o'clock in the forenoon of October 24 on the premises 58 Warren street, New York. The street floor was occupied by the Excelsior Hardware Company, while the basement and sub-basement contained the stock of E. J. Brady, plumber. The fire started in the rear of the floor below the street; cause at present unknown. A rough estimate places the damage at $4000 to $5000, a large part of which is water damage. Both businesses were practically one interest. Insurance up to 80 per cent. was carried on the stocks, which, it is hoped, will cover the loss.

WE ARE ADVISED by S. H. Smith of Oxford, N. C., that he is carrying on the business formerly conducted by Owen, Barbour & Smith in that place, having succeeded them some months ago.

Practical Hints for Hardwaremen.

BY A. F. G.

THE AMOUNT of money to be used for family or

PERSONAL EXPENSES

should be decided upon at the beginning of each year, the amount based upon the net profits yielded by the business the year previous. The merchant should then treat himself as a clerk, paying himself a monthly or weekly salary, in accordance with the amount decided upon. It is poor policy and unbusiness-like—in fact, it is not treating the business fairly—for the merchant to give himself the run of the money drawer, and to take from it without charging himself with the amount taken. Nor is it wise to put into one's pocket cash received without accounting for it. Goods taken from the store by the proprietor should be paid for at cost from his salary if the salary plan is followed; if not, they should be charged to his account. The keeping of open accounts on the ledger, no credits being shown, with the doctor,

GROCER, BLACKSMITH, ETC.,

with whom the merchant has dealings, is to be condemned. The apparent money owed by these parties, as shown by the account, only deceives the merchant. If it is desirable for any reason to keep running accounts with such parties, the merchant should insist upon receiving their bills each month and credit them with the amounts.

IN MARKING GOODS

to yield an average per cent. profit, some goods will have to bear a greater and some a less profit than the average; while those marked at less than the average will be the ones most largely sold. It is not always safe to mark goods at the same price as a competitor is selling them for, without being satisfied what percentage of profit such prices would yield. He may be selling them at a higher price than a legitimate profit warrants, or his price may be lower than their cost to you would justify. In the latter case he may have better facilities for buying them, or he may be selling them at a loss. The matter should be carefully examined into, to ascertain whether the goods can be bought to sell at his price, or whether he is really losing money on them. If a legitimate profit cannot be made on any class of goods, after exhausting all resources in purchasing, it is better to drop them until a profit can be made.

The advantage of doing an

ALL-CASH BUSINESS

over that of doing part cash and part credit is great. A merchant often thinks he is obliged to do business on the latter basis, when, in the course of a year, he could by easy stages, convert his customers to an all-cash system. Some who have studied the matter carefully consider that when goods are sold at the same prices to cash and credit customers, the credit part of the business yields no profit, taking into account the loss of interest on the amount credited and the amount lost by bad debts.

The experience of a firm who have recently started a strictly cash Hardware business is that they could sell a much larger quantity of goods on a credit basis, but that they sell a great many goods to people simply because they do not owe the new firm.

If, however, a credit business is done, a specified date should be agreed upon when the goods are to be paid for—a bill rendered promptly, with the expectation of its being promptly paid. Some merchants make it a rule that all goods sold on credit, on which no specified time is given, must be paid for by the end of the current month.

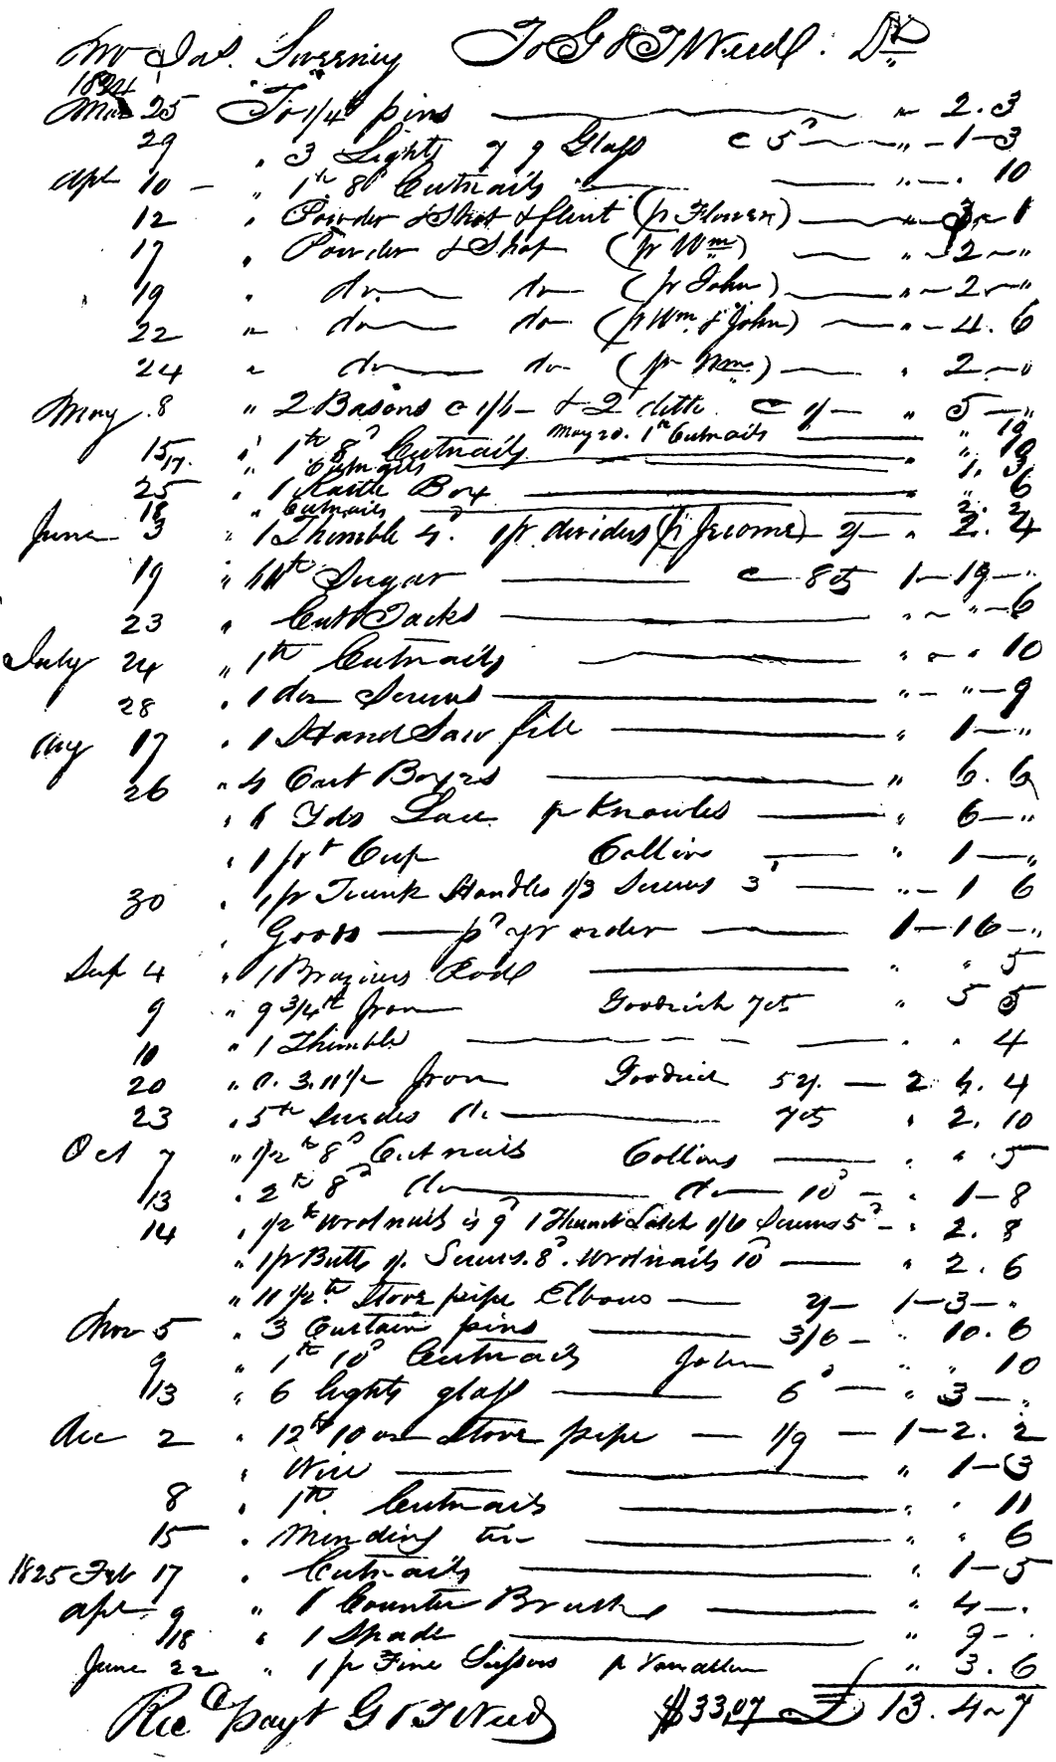
CASH AND CREDIT.

The amount of credit to be given in proportion to the cash business done should be decided upon at the beginning of the year, and the proportion strictly adhered to. Prudence would suggest one-quarter credit to three-quarters cash sales. By keeping a daily account of cash and credit sales, the average can be maintained.

The advantages of having the

OFFICE NEAR THE FRONT

entrance of the store cannot be overestimated. Here customers can be welcomed as they enter; clerks called to wait upon them, or waited upon by the proprietor if all the clerks are busy. Books and correspondence can here be attended to in comfort when not otherwise engaged, knowing prompt attention can be given to other matters when required. If books, correspondence and the store cannot all be properly attended to,



AN ASSISTANT

in the office is a good money investment, and may save the merchant from utter failure in business.

An Old Bill of Hardware.

THE ACCOMPANYING ILLUSTRATION is a reproduction of an old Hardware invoice, which was brought out as one of the mementoes connected with the recent celebration of the seventy-fifth anniversary of Weed & Co., Buffalo, N. Y. It dates, it will be observed, from 1825. The goods were sold by G. & T. Weed to James Sweeney, father of a present resident of Buffalo, by whom the bill was given to Weed & Co., who have had it appropriately framed, and have given it a conspicuous place in their office. The bill is of interest to Hardwaremen as illustrating the line of goods handled at that comparatively early date and the prices which were then prevailing, which may, perhaps, excite a feeling akin to envy in the minds of merchants whose margins of profit on similar goods are at the present time unsatisfactorily narrow.

Bill of Hardware 1825.

Price-Lists, Circulars, &c.

CLEVELAND AXLE MFG. CO., Canton, Ohio: Arrow Brand of Wagon and Carriage Axles. An illustrated catalogue shows a view of their new factory, also of Concord Express Axles, sand grooved; Square Shank Axles, one piece coach bed, fantail bed, coach bed; extra finish Steel Axles, half patent and taper; Long Swell Double Collar Axles, Half Collinge Axle, Self Lubricating Axles, &c. The company state that with their improved facilities they can safely promise prompt shipment of all orders received. A separate book is devoted to testimonials of their No. 6½ Concord Express Axles.

HOLLANDS MFG. COMPANY, Erie, Pa.: Chucks, Vises, Pipe Wrenches, Stocks, Dies, &c. The company issue an attractive folder, telling in verse of the Brownies in Erie. An illustration is given of their Offset Jaw Vise, surrounded by these inquisitive folk.

E. T. BARNUM, Detroit, Mich.: Wire and Iron good. Catalogue No. 570, 120 pages, is accompanied by a discount sheet and illustrates with prices and descriptions a very comprehensive line of goods. It is remarked in an introduction that the book has been compiled with the view of showing a general line of the Wire and Iron goods manufactured, and while very complete, it embraces a class of goods covering so large a field that it is possible to illustrate but a comparatively few designs of the different lines.

C. M. MCCLUNG & Co., Knoxville, Tenn.: Hardware, Stoves and Tinware. Their Stove catalogue No. 4 illustrates, with prices, Ranges, Cook Stoves, Heating Stoves, Laundry, Parlor Lamp Stove, Grates, Hollow Ware, Stove Trimmings, Fire Sets, Stove Boards, Coal Vases, Iron Roofing, Freezers, Coolers, Wooden Ware, Galvanized Iron Ware, Tinware, Japanned Ware, Agate Ware, Cane Mills, Evaporators, &c.

CLAYTON BROS., Bristol, Conn., and 122 Chambers street, New York: Steel Laid and Cast Iron Shears, Hardware specialties, Leather Axle Washers, &c. Their catalogue illustrates, with list prices, straight and bent Trimmers, Bankers' or Paper Shears, Barber Shears, Buttonhole, Ladies' and Pocket Scissors, all in a variety of finishes; also Kitchen Knives, Screw Drivers and Solid Sole Leather Axle Washers. A full stock of these goods is carried at the New York office, where all communications should be addressed.

S. L. ALLEN & Co., 1107 Market street, Philadelphia: Flexible Flyers, Flyer Sleighs and Flyer Coasters. Catalogues illustrate and describe these goods, and give reasons why they are superior to others. The Flexible Flyers have light runners of T shaped spring steel, making them strong vertically, but flexible sideways. This enables them to be guided by putting the feet on a steering bar, avoiding dragging the feet in steering and economizing in shoe leather.

THE NORWICH LOCK MFG. COMPANY, Roanoke, Va.: Mortise Locks. An illustrative, descriptive catalogue shows Mortise Locks complete in sets, selected from a large variety of the goods manufactured by the company. The catalogue is of the miniature type, and a large proportion of the Locks are represented by one-third size cuts. The Locks shown include Egyptian bronzed iron and bronze sets for inside doors, iron and bronze sliding door sets, front door sets with brass fronts and in bronze, iron and bronze store door sets. List prices are given on a separate sheet accompanying the catalogue.

THE SEDGWICK BROS COMPANY, Richmond, Ind.: Wire Netting, Fences and Gates, Sedgwick's Wire Stretcher, Summer Houses, Lawn Furniture, &c. Their catalogue contains illustrations, descriptions and prices of Stretcher, Farm Fencing, Lawn Fencing, Pickets, Gates, Netting, Self Opening Gate, Fencing for cemetery lots, &c.

LEGGETT & BROTHER, New York: Questions Answered, and Hints on Home Decoration, an illustrated pamphlet devoted to descriptions of and an explanation of the manner of using the firm's Varnish Stains, Enamels, Floor Paints, Gold Paint, Bath Enamel, Glass Paints, Varnishes, Liquid White Glue, Liquid Polish and Furniture Polish. The pamphlet contains no prices, and is designed to go into the hands of consumers.

It Is Reported—

That the Hardware store of Gideon Winans, Meshoppen, Wyoming County, Pa., was burned out on the 10th inst.

That the Hardware establishment of Hormell & Henry, Waynetown, Ind., was destroyed by fire on the 11th inst.

That early on the morning of the 12th inst. burglars broke into the Hardware store of Miller & Wise, Alliance, Ohio, and stole $200 worth of Revolvers, Razors and Knives.

That William Wagner's Hardware store, at Monaca, Pa., was damaged by fire on the 9th inst. The loss was $3000; insurance, $2500.

That recently burglars broke into the Hardware store of C. E. Dunham, Bound Brook, N. J., and got away with about $450 worth of Guns and Revolvers.

That Mr. Gridley of the Hardware firm of Pond, Gridley & Co., Springfield, Vt., has disposed of his interest in the business.

That the Hardware business of W. W. Harrington, North Branch, Mich., is now carried on under the style of Harrington & Weston.

That J. M. Graham & Co., are a new Hardware and Stove firm at Walurba, Pa.

That new Hardware stores have recently been opened at Perry, Oklahoma, by Spencer Hardware Company, Coulter & Brown, Wm. Flagg and H. C. Wallerstedt & Co.

That Howland & Rothfus are successors of Rothfus & Co. in the Hardware business at Blissfield, Mich.

That W. B. Adams has sold his Hardware business at Cannonsville, N. Y., to Charles Jester.

That J. S. White is now carrying on alone the Hardware business formerly conducted by White & Bromley, Sedalia, Mo.

That the Hardware establishment of Carpenter & Co., Wilkesbarre, Pa., was badly damaged by fire on the 14th inst., the loss being estimated at $30,000.

That Victor Borgaroff has purchased the Hardware stock of Mrs. Dostal, Waverly, Minn., and will continue the business.

That E. A. Cole's hardware store at Carlton Place, Ont., was robbed on the 17th inst.

That Stephen Allen has started in the Hardware business at Brookville, Ohio.

That the Hardware store of J. C. Rittenhouse, Lee's Summit, Mo., was visited on the evening of the 19th ult. by a well-dressed young man, who asked to be shown the best Gun in the store. The clerk, who was alone in the store, took a $60 double-barreled Parker Gun from the case, and after some hesitation the stranger agreed to buy it, but said he also wanted a box of loaded Shells for the Gun. A box of Shells was handed to him and the visitor loaded the Gun, and leveling it at the clerk's head, said: "Now young man, go to the rear of the store and keep quiet." Thus admonished the clerk obeyed, and the stranger walked out with the Gun and box of Shells and disappeared.

That Leo J. Baumgartner has succeeded Wilson & Baumgartner in the Hardware and Harness business at Armour, S. D.

That the Hardware store at Shelbyville, Ind., conducted by Fisher & Amenroth, was visited by thieves on the 9th inst., and $300 in cash and several Revolvers were stolen.

That burglars entered the Hardware store of Dull & Moorhead, McClure, Ohio, on the 10th inst., and blew off the safe door, totally wrecking the safe. The thieves only secured $30 in cash as a reward for their trouble.

That A. O. Oberholter's Hardware store, at Centerburg, Ohio, was destroyed in a large fire on the 30th ult.

That a fire which occurred at Fayette, Ohio, on October 7, destroyed the Hardware stores of E. S. Perry and W. Acker.

That the Dickinson Hardware Company, Little Rock, Ark., are intending to erect a three-story stone and brick structure which they will occupy on completion. The building will cost from $12,000 to $15,000. It will be 50 feet wide and 150 feet long. Pressed brick and granite are the materials which will be used in its construction.

That I. S. Rist has closed out his Hardware business at Marshalltown, Iowa. Mr. Rist is in ill health and will try farm life for a while.

That the Brooks Hardware Company have been incorporated at Denver, Col., with a capital of $20,000.

That burglars recently broke into the Hardware store of F. J. Simen at Humbird, Wis., and secured $40 worth of goods and some valuable papers.

That O. Beckington, Hardware merchant, Belvidere, Ill., has sold out his business to a new firm consisting of O. Rogers of Elgin and L. C. Cockran of Belvidere.

That W. L. Trimble and Messick & Dryden have purchased the Hardware stock of John W. Lincoln, Liberty, Mo., and will divide it between themselves.

That John L. Thomas has purchased the Smith Hardware stock at Red Oak, Iowa. His son, David Thomas, will have charge of the business.

That O. E. Wheaton of Kenton, Ohio, is thinking of entering the Hardware business at West Mansfield.

That Carl Plumb, Henderson, Iowa, has sold out his Hardware store to West & Martindale of Oakland.

That the store of the Holley Hardware Company, Rathdurm, Iowa, was destroyed by fire on the 27th ult.

Hosted by Google

That Frank Conrad, Hardware dealer, Thomson, Ill., has sold out to Thomas Stagg.

That the Hardware store of Howe & Parish, Klamath Falls, Ore., was recently visited by fire, which damaged the establishment to the extent of $1000.

That Thomas Dunn & Co., dealers in Hardware, New Westminster, B. C., have sold out to A. Godfrey.

That E. S. Perry's Hardware store, at Fayette, Ohio, was destroyed by fire on the 7th inst.

That William G. Hayden, in the Hardware and Tin business, New Bedford, Mass., has sold out to a new firm under the style of James R. Denham & Co.

That S. Z. Hudson has purchased the T. R. Young Hardware stock, at Reedsburg, Wis.

That Mace Bros. have purchased J. A. Shaffer's stock of Hardware at Center Point, Ind.

That C. F. Morrisson, Hardware merchant, Wilkesboro, N. C., is building a new brick Hardware store.

That Charles Hicks and William Hicks contemplate entering the Hardware business at East Bloomfield, N. Y.

That burglars entered the Hardware store of A. Neil, Sauk Rapids, Minn., on the 3d inst., and got away with $60 worth of Revolvers, Razors, &c.

That the Hardware firm of H. W. Mills & Co., Paterson, N. J., has been dissolved, O. W. Mills retiring on account of ill health. The business will be continued by H. W. Mills.

That the Hardware stores of the Prusia Hardware Company and J. W. Ryan, Fort Dodge, Iowa, were burglarized on the 3d inst. At the former place the cash register was rifled and six expensive Revolvers were stolen. At the latter store about $20 in cash and a small quantity of goods were secured.

That C. F. Thompson, Hardware merchant, Brattleboro, Vt., has sold out.

That the stock of Hook & Slosson, Hardware dealers, Sabetha, Kan., was damaged by fire on the 26th ult.

That M. T. Howard's Hardware store, at Rice Lake, Wis., was robbed on the 29th ult. of $400 worth of goods and $40 in cash. The thieves broke the glass in a door in the rear of the store and pushed back the bolt.

That Charles Hawks and Ives Smith have bought the Stove and Tin business of C. W. Smith, Lee, Mass.

That Adams & Ridley, dealers in Hardware, Stoves and Agricultural Implements, Brunswick, Maine, have disposed of their business to Ridley & Jones.

That O. C. Story is now carrying on the Stove and Tin business formerly conducted by Joseph F. Smith at Essex, Mass.

That D. W. C. Nichols & Co., Hardware merchants, Bloomfield, Neb., have sold out to M. S. Goff.

That a copartnership has been formed by Joseph P. Reed and J. Mortimer Darby of North Adams, Mass., who will engage in the Hardware business at that point. The business will be started in a new building which is being constructed with special reference to the needs of the modern Hardware store. The store will be ready for occupancy in a few days, and the firm expect to open their doors to the public about November 1.

That Charles Prather has commenced the Stove and Tin business at Manchester, Ohio.

That burglars entered the Hardware store of C. J. Monson, Abercrombie, N. D., on the 1st inst. and stole three breech loading shot guns.

That Goldcamp Bros. & Co. have purchased the Hardware stock and business of the late H. D. Newcomb, Ironton, Ohio. The price was $11,000. The members of the new firm are John and F. F. Goldcamp and H. C. Rudman.

That James A. Moren has sold his half interest in the Hardware firm of Draper & Moren, Converse, Ind., to A. J. Webb. The style of the firm will hereafter be Draper & Webb.

That the Beyers Hardware Company's store at Colorado, Texas, was destroyed by fire on the 26th ult.

That A. C. Baker of the Hardware firm of Baker & Bissell, Sioux Falls, Iowa, who assigned some time since with heavy liabilities, has settled with the creditors and again resumed business.

That Elwood Brown has sold his interest in the Hardware firm of Wentworth & Brown, Benton Harbor, Mich., to J. J. Baker. The firm style has become Wentworth & Baker.

That H. Moffett & Co., Hardware dealers, Tulare, Cal., have disposed of their business to O. R. Cross & Co.

That on the 29th ult. the Hardware store of C. B. Dobie, Sigourney, Iowa, was entered by burglars who carried off about $200 worth of Pocket Knives and Guns.

That Turner & Archibald, Ridge Farm, Ill., have sold their Hardware store to Jenkins Bros. of Danville.

That T. W. Jameson of Farmer City, Ill., has bought the Hardware and Stove stock of the Leavitt & Ogleve Company, Clinton, Ill.

That the Harper-Reynolds Hardware Company, Los Angeles, Cal., have been systematically robbed during the past two or three months by one of their employees, who during that time has stolen Revolvers and Shot Guns valued at $500 or $600. The clerk has been arrested and has confessed his guilt.

Paints and Colors.

It should be understood that the prices quoted in this column are strictly those current in the wholesale market, and that higher prices are paid for retail lots. The quality of goods frequently necessitates a considerable range of prices.

The general movement has been very fair and in some instances rather ahead of the average for this season of the year. Bulk goods used by glass manufacturers have been in noticeably good demand, as have the lines of Colors that are used largely by wall paper and curtain manufacturers. Grinders have purchased with a fair degree of freedom. In house painters' goods the trade passing is hardly equal in volume to the average of the first half of the month.

White Lead.—Fairly good orders for Dry Lead have been placed by grinders, and the distribution of Lead in Oil was referred to as having been quite satisfactory. Prices remain almost precisely as they were last week, the only irregularity being in quick process and some outside Western brands.

Red Lead.—There has been more inquiry for foreign brands for future delivery and improvement also in actual sales. Prices are somewhat firmer in consequence of this, but not positively higher. Former quotations for American brands remain in force.

Litharge.—Glass manufacturers have placed some fairly large orders for stock for delivery during the next 60 days, the most of which were taken at about former prices. The finer qualities have met with merely routine sales, and quotations remain unchanged.

Zincs.—The demand has been good from grinders, who have been drawing freely upon their contracts. Beyond this nothing is being done as regards new transactions. For the present we quote 4¢ @ 4¼¢ as to quality and quantity. Foreign makes are more or less unsettled as regards some special brands. Consequently it is almost impossible to give correct quotations, though it is claimed that the list price is adhered to.

Colors.—There has been an active business in the lines of Colors particularly adapted to the needs of paper manufacturers, but, this aside, the movement has been confined chiefly to ordinary jobbing distribution. Prices show only slight variation.

Oils and Turpentine.

The market has remained bare of distinctly new or interesting features. Nothing has transpired in any direction that would arouse speculative interest on the part of home buyers and exporters have operated very indifferently. Few changes in prices and only slight ones have taken place, but the rather dull condition of trade serves to impart rather weak undertone in some departments.

Linseed Oil.—Purchases have been almost invariably on a rather small scale and at practically the line of prices that has prevailed for some little time past. It is stated that current prices have been offered for round lots of both Western and city brands for future delivery and refused. Ordinary spot parcels are readily obtained at 40¢ for city and 38¢ for Western brands.

Cotton Seed Oils.—There has been a very fair but irregular business, and prices are still somewhat variable, although not moving very far in any direction. The situation is practically the same as it was a week ago. There is little support outside of what is given by purchases of large Western consumers direct at the producing points.

Lard Oil.—Pressers are very firm, asking as high as 77¢ @ 78¢ in some instances, and turning down all bids of less than 75¢ for prime Oil. Business has been slow, however, and the demand at present is moderate.

Fish Oils.—No important movement in any variety of crude products has taken place, and there is little business under way at the present time. The pressed and bleached Oils are selling fairly at old prices.

Miscellaneous.—Olive and Cocoanut Oils have remained quiet and unchanged. Red Oils have met with better sale at previous rates.

Spirits Turpentine.—The movement in prices has been very narrow, not exceeding ½¢ ℔ gallon, and business has been of commonplace type. Late dealings were at 29¢ for regular and 29½¢ for machine barrels.

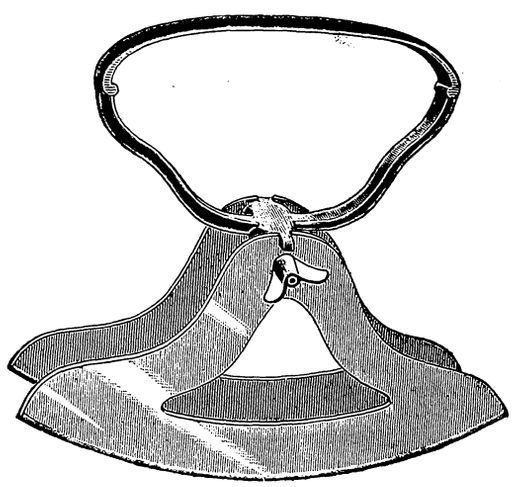
Streeter's Mincing Knives.

N. R. Streeter & Co., Groton, N. Y., are putting a line of mincing knives on the market, as herewith shown. The handles are cast iron with detachable nickel plated blades. The blades are of

Fig. 1.—Streeter's No. 10 Mincing Knife.

fine steel so that they can be sharpened, and are made in skeleton shape to prevent clogging. Fig. 1 represents the one-bladed knife, the blade being held



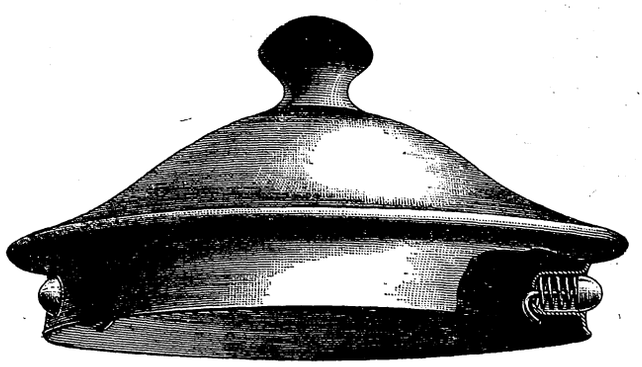


Fig. 2 —Duplex Mincing Knife.

securely by a screw passing through the plates on both sides. In the Duplex knife, Fig. 2, the blades are held in position by a square shouldered bolt with a thumb screw. The blades of the Sensible knife, Fig. 3, are held by a heavy bent wire hook with a nut on the top. The knives, Figs. 2 and 3, have lugs or grooves to prevent the blades from turning and to assist in holding them rigidly in position. Thus the blades can be easily removed for sharpening or cleaning. The durability and attractiveness of the goods are features emphasized by the manufacturers; also the low price at which the knives can be sold, the Sensible, Fig. 3 for instance, being designed to retail for 25 cents each.

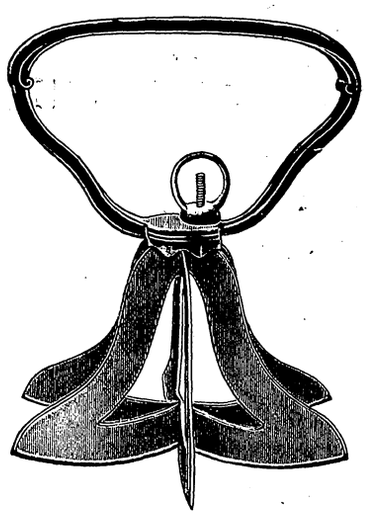
THE NUMBER of the Sun Mfg. Company's Receptacle Mill, an illustrated description of which appeared in our issue of October 5, 1893, should have been No. 1080, instead of 1085, as given. Their Mill No. 1085 is of entirely different construction, having a sunken metal hopper and closed swing cover top.

Cover with Springs.

Boas Brothers, 231–325 Greenwich street, New York, are using their patented springs on tea and coffee pot

Cover with Springs.

mant enameled ware, as illustrated herewith. The springs and knobs are made of brass to prevent rusting, the spring holding the knob against the inside of the rim of the pot with enough force to prevent the cover from falling off when pouring from the pot. There is no offset on the inside of the pot's rim, so the cover may be lifted off almost as easily as if the springs were not there.



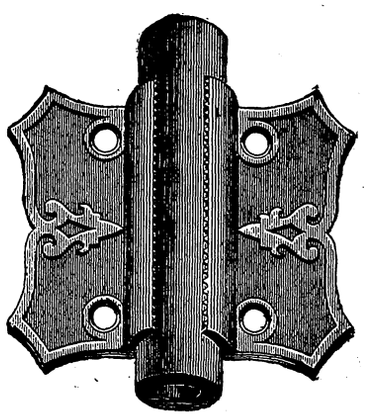


Fig. 3.—Sensible Mincing Knife.

Champion Egg Opener.

The Champion egg opener is offered by the Magic Introduction Company, 321 Broadway, New York. The handles are loop shape, similar to scissors handles. The curved pieces which surround the egg are provided with sharp teeth, so as to cut off the top of the egg shell. The opener is designed for table use, to obviate the unpleasant results that accompany opening soft boiled eggs with a knife or spoon ; also for use in the kitchen, by which the contents of the egg are exposed while yet in the shell, thus avoiding the spoiling of a bowl full of good eggs by dropping a bad one into them. The openers are made in nickel and silver plate, embossed, the silver plated ones being put up in satin lined cases.

Evory's Plumbers' Tacks.

The illustration herewith shows a plumbers' tack, now being introduced to the trade by the Evory Mfg. Company, 21 and 23 Ann street, New York. It is made of cast iron, and furnished either plain, tinned or nickel plated. The claim is made that the device does not need to be soldered to the pipe, thereby saving

Evory's Plumbers' Tack.

time and material. The jaws are ridged and so made that the tighter the screws that fasten up to the wood work are

Hosted by Google

turned the tighter they grip the pipe, tests having shown, it is claimed, that they will sustain a strain far in excess of any that is likely to be put on a lead pipe. Several new modifications have recently been added to the variety,

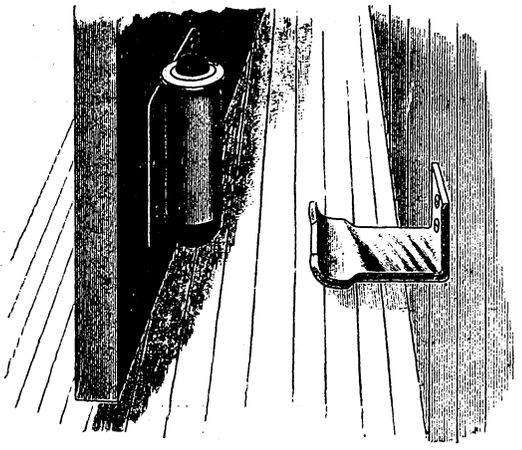

Fig. 1.—No. 155 Door Stop and Holder.

adapting them to all the requirements for ceilings, side walls, corners, cornices, &c. One form is made to hold two pipes for the flush and supply of water closet tanks and for holding bibbs or T-branches. Their quick adjustment and wide usefulness have made them popular with plumbers who have used them.

Solid Steel Putty Knife.

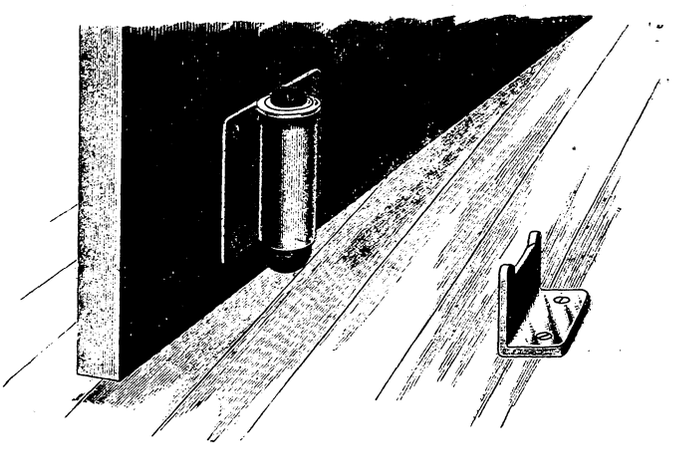
The accompanying cut represents a solid steel putty knife, put on the market by Charles J. Healy, 106 Chambers street, New York. The knife is forged from a solid piece of steel, resulting in a handle and blade in one piece. The handle is embossed, and the whole knife nickel plated. A feature of the knife is the low price at which it is supplied to the trade, selling as it does at $1 per dozen.

Solid Steel Putty Knife.

THE STOCK of Hardware, Nails, Iron and Steel, &c., of C. F. Thompson & Co., Brattleboro, Vt., has been disposed of to Mellen & Proctor and Robbins & Cowles, who conduct the only other Hardware stores in the town. Mr. Thompson retires from business after an experience of over 47 years as clerk, partner and principal in the same store.

Forg's Adjustable Door Stop and Holder.

The door stop and holder shown in the accompanying cuts is put on the market by P. Forg, Somerville, Mass. The door stop consists of a bolt and spring inclosed in a casing, which is fastened on the door. The bolt can be readily extended and adjusted with an ordinary screw driver. The holders are made of brass, the one shown in Fig. 1 being intended for use on the mop board or wall, and can be used at either the top or bottom of the door. The holder in Fig. 2 is for use on the floor, where the opening of a door too wide would cause the door to strike against a desk or other article of furniture. The stops and holders are made in two sizes, 2½ and 3 inches.



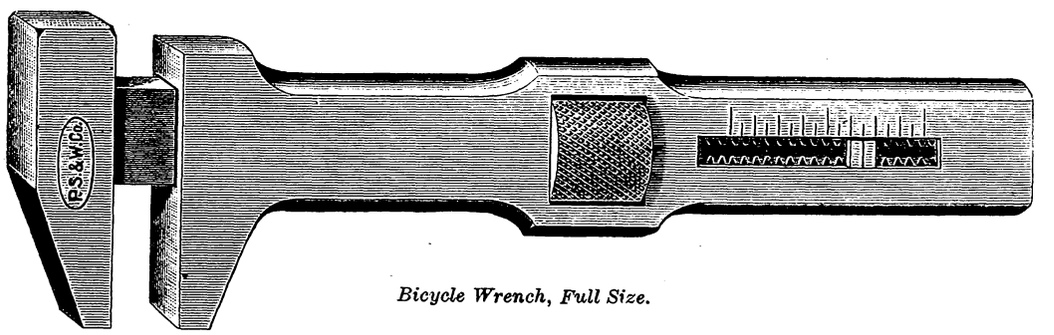


Fig. 2.—No. 156 Door Stop and Holder.

Bicycle Wrench, Full Size.

Bicycle Wrench.

Peck, Stow & Wilcox Company, Southington, Conn., and 27 Chambers street, New York, are introducing a bicycle wrench, as shown in the accompanying full size cut. The wrench is all of forged steel, polished and nickel plated. It is provided with a scale so that it can be readily adjusted to any sized nut or screw or bolt. The parts are designed strong enough to withstand all necessary strain without making it too heavy for bicycle use.

The Royal Heater.

The Plume & Atwood Mfg. Company, 18 Murray street, New York, are offering the trade a heater to be used in connection with center draft lamps or argand gas burners, as shown in Fig. 1. The heater is made of full nickel plated metal and is easily attached to a lamp, as in Fig. 2, and as easily removed. The heater is so constructed on top that small vessels containing water for shaving or other purposes, or milk or food for infants or the sick, may be quickly heated. It is remarked that the heater is constructed on the principle that it creates an increased or forced draft, not only through the chimney, whereby the combustion is made more perfect, but also under the

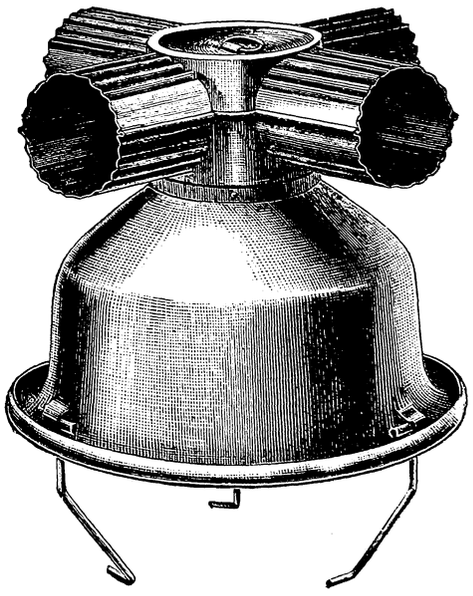

Fig. 1.—The Royal Heater.

Hosted by Google

shade, so that the cold air is constantly drawn under the shade, and being heated by the surface of the hot chimney, ascends to the heater, where it is still further heated by direct influence of the flame before it is discharged into the room. The manufacturers point out that this is a convenient, attractive, efficient and inexpensive mode of heating; that the device will heat small

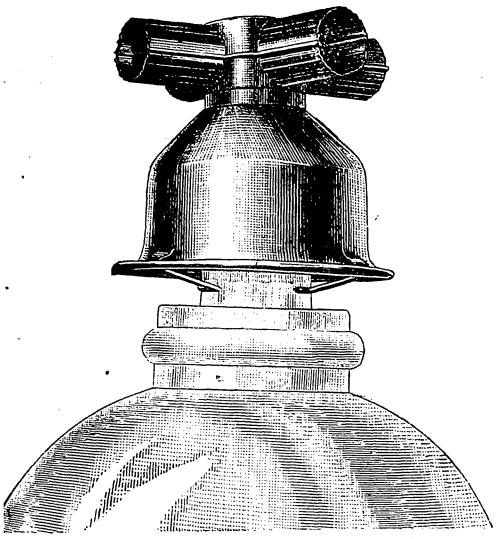

Fig. 2.—Position of Heater on Chimney.

rooms, bedrooms and bathrooms without the use of other heat; that it is a valuable auxiliary in any size room in damp and extremely cold weather and that as a result of better combustion the heater saves 20 per cent. of the oil. The makers state that the best results are obtained by using the heater with their Royal and Banner lamps, though it is adapted to any center draft lamp or argand gas burner.

Crescent Lock Joint Stove Pipe.

The accompanying cuts represent Crescent lock joint stove pipe, introduced by Logan, Gregg & Co., Pitts-

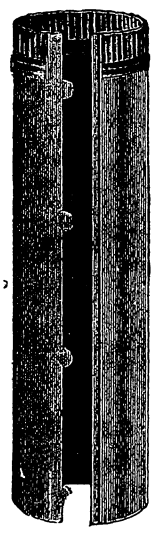

Fig. 1.—Showing Lugs and Groove.

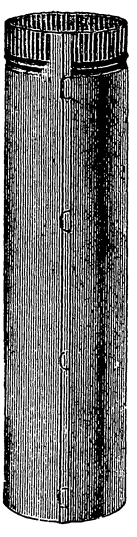

Fig. 2.—Lugs Turned Back.

Crescent Lock Joint Stove Pipe.

burgh, Pa. One edge of the iron is grooved and pierced, as shown in Fig. 1, to receive the lugs formed on the other side. When joined the lugs are turned back, as in Fig. 2, holding firmly, it is stated, and making a perfectly smoke tight joint. The pipe is made in 4, 5, 6 and 7 inch sizes, packed as in Fig. 3, in crates of 25 joints, for shipment. The manufacturers state

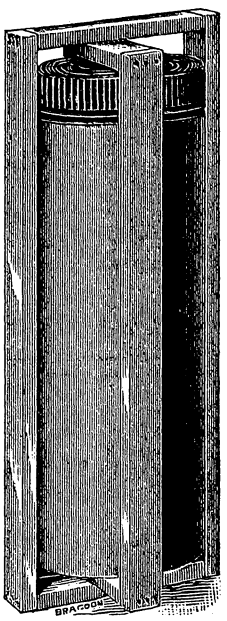

Fig. 3.—Manner of Crating Pipe.

that they are having a large demand for the pipe wherever it has been introduced.

G. W. WHITING, who has for a number of years been representing Sickels, Sweet & Lyon to the nearby trade, is still using as a pocket price book one of the catalogues of Walsh, Coulter & Flagler, with whom he was formerly connected. This catalogue bears date 1876, is without illustrations and contains lists of the leading goods in a compact and convenient form. It has, however, been in use for about 17 years and there is scarcely a list which has not been repeatedly changed, so that it is interesting to observe the succession of interlineations, erasures and corrections which have been made on its pages. It is also curious to note the changes which have occurred in the line of goods to which it is devoted. Mr. Whiting is now about to retire the book from active service and to put in its place one of *The Iron Age* Hardware Price Books, Style B, on the pages of which with much systematic care he has already entered list prices and discounts on the large and varied line of goods which he is offering to the trade. The Standard Hardware Lists are also made use of. In some cases where it is desirable to have illustrations of the goods, Mr. Whiting has made miniature sketches, preferring to do this rather than to insert the manufacturers' cuts, which in most instances are too large.

THE ANNUAL CONFERENCE of the National Paint, Oil and Varnish Association will be held in the Monongahela House, Pittsburgh, commencing on Tuesday, November 21, and will probably continue in session three or four days. The Pittsburgh Paint and Drug Club are making extensive preparations to receive their guests, and a number of excursions to different points of interest in and about Pittsburgh have already been arranged. It is also probable that a banquet will be given the delegates during their stay in Pittsburgh.

Current Hardware Prices.

OCTOBER 25, 1893.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

The character @ is used to indicate a range of price; thus discount 50&10@50&10&5 % signifies that the goods in question are sold at prices ranging from discount 50 and 10 % to discount 50 and 10 and 5 %.

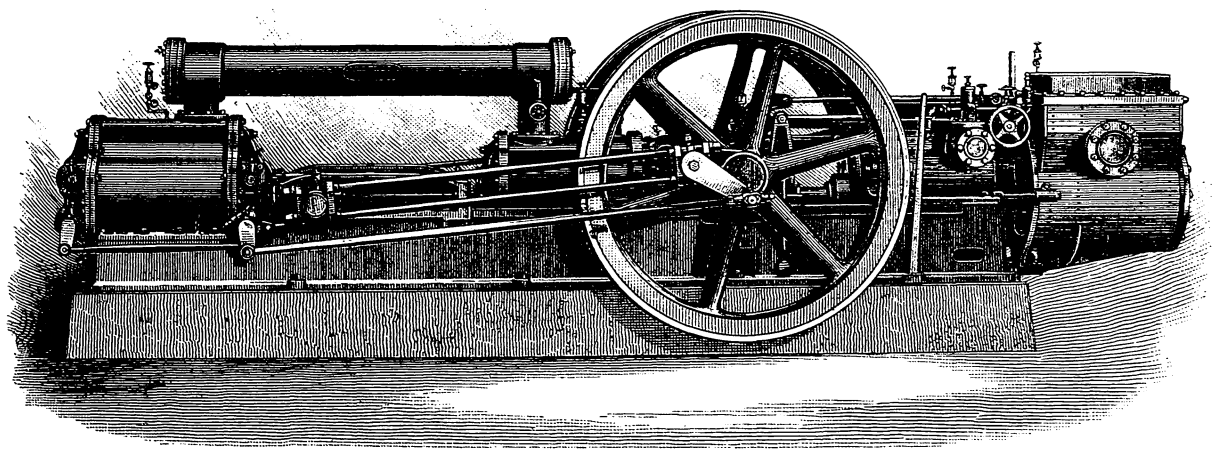
THE IRON AGE

THURSDAY, NOVEMBER 2, 1893.



The Norwalk Double Compound Air Compressor.

We have the privilege on this and the following pages to present in perspective and vertical section engravings showing the main features of the 28 x 30 inch double compound air compressor built by the Norwalk Iron Works Company of South Norwalk, Conn.

Steps Leading to Present Construction.

Before describing the compound air compressor as at present designed, it may be of interest to briefly outline the various steps through which the machine passed before reaching its present development, confining this matter to the compressor as developed by the company above referred to. In their compound air compressor as built in 1880, a compressing air cylinder was placed between the steam and the intake air cylinders. The air valves were of the poppet variety, of the most improved construction and very liberal in area. Both air compressors were provided with water jackets. The air was taken into the large cylinder, where it was partly compressed and from which it was conducted by a large pipe to the smaller compressing cylinder, where it was compressed to the desired pressure. These cylinders were similar, although, of course, the operation was reversed, to the cylinders of a compound steam engine, the low pressure cylinder being the intake and the high pressure the compression cylinder. The objects aimed at in this construction, were: 1. To make the resistance of the air to compression an average resistance throughout the stroke, instead of the excessive and maximum resistance at end of the stroke, which is obtained in all single compressors. 2. To reduce the losses of clearance spaces to the smallest amount by having the pressure in the intake cylinder a light pressure. 3. To have the advantages of two water jackets and more time for cooling the air.

The next change was the addition of an intercooler between the two air cylinders, which consisted of a large pipe or reservoir filled with thin brass water pipes. The air in its passage to the second cylinder becomes divided into thin streams by the water pipes and thus each particle is brought into contact with a cold surface and its temperature rapidly reduced. This was found, as will be explained further on, to produce economic results of a degree unlooked for. The reason for its introduction and the reason for its maintenance at the present time may be briefly stated. The compression which takes place in the initial cylinder heats the air, which if allowed to pass directly to the compression cylinder would fill that cylinder with gas at a certain temperature and certain volume. It is evident that by reducing the temperature the volume of air that would be introduced in the second cylinder would thereby be increased and the capacity of the machine correspondingly augmented.

THE NORWALK DOUBLE COMPOUND AIR COMPRESSOR.

Another important change made shortly afterward was the doing away with the poppet inlet valve and the introduction of one inlet valve of the Corliss steam engine pattern placed in each head of the intake cylinder. This improvement did away with much trouble caused by the little poppet valves and, furthermore, had the advantage of insuring a full supply of air at every stroke. The valves were opened and shut by a connection with the main engine shaft and no vacuum or pressure in the air cylinder was needed to insure their proper working.

The next change, while retaining the Corliss valve, was in the valve connections, which were made more direct by employing a wrought iron return crank attached to the main crank pin. This pattern also had removable air hoods which connected the inlet valves with the cold air conduit beneath the floor, through which cold air from outside the engine room was led to the compressor. This was introduced for the reason that it is far preferable to obtain air as cold as possible and also as free from dust particles and vapor as possible, the pure cold air not only adding to the economy of the machine, but also increasing its durability. Tests showed that this method of obtaining air from outside rather than from the engine room secured a saving of about 1 per cent. for every 5° lower temperature obtained.

The Corliss valve for admission of air having proved to be such an important improvement, its use was still further extended in the next pattern, and it was applied as a discharge valve on the intake air cylinder, as illustrated in Fig. 2.

The amount of compression which is performed in the intake air cylinder is always uniform, for the reason that the pressure produced here is simply the pressure required to compress the air into the smaller or compressing cylinder. Hence there being a uniform discharge pressure for this cylinder it is a simple matter to adjust a mechanically moving discharge valve to open at the exact and proper point of discharge. This arrangement has proved to be highly gratifying and has been adopted for all these standard compressors.

Although the next change involved no alteration in the general features of the machine it covered important points in the details where experience had shown that changes might be made conducing to the better working of the compressor or for other advantages to the user. An automatic pressure regulator of new and patented design was attached to the steam cylinder. Lubricators of new design were also placed on the air cylinders having sight feed and fine adjustment.

The next change of importance was in the valve gear. In the usual patterns of the standard Norwalk compressor air pressure in the inlet cylinder at the period referred to was about 25 pounds. This pressure was so light that its effect on the wearing of the Corliss valve had been regarded as of little consequence, but the demand having been made for compressors for pressures to thousands of pounds to the square inch made it expedient to use higher pressure in the inlet cylinder. The valves were, therefore, moved by cams, the shape of which was such that the valve remained at rest until the pressure below it had become nearly equal to that above it. Then the movement commenced and the valve was quickly thrown wide open. In closing, the cam allowed a rapid movement, so that the valve be-

Hosted by Google

came seated before any considerable pressure came upon it. The connection which threw it shut was elastic, so that if a valve seat became dry no cutting occurred. This form of movement having such desirable features for heavy pressure was considered to be in a degree useful on any pressure, and was therefore adopted for the standard compressors.

Description of Compressor as Built Now.

Ordinary poppet valves were considered to have serious objections when used for inlet valves. They are closed by springs, and to insure prompt closing at all speeds, especially when the valve stems became foul with dust and gummy oil, the springs must have quite a little strength. Springs exerting a force of less than 8 ounces per square inch of valve surface are too weak. The slight throttling of the inlet by these springs, although scarcely to be seen on indicator cards of the usual scale and taken in the ordinary way, causes loss amounting to 3.41 per cent. in capacity at the sea level, while at higher altitudes it is greater. These and other considerations led to the adoption and retention of the well-known Corliss valves, which have a positive movement from the main shaft. With these the port is large, is clear of obstructions and opens directly into the cylinder. Indicator cards when running at 250 revolutions and at piston speeds up to 500 feet a minute have been taken of these compressors. With ordinary indicator springs no vacuum is discernible, but with an extremely light spring of only 4 pounds to the inch the slightest indication of a difference of pressure within and without the cylinder can be detected.

The process of compression has two interesting features—viz, the increasing resistance to the advance of the pistion and the increasing temperature of the air due to the compression. A steam engine is usually the source of power. In the steam cylinder the pressure is greatest at the beginning of the stroke and least at the end, while in the air cylinder the direct reverse is the case. To equalize in some measure this vast difference between power and resistance has been the task presented to the ingenuity of mechanics. The most common method of overcoming this difference has been in the employment of heavy fly wheels and extra strong connections. We quote from a pamphlet on these compressors, from which most of the particulars here presented are taken, which has just been issued by the Norwalk Company.

"To obtain nearly uniform resistance the air cylinder should be conical, large at one end and small at the other. Of necessity this would be single acting, and the piston should be capable of expanding and contracting to fill the bore of the cylinder at any point. In such a cylinder at the first of the stroke, when the piston is large, it would encounter a light pressure, but at the last of the stroke, when the pressure is very great, the piston would be small and the engine would be able to overcome the resistance with ease. A machine constructed in this manner is in the present state of the art an impossibility. Its result is, however, very closely imitated in the Norwalk compound air compressor, in which a large cylinder is employed to make the initial air pressure, while a small cylinder is used to effect the final and heavier compression. The air is forced from the larger cylinder into the smaller, and in the smaller

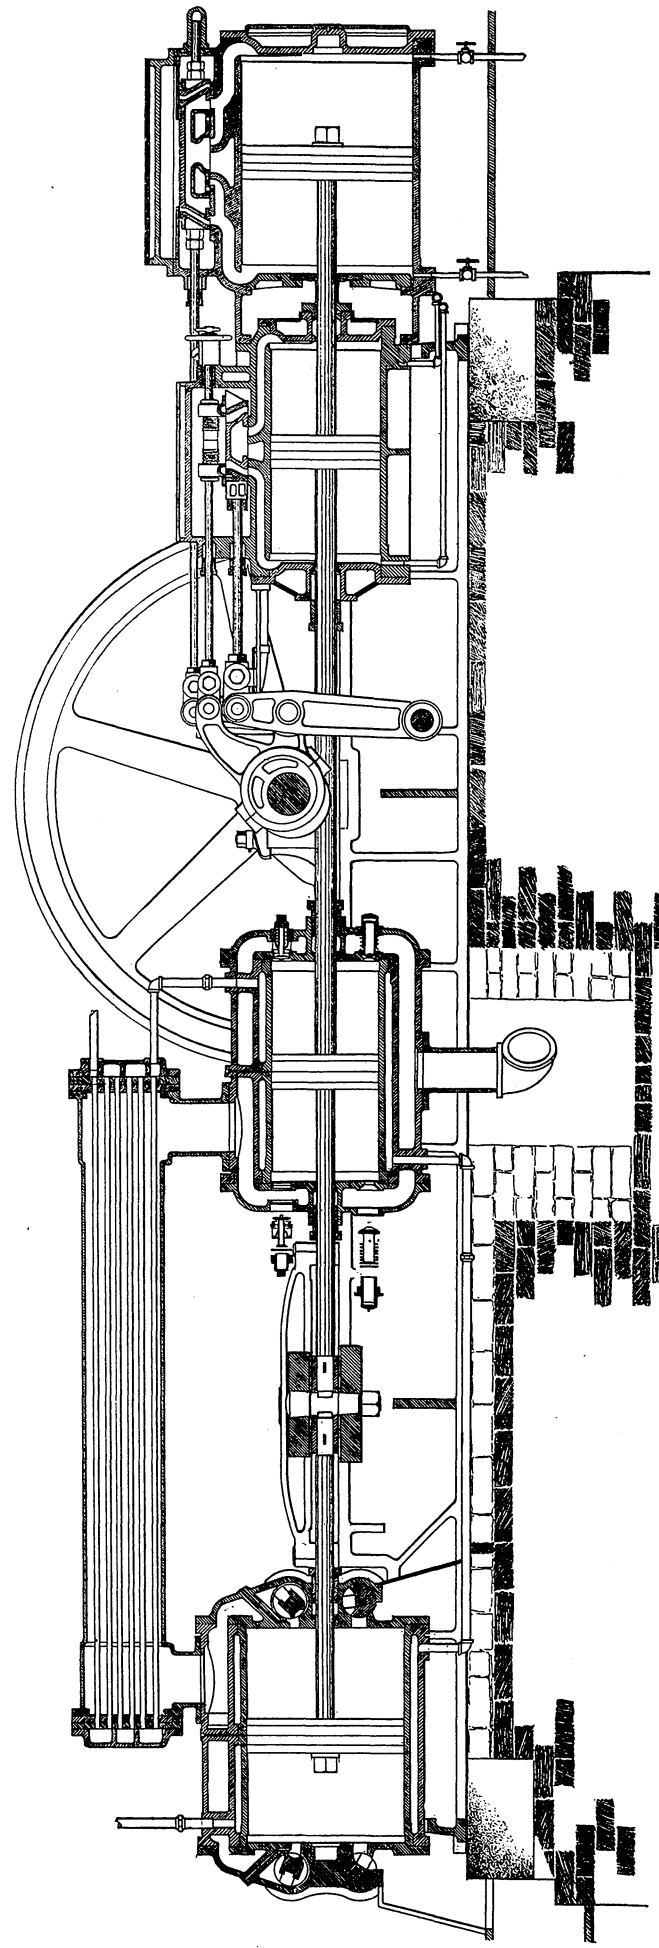


Fig. 2.—Vertical Longitudinal Section through all the Cylinders.

THE NORWALK DOUBLE COMPOUND AIR COMPRESSOR.

Hosted by Google

cylinder is compressed to the extent desired. By such an arrangement much of the resistance is transferred from the end to the beginning of the stroke, and a more nearly uniform resistance for the whole stroke is obtained."

A large air cylinder, that on the left in Fig. 2, determines the capacity of the compressor. Assuming this to have a sectional area of 100 square inches, the small air cylinder would have an area of 33⅓ square inches. The small piston only encounters the heaviest pressure and at 100 pounds pressure the resistance to its advance would be 3333 pounds. The resistance against the large piston is its area multiplied by the pressure which is caused by forcing the air from the large cylinder into the smaller cylinder. In this case it is 30 pounds per square inch, but as this pressure acts on the back of the small piston and hence assists the machine, the net resistance of forcing the air from the large into the small cylinder is equal to the difference of the area of the two pistons multiplied by the 30 pounds pressure. This is 66⅔ by 30 and equals 2000 pounds. The resistance to forcing the air from the larger into the smaller cylinder, plus 3333 pounds, the resistance in the smaller cylinder to compressing it to 100 pounds, is the sum of all the resistance in the compound cylinders at the time of the greatest effort and is 5333 pounds. The time of the greatest effort is at the end of the stroke or when the engine is passing the center. It is stated that in the single machine this resistance has been seen to be 10,000 pounds and hence in the compound machine the maximum strains are less by over 46 per cent. or nearly one-half. By thus reducing the work to be done at the end of the stroke, more work is done in the first part of the stroke and the resistance is made nearly uniform for the whole stroke.

The next step is to render the application of power also uniform for the whole stroke. This is accomplished in a very simple and effective manner. The steam and air pistons and cross head are mounted on the same piston rod. These parts have considerable weight, so that it requires most of the power of the steam over and above the air resistance at the beginning of the stroke to start them forward at the required speed. At the end of the stroke, when the steam has become weak by expansion, the power stored up in the momentum of these reciprocating parts is given out in useful work, and the parts are brought to a state of rest by expending their force upon the air in compressing cylinders. As the energy which can thus be stored and given out by the reciprocating parts depends upon their weight and the square of the number of revolutions, it is evident that rotative speed is the most important factor. Hence very long strokes are not desirable, because at the same piston speed the machines make fewer revolutions than machines of shorter strokes. Therefore, the power is not applied to the work so uniformly, and greater strains are brought on shafts, connecting rods and other parts, while larger fly wheels and frequently double engines are necessary for successful operation, especially where steam is to be used expansively.

The uniform resistance and uniform power both applied, as in this compressor, and direct end thrust and pull through a straight steel piston rod, do not leave much work for fly wheels to perform. Their presence is necessary, however, to regulate the steam valve motions, to control the length of stroke, to even up and balance trifling inequalities of power and resistance, and to secure a uniform speed to the machine.

No water is allowed in the cylinders in contact with the air and all cooling is effected by surface coolers. This intercooler is shown connecting the two air cylinders above which it is placed. The advantages of surface cooling in comparison with the use of water in the air cylinders are stated to be several. The first consideration is that the product of compression with surface cooling is dry air. This is a matter of much importance. When the air is heated by compression and brought in contact with water it becomes saturated with moisture. Air when exhausted after doing work has a temperature far below zero. So low a temperature quickly freezes up all moisture in the air and deposits it as ice in the exhaust passages of the air engine, which in a short time are choked up or entirely closed. The remedy for these evils is to keep the air dry.

The value of cooling attachments is that they effect a direct saving of the power required for compression, and by keeping the parts cool make it possible to obtain thorough lubrication. Air compressed to five atmospheres, or 60 pounds pressure on the ordinary gauge, in a compressor without cooling arrangements, would be raised in temperature from 62° to 373° F. Assume that the amount of air is such that it requires an engine of 100 horse-power to do the work. If now a perfect cooling apparatus be added to the compressor, the power required would be reduced from 100 down to $78\frac{4}{10}$ horse-power. Or in other words the value of a perfect cooling apparatus to that compressor would be $21\frac{6}{10}$ horse-power. So much cooling cannot be obtained from a single cylinder jacket for the reasons already cited.

In the compound compressor doing the same work the temperature of the air on leaving the first cylinder would be 199°, if the cylinder had no jacket. All this heat above the atmospheric temperature can be taken out in the intercooler. By thus cooling the air the original 100 horse-power required will be reduced to $88\frac{1}{10}$ horse-power. We have seen that by perfect cooling another gain of $9\frac{7}{10}$ horse-power is possible. For this a water jacket is put on each of the two air cylinders, which return a useful effect of $4\frac{85}{100}$ horse-power. It is, therefore, concluded that in a 100 horse-power compressor when compressing to 60 pounds it is possible to gain $21\frac{6}{10}$ horse-power by perfect cooling.

The steam engine attached to these standard compressors is designed to attain the highest economy, the one shown in the engraving being of the tandem compound type. The steam cut off valves have a wide range and are quick in their action, giving a clear sharp point of cut off and a very perfect expansion line. The cut off is changed by turning a hand wheel placed at the back end of the high pressure steam chest and it is easily accessible. The point of cut off can be changed while the machine is in motion to meet any requirements of speed. Its position is shown by an index. The general arrangement of the steam cylinders, their valves and the connections with the eccentrics, which are placed on the shaft which carries at each end a fly wheel, are clearly brought out in the sectional drawing.

The experience gained in building a large number of machines by this company, and careful investigations with the indicator, have resulted in the production of an engine particularly well adapted for this duty.

Launch of the Battle Ship "Oregon."

The United States battle ship "Oregon" was successfully launched from the yard of the Union Iron Works, at San Francisco, Cal., on Thursday, October 26, in the presence of an immense crowd of people, including some of the most prominent representatives of the States of Oregon and California. The "Oregon" is one of the three ships the bids for which were opened at the Navy Department, on October 1, 1890. These ships are technically known as armed coast line battle ships of the first class. The two sisters of the "Oregon" are the "Massachusetts" and "Indiana," both of which have been constructed at the yard of the Cramps, in Philadelphia. By a provision of the act of Congress authorizing their construction it was directed that one of the three vessels should be built on the Pacific coast, and the contract was awarded to the Union Iron Works, at San Francisco. The appropriation for each ship was $4,000,000, exclusive of armament. The "Oregon" is similar in all respects to her sister vessels, and is of great fighting power, with adequate protection in strength of armor. Her length on the water line is 348 feet, extreme breadth 69¼ feet, and draft 24 feet, the latter feature being designed to enable her the better to navigate the shallow waters of the American coast. Her displacement will be 10,200 tons, her maximum speed 16.2 knots, and sustained sea speed 15 knots. The vessel has a powerful ram bow.

The armor of the ship lies in a water line belt, which rises 3 feet above the water and extends to a depth of 4½ feet below the water. This armor belt consists of 18 inches of the most improved type of modern armor. Rising from this water line belt at each end are armored redoubts of 17 inches in thickness. These redoubts extend above the main deck 3½ feet, and give an armored freeboard of 15 feet 2 inches. These redoubts protect the turning gear of the turrets and all the operations of loading. The turrets are designed to be inclined. They are 17 inches thick and are powerfully strengthened. The horizontal thickness of the inclined turrets is 20 inches. The side armor belt of the "Oregon" is backed by 6 inches of wood, two ¾-inch plates and a 10-foot belt of coal. Above the water line armor belt the "Oregon" has 5 inches of armor protection.

The battery of the "Oregon" will consist of four 13-inch breech loading rifles; 20 6-pounder rapid fire guns; 6 1-pounder rapid fire guns; two Gatlings, and six torpedo tubes; constituting a weight of armament equal to that of any modern battle ship of the foreign powers. The engines of the ship are of the twin screw, vertical, triple expansion, inverted cylinder type, placed in water tight compartments and separated by bulkheads. The diameters of the cylinders are: High pressure, 34½ inches; intermediate, 48 inches, and low pressure 75 inches, with a 42-inch stroke. There are four double ended and two single ended auxiliary steel boilers of the horizontal return fire tube type. The main boilers will be about 15 feet outside diameter and 18 feet long. The auxiliary single ended boilers will be about 10 feet 2 inches in diameter and 8½ feet long.

Single Boiler Punching Machine.

The accompanying engraving represents a machine intended for general punching on boiler work, but which is particularly arranged for punching close in the corner of flanges, the punching tools moving out to the extremity of the lower jaw when such work is being done. The machine illustrated has capacity to punch a 2-inch hole through 1⅛ inch metal, or a 4½-inch hand hole through ¾ inch metal, and is shown with throat 50 inches deep, which will punch to the center of 100-inch plates. The throat is made various depths, from 12 to 60 inches.

The tools shown attached to the machine are for punching rivet holes; these tools are easily and quickly removed and others attached for punching hand holes, flue holes, &c.; shears, either cross cut or splitting, can also be used. Flue and hand hole tools are shown lying on the floor.

The machine is driven by a heavy steel cam shaft, and a hand wheel is provided in front for setting the tools. An automatic stop is provided which brings the slide to rest at completion of the stroke. The attached steam engine, with governor, makes the machine self contained and independent of belting and shafting. When desired, tight and loose pulleys are furnished for driving by belt. The makers are the Long & Allstatter Company of Hamilton, Ohio.

SINGLE BOILER PUNCHING MACHINE.

The Riedler Compressor.

L. de Thurrimont has reported in the *Génie Civil* the results of the coal consumption trials of the Riedler air compressors at Paris. The plant consists of four triple expansion Corliss engines of 2000 horse power each, with 20 Babcock & Wilcox boilers, furnished with Green's economizers, the whole made by Schneider & Co. of Creusot. The specification prescribed as a maximum for coal consumption on trial, 1.54 pounds per indicated horse-power per hour, the fuel being Anzin briquettes. The trial was to last eight hours, the speed to be 60 revolutions per minute, the steam pressure on the high pressure pistons about 150 pounds per square inch, and the compressed air pressure 114 pounds per square inch. A deduction was to be made from the total consumption for condensation in the steam pipes. The eight hours' trial was divided into 16 periods, and diagrams taken simultaneously from the three cylinders in the middle of each period. The condensation in the steam pipes was ascertained by special experiments subsequently. The results of the trials showed, for a total indicated horse-power of 1996, a consumption of 1.29 pounds per indicated horse-power per hour.

Other experiments, made in December, 1891, on the efficiency of the machinery, to determine the ratio between the indicated work done by the air pistons and the indicated work in the steam cylinders, showed a ratio of 0.8997. The engines had then only been in use a few days.

A device recently introduced by an Ohio trolley road is calculated to prevent collisions between electric cars and railroad trains. The appliance consists in a safety switch for railroad crossings, which is so constructed that an electric car cannot pass a railroad track until the conductor or motorman has first crossed the track and set the switch. The idea is to compel the conductor to precede the car to the track, and so make a collision almost an impossibility.

Crowds of unemployed workmen are said to be flocking to San Francisco on the chance of getting work on the midwinter fair. The city has already more unemployed of her own than she can care for.

The Sague Galvanizing Machine.

Samuel A. Sague, vice-president of the Britton Iron & Steel Company of Cleveland, has invented a galvanizing machine which is in operation at the mill in question. The machine galvanizes 3000 sheets per turn of ten hours at a labor cost of $6.30 per day, the force being two men and a boy. In the ordinary dipping pot process the daily product is 800 to 1000 sheets at a labor cost of $10.25 for a crew of seven men and one boy. There is also some saving in acid and a lessened consumption of spelter.

The object of Mr. Sague's invention is to substitute continuous galvanizing for the ordinary process, which is described as follows:

The sheets or plates, as received from the rolling mills, in all cases, are first immersed in what is called a "pickling bath" which is composed of sulphuric acid heated in any suitable manner, the object of thus pickling the sheets or plates being to clean the same—that is, to remove scales and dirt that may be adhering to the surface of the sheets or plates. The action of the sulphuric acid, however, produces a spongy and irregular surface, the original smooth surface of the sheets or plates being destroyed. After pickling, the sheets or plates are washed in a tank of water; thence taken and laid upon a table and scraped by hand. Workmen, by means of hand scrapers, remove dirt and scales that still adhere to the sheets or plates. The work last referred to is not only necessarily slow and laborious, but it is almost impossible to thus satisfactorily remove all impurities and foreign substances from the surface of the sheets.

Next the surfaces of the sheets or plates are prepared for the zinc or spelter coating by immersing the sheets or plates in a tank supplied with muriatic acid, resulting in the formation of a flux upon the surfaces of the sheets or plates to enable the zinc or spelter to adhere thereto more closely and serving also to still further and more thoroughly clean the sheets or plates.

The sheets or plates undergoing treatment must be thoroughly cleaned preparatory to their immersion in the zinc or spelter bath. From the muriatic acid bath the sheets or plates are loaded on an iron car and conveyed to a kiln, where the sheets or plates are thoroughly dried. When dried the sheets or plates are ready for the zinc or spelter bath. This loading and unloading of the sheets or plates and their transportation to and from the kiln also requires much labor and time. The sheets or plates are next, with a longitudinal edge lowermost and in batches, immersed or dipped in the zinc or spelter bath. A tank or pot, as it is technically called, is filled with melted spelter or zinc, which is kept liquid by coke fires constantly burning around the tank or pot, the zinc or spelter bath being protected in any suitable manner to prevent oxidation of the molten metal, and sal ammoniac or a suitable flux being employed to give the coated sheet or plate a brighter appearance. Workmen handle the sheets or plates by means of tongs.

The treatment of the sheets or plates by the means just described is not only objectionable in that it is exceedingly slow and laborious, but the sheets or plates are not coated with uniformity. Some sheets or plates remain in the bath longer than others, and consequently the coating of the different sheets or plates of a bath varies in thickness. Then again, in withdrawing the sheets or plates from the bath it is impossible, by the means just described, to withdraw them at a uniform speed, and the sheets or plates are very liable to be jerked. This irregularity in the withdrawal of the sheets or plates from the bath causes the spelter to adhere to the sheets or plates unevenly and in patches, resulting in a waste of zinc or spelter, which is the more costly metal. Since the sheets or plates are placed in the tank lengthwise on edge, in withdrawing the same from the bath the molten metal coating of the sheets or plates necessarily gravitates to the lowermost longitudinal edges of the sheets or plates, resulting in an objectionable increase in thickness in the coating along these edges. After being coated with zinc or spelter the sheets or plates are wiped by hand, usually by means of canvas. The sheets or plates are lastly run singly through calendering rolls, for the purpose of straightening and smoothing them and putting them in good condition for shipment.

The continuous process which Mr. Sague uses in his machine pursues a more rational course. The accompanying engraving shows the apparatus designed. Mr. Sague pickles the sheet of iron or steel as heretofore and places it upon a table, A, at one end of the apparatus. From table A the sheet is fed to cold rolls, B, located in the required proximity to the delivering end of the table A and being of any suitable construction. Table A declines somewhat toward rolls B to facilitate the feeding of the sheet, water being discharged upon the rolls by means of the perforated pipe W to keep them clean. The effect of powerful cold rolling under water, after pickling the sheet or plate, is pronounced of vast importance by Mr. Sague, not only entirely removing the irregularities in the surfaces of the sheet, which irregularities are the result of the action of the pickling acid, but rendering the surfaces of the sheet or piate beautifully smooth and crushing and washing away all impurities and foreign substances. Rolls B deliver the sheet to the muriatic acid coating vat C. At the receiving end and ex-

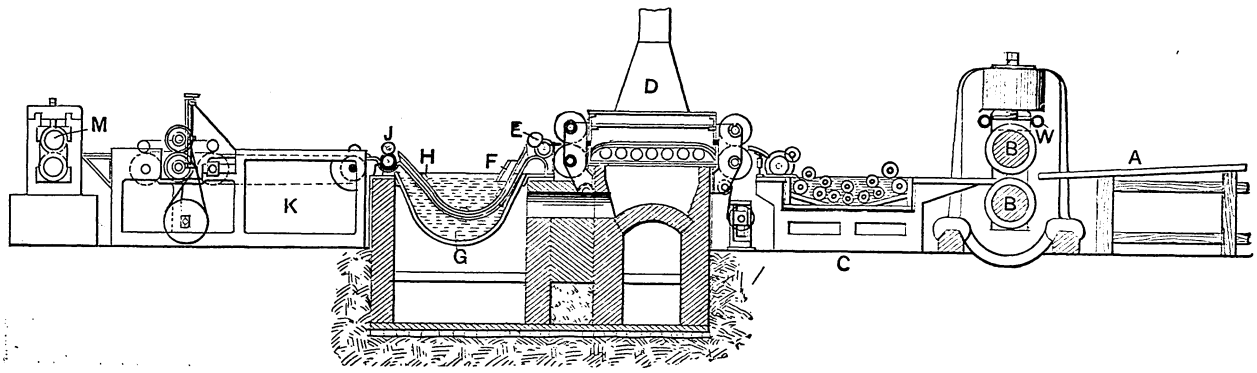

Fig. 1.—Elevation.

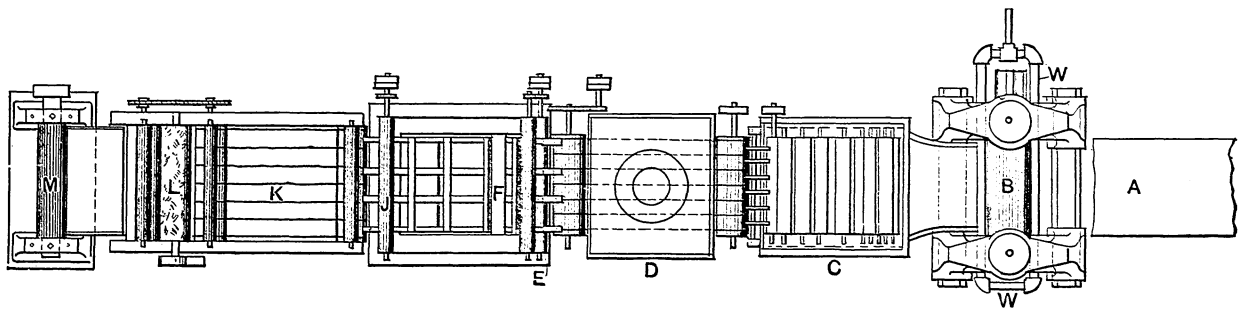

Fig. 2.—Plan.

THE SAGUE SHEET GALVANIZING MACHINE.

Hosted by Google

tending transversely of vat C are located a pair of suitable rolls adapted to receive the sheet from the rolls B, and the sides of the vat afford bearing for the trunnions of a series of guide rolls. At the delivering end of vat C are located suitable wringer or wiper rolls. The sheet is thus fed endwise through the muriatic acid bath between the upper and lower guide rolls to wringer or wiper rolls, whence the sheet or plate is fed between rolls to and through the drying chamber of a furnace, D. A pair of rolls is provided at the delivering end of the drying chamber of the furnace, from which the sheet passes to guide rolls E and is thence conducted through a suitable flux in box F into and through the zinc or spelter in the so-called "galvanizing" pot G. The sheet or plate is guided in its passage through the spelter bath by a pair of curved and parallel open frames, H.

Rolls, J, carry the sheet on to endless chains, K, that lead it to the brushing machine L, where the sheet is brushed clean. It is then fed to calendering rolls, M, that are adapted to smooth and finish the sheet or plate, and deliver it in proper condition for shipment.

The products of combustion from the furnace which is used to melt the zinc are conducted under the drying chamber, in order to utilize the waste heat.

WORLD'S FAIR NOTES.

Maris & Beckley

of Philadelphia exhibit at Column O 30 a hand traveling crane and Teal's portable hoists. The crane is mounted on a light frame of angle iron, which serves very well to show its special features. The hoists are shown in a variety of sizes, adapted to a wide range of work. The firm are manufacturers of power as well as hand traveling cranes.

The Andrews & Johnson Company

of 241 to 247 South Jefferson street, Chicago, have an interesting exhibit of ventilating apparatus at Column M 31. They manufacture not only fans and blowers, but also the Johnson high speed engine, adapted especially for direct connection to these devices, although it can be used for other purposes. It is a double piston engine, the pistons being placed opposite each other on the crank shaft. The pistons and valve gear are inclosed so that the bearings run in oil and water. It has a somewhat singular appearance, with its horizontal projections on each side of the crank shaft, but it runs noiselessly, maintains a very high speed, is economical in the use of steam and is said to be capable of long service, provision being made for taking up wear. The exhaust is used to furnish warm water for the center bearings. A large number of disk fans are constantly in operation in this exhibit, showing many ways of applying them, as for instance in the ceiling, in the wall, in the side of a shaft and on the floor.

Hawley Down Draft Furnace Company

of Security Building, Chicago, at Column H 25, make a joint exhibit with John Mohr & Son, boiler manufacturers, whose works are at 32 to 42 Illinois street, Chicago, and Ninety-sixth street and Calumet river, South Chicago. A well finished flue boiler is shown, with brick work complete, except for a small portion of one side of the fire box, which permits an inspection of the method of fitting the Hawley smokeless furnace to the boiler. This furnace has an upper and lower fire chamber. The upper fire chamber, into which coal is shoveled, has grate bars of pipes inclined upward to the rear. These pipes are connected with the boiler to secure a circulation of water, which they assist in heating. The lower fire chamber is fitted with ordinary grate bars, and is connected under the boiler with the chimney. Partly consumed coal drops from the upper fire chamber to the lower, which soon becomes so hot that it burns all gases drawn downward from the fresh coal above, and thus prevents the formation of smoke by securing more perfect combustion than if the coal was burned by direct draft.

The H. C. Frick Coke Company

of Pittsburgh, Pa., make one of the most attractive and instructive exhibits in the east gallery of the Mines and Mining Building to be found at the exposition. It is, perhaps, as perfect a representation as can be made of the business of manufacturing coke aside from the actual work itself. In the foreground of the exhibit is a complete model of the coke ovens, hoisting works, engine house, &c., of the company's Standard mine. It is built on a large scale, and shows the network of railroad tracks running through the yards, with miniature cars standing on them, while the long double row of ovens looks remarkably true to life, with a gas jet at the top of each as though the ovens were being fired. A row of workmen's houses stands in the vicinity of the ovens. Fine coke has been strewn over the ground, giving it the natural appearance of coke yards. This model is built on a platform the sides of which are furnished with glass doors inclosing samples of large pieces of coke. In the rear of this splendid piece of work is a model of the Leisenring No. 2 shaft, with its double hoist in operation. It includes all the buildings, engine house, &c., which were built by the Keystone Bridge Company of Pittsburgh. The model is one-sixteenth of the actual size of the plant, and was made by the Jones Bros. Electric Company of Cincinnati. It is a piece of exquisite work. To the right of this model stands a huge pyramid of coke, 18 feet square at the base and extending to the roof of the gallery. It is built of large pieces of coke, and has on one side a tablet giving the daily capacity of Frick coke at 21,000 tons. Next comes a 34 bushel mine car built by Kenney & Co. of Scottdale, Pa., which is filled with "run of mine" Connellsville coal, and stands on a short piece of mine track. Beyond this is a long table on which is a train of five cars, perfect models of standard coke cars for the transportation of coke. They are filled with coke, and so faithfully are details carried out that each has on it a shipping tag. They stand on a complete track. Numerous photographic views of mine buildings are shown in frames revolving on a pedestal having a base of coke inclosed in glass. A large relief map is shown of the entire Connellsville region, giving the location of every mine and faithfully reproducing all the natural features. It is on a scale of 1200 feet to the inch, a horizontal scale of $\frac{1}{14400}$ of nature and a vertical scale of $\frac{1}{4800}$ of nature. It was modeled by Edward B. Harden of Philadelphia from the surveys of the H. C. Frick Coke Company, J. H. Paddock being chief engineer and Kenneth Allen engineer in charge. On the walls hang a large topographical map of the region on a scale of 1600 feet, a plan of the underground workings of the Leiseuring mine, &c. The company distribute as a souvenir a beautifully printed pamphlet, with photogravure illustrations, entitled, "Connellsville Coke." It gives a history of the development of the coke industry of the Connellsville region and shows the magnitude of the interests now involved.

The Rand Drill Company,

23 Park Place, New York, and 1327 Monadnock Building, Chicago, have two exhibits of a high order. One of these is located in Machinery Hall, in the engine section, and the other in the Mines Building, on the east side near the southeast entrance. The exhibit in Machinery Hall consists of a large compressor of a new and greatly improved type, having a number of interesting features. It is of the duplex pattern, and has a capacity of 2500 cubic feet of air per minute. It is provided with a compound condensing Corliss engine having an automatic pressure regulator to the cut off, and has compound air cylinders with an intermediate cooler between the cylinders, through which the air passes to become cooled by water preparatory to the second compression in the high pressure cylinders. The air cylinders are fitted with mechanical valves, which obviate the fluttering and chattering of the valves upon their seats and thereby give a full and unobstructed passage for the air both into and out of the air cylinder. The steam cylinders are 22 and 40 by 48 inches, while the air cylinders are 22 and 34 by 48. The engine is about 350 horsepower, and the machine is constantly at work under steam, supplying air to a system of piping through the fair grounds for use in operating air brakes, moving locomotives and hoisting elevators, thus supplying power in numerous locations where steam is not allowed or not available. It has done most excellent service during the entire term of the Fair, having proved itself to be thoroughly reliable, efficient and economical.

The exhibit in the Mines Building is of a more varied character, comprising air compressors, rock drills and other mining appliances. The air compressors shown here are of several classes. One is a 14 x 22-inch duplex, Class B. This is a standard machine, and is fitted with mechanical valves also. It represents a type of air compressors made by this company which will be found in world wide use. It is in regular operation, furnishing air to run the drills exhibited. Other compressors are the straight line 16 x 24, 12 x 16 and 8 x 12 Class C machines, a duplex 12 x 16 belt compressor and a 7 x 9 belt machine for pneumatic tube work in class D and a powerful three-stage vertical high pressure machine capable of compressing air or gases to 4000 pounds to the square inch. The drills comprise the Slugger, Little Giant, Kid and Acrobat rock drills and a blast furnace tapping drill. The Kid is a small drill for lightest work. The blast furnace tapping drill is one of the company's latest machines, and saves the labor of a large force of men in tapping a furnace. Among the notable mining appliances are Derby hollow drill bits, through which exhaust air is forced down to the face of the cutter, and the powdered stone is thus blown out of the hole as fast as it is cut,

Hosted by Google

which increases the cutting capacity of the bit by keeping a clean rock surface under the cutting tool. Various styles of tripods are shown, also drifting or tunnel columns, shaft and stoping bars, quarry bars, &c. A model is shown in a glass case of the first rock drill invented, in which the steel bit was made the extension of the piston rod. It was invented by J. W. Towle of Boston, in 1851, and covers the chief points in use to-day. There are few exhibits more attractive to miners than the fine display made by this company, whose compressors and drills are known all over the world wherever mining operations are conducted on a scale involving the use of machinery. The company's achievements have been recognized by the bestowal of ten awards, covering the large compressor in Machinery Hall, and the compressors, drills, furnace tapping drill, shaft bar, columns and Derby bit, as well as a separate award on the collective exhibit of compressors and drills in the Mines Building. The Chicago office of this company is under the direct charge of J. F. Lewis, than whom very few men are better known to or more highly esteemed by the mining fraternity.

Lidgerwood Mfg. Company

of New York and Chicago make an exhibit of hoisting machinery at Column F 28, Machinery Hall. Six different styles of engines are shown and two styles of mining hoists. One of the latter is a 50 horse-power friction drum reversible engine and the other is a 20 horse-power reversible engine. Among the engines is a 30 horse-power six spool erecting engine for use in bridge and large building erections. There is also a double friction drum 20 horse power contractors' hoist, with boiler complete. The others comprise a 12 horse power single friction down hoisting engine, and a 30 horse-power Locke-Miller cable way engine used in operating the Locke-Miller cable way, for open pit mining, canal excavation, dam building, &c. In the Electricity Building the company also show a 110 horse power mining hoist, run by a Thomson-Houston motor. The smallness of the space allotted prevented the company from exhibiting log skidding and stone quarry engines, rapid unloaders, &c. They manufacture in all 300 sizes and styles, but those exhibited are selected as fairly representative of their machines.

Fraser & Chalmers

of Chicago and London have a large exhibit of mining machinery in the Mines Building, in the southeast corner. One of the most interesting features of this exhibit is a huge Chilian mill, which consists of a pair of large rolls about 7½ feet in diameter and weighing 8½ tons each, moving at a speed of 14 revolutions per minute. These rolls revolve in a huge pan, not only turning on their own axis, but revolving in opposite directions. They grind 18 tons of rock to 160 mesh, or 24 tons to 80 mesh in 24 hours. Other appliances shown are a complete water jacketed lead furnace and improved stone breaker, Eckart's fine crushing rolls, Standard, Blake and Dodge crushers, a prospector's hoist, with a mining cage rigged and in full operation, the Bridgman sampling machine, revolving screens, a moving belt with small samples of perforated metal completely covering it, a retort and bullion furnace, grinder for preparing assay samples, a sectional mortar for muleback transportation, double discharge dry and wet crushing mortars, the Huntington roller quartz mill, improved frue vanners, a modern five-stamp quartz mill, making 90 drops per minute, with wearing parts of ferro-alumina, and one of the famous Riedler mining pumps, now used in so many deep mines. All this machinery is in order for operation, so that its action can be shown to those interested. The same firm have a 1000 horse-power Corliss quadruple expansion engine in active service in Machinery Hall.

The P. H. & F. M. Root Company

of Connersville, Ind., make a good display of pumping, blowing, ventilating and exhausting apparatus in the Mines Building. A peculiarity of this exhibit is that the same principle runs throughout their blowers, pumps and exhausting apparatus. Two revolving parts are inclosed in the body of the machine, so constructed that they keep up continuous contact with each other and with the case in which they are inclosed during their entire revolution, thus forcing forward and utilizing all the air or water taken into the case. The firm also make a water motor on the same plan. The principle is simple, but ingenious, and appears to be remarkably effective. A belt pump is shown, constructed in this way, having a capacity of 3850 gallons per minute. It is connected with a tank, from which it draws a supply and into which it discharges. This pump is meeting with special favor for irrigation purposes. One of them, at Grand Junction, Col., runs with an 87-inch turbine, the largest size made, and hoists water 180 feet high. It has a 24-inch nozzle and discharges 4000 gallons per minute. A positive high pressure blower is shown, with engine attached, which is capable of sustaining a pressure of 12 pounds to the square inch. Samples are exhibited of the new Acme portable forge for light, general and heavy smith work.

Fairbanks, Morse & Co.

of Lake and La Salle streets, Chicago, exhibit steam pumps and hoisting machinery in the Mines Building. Six pumps, a pump and receiver and two styles of hoising engines are shown. All are duplex pumps. The largest is a compound 8 x 12 x 12 inches. These pumps are manufactured by the firm in Beloit, Wis. The pumps shown are therefore of the firm's own patterns. They have been made for only a year, but are meeting with great success. They range from water works pumps down to small boiler feeders. Most of those exhibited are shown connected and in working order. The hoists have been made for several years. One shown is double and the other single. These hoists are in wide use in the mines of the West, and the specimens shown are of the general type.

Webster, Camp & Lane Machine Company

of Akron, Ohio, make an excellent exhibit in the Mines Building, which gives a fair idea of the company's products. They show a portable hoist with boiler complete, as well as a steel frame work to support the sheave for the rope. A miners' cage is in position, a hole having been cut in the floor to receive it. A double tail rope haulage engine is shown, having two drums. This is set up as if for regular work, the platform in the center between the cylinders being equipped with the levers, but it is not in operation. There is also a Corliss engine neatly mounted on foundations, so as to show its proportions and finish, but it is not connected for work.

The Ingersoll-Sergeant Drill Company,

Havemeyer Building, New York, and 100 West Washington street, Chicago, have two exhibits. The exhibit in Machinery Hall consists of one of their latest improved compound duplex piston inlet cold air compressors. The principal features of this compressor consist in the manner of receiving the free air into the cylinder through a tube (which acts also as a piston rod), creating a uniform draft of air in one direction only, this uniform movement giving a certain momentum to the air and causing it to fill the cylinder to its fullest extent at each end of the stroke. The air inlet valves are large metallic rings which open and close by the natural momentum caused by the movement of the piston, admitting of a large area of inlet, with but a small throw of the valve. The cooling is effected by means of a new form of water jacket, the construction of the air cylinder admitting of an unusually large cooling surface being presented to the compressed air, near the end of the stroke, when the air is hottest. Another important feature is the new unloading device, maintaining a uniform pressure in the receiver and a uniform speed of the engine by means of connections with a discharge valve on each end of the air cylinder, a weighted valve of the safety valve pattern connected with the receiver, and a balanced throttle valve in the steam pipe. This compressor is driven by a compound Corliss condensing engine of a little over 300 horse-power. The high pressure steam cylinder is 18 x 42 inches and the low pressure cylinder 34 x 42, while the air cylinders are 18¼ x 42. This compressor has been in constant use during the fair, furnishing power to exhibitors in the Transportation Building who could not use steam.

The exhibit of this company in the Mines Building consists of compressors, drills and quarrying and coal cutting machinery. A straight line compressor is operated for the purpose of furnishing power to the other machines. The bar channeler on exhibition, for quarry work, will drill a round hole or cut a smooth open channel and takes out every cubic foot of stone in a marketable shape without blasting. Fourteen hundred feet of channel per month has been cut with this machine, and it is feasible to make cuts to a depth of 10 feet. The Ingersoll steam channeler, the Ingersoll standard gadder and the Ingersoll-Sergeant quarry bar are also shown. The Sergeant drill is in operation and presents many new features; also their standard mining drill, mounted on column for drifting or general tunnel work. The coal mining machine made by this company is peculiarly adapted to mining small veins of coal. Being simple and light it may be used in any place where a miner can swing a pick, and is extensively used by the leading coal miners in this country. The Sergeant air head has proved a great attraction to mining men. By means of a cup leather in this head a piston packing is secured, replacing the glands and packing usually applied to rock drills. Their Crescent battery is a positive and reliable blasting machine and discharges a uniform current of electricity, not depending on the skill of the operator; requires no violence or rapid movement when making the blast; is not liable to break or get out of order, and is very

Hosted by Google

simple in construction. The Moran flexible steam joint is also shown. By using a combination of these joints iron pipe may be used to conduct steam or air to drills instead of hose. Awards were made both on the compressor shown in Machinery Hall and on the machines exhibited in the Mines Building. The Chicago agency of this company is with Parker, Melcher & Ingraham, Incorporated, 100 West Washington street.

Gates Iron Works

of Chicago exhibit in operation in the Mines Building one of their great rock breakers of the next to the largest size made. Its capacity is 150 tons per hour, breaking rock from 14 x 30 inches down to 2½ inches. They also show stone screening machinery in operation, for sizing stone for macadam roads. A large sized working model is shown of a macadam crushing plant, automatic throughout, for crushing, elevating, screening and distributing stone in bins. A set of Cornish rolls, a dry ore concentrator and an amalgamator are exhibited. The company manufacture a general line of mining machinery, but were not able to show as much as they desired, on account of the limited space allotted them.

James Leffel & Co.

of Springfield, Ohio, make an interesting exhibit of their turbine wheels in the Mines Building. Large ones are shown, indicating the sizes which are manufactured by the firm, while smaller ones are exhibited, beautifully finished in brass, with all parts complete. In connection with the turbines is shown a specimen of Leffel's small steam engines. It is set on the back of a return flue boiler, to which it is rigidly fastened ready for the usual belt connections. Thus the only floor space required is for the boiler.

R. McCully

of 1518 Spring Garden street, Philadelphia, exhibits the McCully rock and ore crusher in the Mines Building This is a gyratory crusher, which has its shaft and crusher head supported and adjusted from the top of the machine. It also has a marble bottom for detaching the shaft operating mechanism without dismantling the entire machine. A very large output is claimed for this machine with a comparatively small expenditure of power.

The Connersville Blower Company

of Connersville, Ind., exhibit in the Mines Building one of their cycloidal blowers, the invention of their engineer, John T. Wilkin. This blower is driven by a direct engine, and develops a positive pressure of very great force for the size of the machine shown. It is a rotary blower, of which the internal operating parts consist of two impellers shaped accurately on cycloidal lines. The box in which they are inclosed is internally in the form of an ellipse. The cycloidal impellers perfectly fit in the ends of the ellipse and in the corresponding parts of each other, so that there is no leakage of air but a positive pressure forward of the full supply entering the chamber. Gas exhausters, pumps, motors, &c., are to be built on this principle.

The MacKay Electric Reciprocating Tool Company

of 733 Exchange Building, Boston, exhibit in the Mines Building a full sized specimen of one of their electric drills, while a handsomely finished model of small size is shown at practical work drilling in rock. The company manufacture a full line of reciprocating tools operated by electricity for cutting, drilling, molding and carving all kinds of stone and for riveting and calking boilers and ships.

E. Moreau

exhibits in the Mines Building one of the Sterling-Moreau hand rock drills. These drills are intended to take the place of hammer and drill in ordinary mining. They are mounted on a tripod and operated by a double crank, so that a workman can use both hands or two men can work the machine and secure more power. It is a percussion drill with a pair of hammers, cam shaft and reciprocating springs. One size of machine only is built. It is claimed that with it one man can do as much work as three with hammers and drills in the usual way. The drill is shown in actual operation on hard rock. It will shortly be manufactured in Philadelphia, arrangements now being under way.

Borden & Selleck Company,

48 and 50 Lake street, Chicago, show in the Mines Building the Harrison soft coal conveyor, consisting of triangular vertical heater attached to an endless chain, working in a V-shaped trough. They also exhibit a double strand wrought chain bucket elevator, a single strand wrought chain bucket elevator, a Harrison conveyor and shaking screen, and a coal and slack scraper for yards and mines. The company are large manufacturers of conveyors for all classes of materials.

Nelsonville Foundry & Machine Company

of Nelsonville, Ohio, exhibit in operation a double tail rope haulage engine. The cylinders are 11 x 16 inches, are geared six to one and drive 5-foot drums holding 2½ miles of rope. The engine has a steam friction clutch and is reversible. The drums are independent, and one can be reversed without regard to the other. It is a very compact engine, and takes up remarkably little floor space. The cylinders are so placed as to bring the drums inside the front and back lines of the engine.

James H. Lancaster

of New York exhibits in the Mines Building a rock and ore crusher, breaking rocks from 13 x 8 to 2 inches, with a capacity of 7 tons per hour. This crusher has corrugated jaws. The motion is applied to the rocking jaw by a double cam, which works with hardly any friction and gives the precise movement needed.

S. J. Meeker

of Newark, N. J., makes a very interesting exhibit in the Mines Building of malleable and gray iron castings, from car couplers down to small parts of harness. The large samples are shown on the floor, while the smaller ones are fastened to show boards placed on the wall.

Cookson Mfg. Company

of Kansas City, Mo., exhibit in operation in the Mines Building, pumping very muddy water, the Cookson duplex steam pump. Its size is 14 x 10 x 10 inches, and it delivers a solid 6-inch stream of water. This pump has the Lewis rotary valve in both steam and water cylinders, rigidly connected on the same stem. There are no poppet or check valves, the movement of the valve being independent of the water pressure. The ports open gradually to the full capacity of the water cylinder and close in the same way. The pump is not only adapted to raising pure liquids, but is specially adapted to pumping sewage, muddy water, water soaked grain or other very heavy duty.

Sullivan Machinery Company

of Claremont, N. H., exhibit in the Mines Building a great variety of coal and stone cutting machinery. They also show a number of diamond core drills, capable of doing very heavy work. This exhibit is very comprehensive, taking in not only large steam drills but small hand drills for prospectors' use, capable of boring 300 feet.

The New Jersey Steel & Iron Company

of Trenton, N. J., exhibit in the northwest section of the annex to Transportation Building a revolving model of the center panel of the 356 foot 6-inch double track span of the Chicago, Burlington & Quincy Railroad bridge across the Mississippi River at Burlington, Iowa. The model is some 6 feet square and 8 feet high, constructed of small beams, channels, angles and tie rods, riveted and connected precisely like the bridge itself. It is mounted on a revolving table of the kind used for swinging bridges. A circular railing incloses this specimen of a bridge, and on it are hung samples of trace and other chains made by the company. On a display board at the side are tacked specimens of chains of numerous sizes and kinds, as well as sections of the beams and channels made by the company. On another part of the space is shown a model to one-fifth size of the superstructure of the Brooklyn Elevated Railroad. A full-sized section is shown of the top chords of four 440-foot double track spans of the St. L., K. & N. W. bridge now being erected over the Missouri River at Belle fontaine Bluff, Mo. Immediately adjoining this exhibit is that of

The Trenton Iron Company

of Trenton, N. J., whose display is largely of wire rope, even the ornamental railing in front being formed of such rope, arranged in decorative patterns. Two pyramids formed of coils of wire rope, properly braced, are used as posts to support a rope tramway, on which is shown a patent cable hoist carriage having a carrying capacity of 1 ton. There is also shown a 20-ton block for a cable hoist, of the kind used at Glen Union, Pa., where an extensive rope tramway system is in regular use. Nearby is a new patent dump car composed wholly of iron and steel, known as the Weber dumping car. It has a capacity of 2800 pounds, hangs on pivots, and is emptied by a crank at the end, which works in cogs, carrying the car just off the center, when it dumps out the entire load sideways. Some of the cars and part of the track system of the Bleichert overhead tramway are also exhibited here. A number of nicely arranged showboards give specimens of hoisting rope, Tiller, Lang, Lay and standard galvanized and transmission rope, patent locked wire rope in smooth coil, interlocking and locked wire hoisting rope, patent tramway couplings and lugs, patent tramway parts, such as anchorages, bolt sockets, &c., specimens of reduction in rolling from a 4-inch billet to No. 4½ rod and 1 inch flat, reduction in drawing wire by the different stages from ⅝ inch to No. 44, wire specialties in tempered cast

Hosted by Google

steel, such as spiral coil and flat springs, coils of coppered iron wire, tinned iron wire, galvanized spiral ribbon, and tele graph wire. Tests are shown of the comparative strength of iron and steel wires, by weights suspended from a beam by a specimen of each kind of wire. A reel of patent locked wire rope is shown, 3400 feet long and 1¼ inches in diameter, which has been in continuous service day and night for 24 months hoisting loads of 6½ tons at a speed of 3000 feet per minute at the Central Copper Mine. It is in such condition that it will be put in service again immediately after the close of the exposition. Showcases contain samples of fine wires, such as are used for all kinds of musical instruments, book stitching, broom, bottling, tempered cast steel card wire and weaving wire. A coil of bright iron wire, No. 50, is shown weighing 11½ pounds, which measures over 3 miles in length. Two whip-like pieces are shown which are specimens of reduction in drawing wire from ⅝ rod to No. 36 wire, the intermediate reduction being shown in lengths of about 1 inch. An Acme patent tramway car is also shown, which is intended for use on overhead tramways, but also has wheels at the bottom to facilitate handling on the ground. It is made of iron and steel, holds half a ton and the bottom drops automatically.

The Trenton Iron Company have another exhibit which attracts a very great deal of attention in the shape of a completely equipped wire rope tramway operated on quite a large scale. It is located in the open air, running from the southwestern corner of the Mines Building to the Sixty-fourth street entrance to the grounds. It is used for transferring diamondiferous earth from the store yard on the grounds to the Mines Building, in which it passes to the crushers in the South African diamond exhibit. This tramway is built on the Bleichert system. As operated here it works backward, bringing material in toward the operating station instead of taking it out as usual, but works just as well under such conditions. This tramway has a total length of about 1000 feet and the ropes are supported on iron posts of lattice work. The posts are 15 to 20 feet high except at one place in passing over the intramural elevated railway, where they are about 40 feet high. Motive power is supplied to this plant by electricity. During the whole period of the fair there has been a constant stream of buckets passing back and forth over this tramway, automatically weighing and unloading themselves. The practical value of the system has thus been demonstrated in a much more effective way than by any other possible method. Inside of the Mines Building, under the floor, is shown a system of underground haulage by the same company. A passageway has been constructed which runs from one side of the building to the other. It resembles in every respect a passageway in a mine. The company's special styles of mine cars are shown, drawn by a steam tail rope Lidgerwood engine. At one place, under Fraser & Chalmers' exhibit, a mining cage comes down through the floor of the building to this railway. The company deserve and have received a great deal of credit for their enterprise in making such a complete exhibit of their products and devices.

F. C. Austin Mfg. Company

of Carpenter street and Carroll avenue, Chicago, exhibit a number of road making machines and other road and street devices in the northwest corner of the annex to the Transportation Building. The New Era grader and ditcher is the principal feature of the exhibit. It is intended to be drawn by a traction engine, but when that is not available 12 horses will be used. It can handle from 800 to 1000 cubic yards per day, which brings the cost of grading very low. One of them is now being used on the Chicago drainage canal, handling loose rock, with good results. It is, however, best adapted to making concrete roads. One will build 30 miles per day of good roads. It delivers the earth from 14 to 22 feet from the plow and at an extreme hight of 8 feet. The Austin rock crusher, for macadam and stone roads, is a portable crusher that can be put in position at any desired location and run by a portable engine or other source of power. Next comes the Austin reversible road machine, for building and repairing roads. Its steel scraper is mounted between the front and back wheels of the frame and is reversible. The Austin street sweeper shown is of very solid construction; it has a huge brush attached diagonally under the rear wheels, which revolves by gearing connected with the wheels and is thrown out or in by an easily operated double clutch, also being susceptible of elevation in passing over a large obstruction. A hand garbage cart for use in connection with street cleaning is shown. It is a metal can, pivoted in a frame supported on two wheels. The Austin reversible road roller is a huge machine weighing 5 tons, having a large circumference and ball bearings, so that it is drawn easily on a level by two horses. A dump wagon is also shown, which is a most convenient article for contractors' use. It has a steel lined body, and the interior is composed of a steel pan which holds the load. The pan is pivoted nearly in the center and is swung easily by the driver at the touch of a lever by his side. It is strongly built and is capable of very heavy work. A model is displayed of the Austin tubular truss bridge for highways. This is a new field into which the company have but recently gone. The bridge is remarkably strong and light, the main parts being composed of wrought iron pipe held together by the usual tie rods and turn buckles. It appears to be particularly adapted for the construction of moderately long spans for ordinary highways.

The Link-Belt Companies,

as they are called, are the Link-Belt Machinery Company of Chicago and the Link-Belt Engineering Company of New York and Philadelphia. They have a joint exhibit in the northeast section of the annex to Transportation Building. Here they have erected a great frame work in which they show in operation six styles of freight and coal handling machinery, conveyors, elevators, &c., all based on applications in some form of the link belt. These six styles shown are as follows: Horizontal box conveyor, horizontal and inclined coal conveyor, continuous bucket elevator, light package elevator, continuous freight elevator with an automatic discharge, and an automatic discharge barrel and sack elevator. They also show a system of manila rope power transmission, operating the entire exhibit. The power is taken from a 25-horse power motor, transmitted to a jack shaft and thence driven by a single manila rope.

San Francisco News.

The hardware and iron trades of this city State and Coast is gradually, slowly, but surely, undergoing radical changes. There have been whisperings of changes during the whole of the past year. This, that and the other house was going out of business. At one time it was rumored that three were going to drop out, and the air was thick with rumors as to the causes. It was said that they could not stand the competition of the East, which could undersell them even in their own markets, and that thus they had to go. The houses have not gone, but some of their proprietors have, some of the most notable men in the hardware trade having passed away forever from the busy scenes of trade and traffic during the past year. Both heads of the house of Baker & Hamilton have left the business, one of the finest in the country, to their successors, and now the heads of the old hose of Huntington, Hopkins & Co. are retiring. Albert Gallatin, the head of the house, and his partners retire with comfortable fortunes and leave the business to five of the leading employees, who will start out in business anew and on new lines. The statement in the local papers that the house was going out of business was entirely devoid of truth. The house was founded away back in 1849–50, in the City of Sacramento, by the gentlemen whose names it bears. The old head of the house, Mr. Huntington, is the only one that survives. It has a historic fame, as the partners were among the founders of the Transcontinental Railroad. But long ago they parted with their interests in the business, which meanwhile had been extended to San Francisco, and for many long years Mr. Gallatin was the head of it. During the year the Sacramento house was discontinued, or, rather, sold out to new men, and now the same thing has happened in regard to the San Francisco house. The railroad people had long ago ceased to have more than a nominal connection with it.

The importation by sea threatens to make an entire change in the currents of trade, as there has been a decided falling off in the importations by rail, and a still more decided increase in the importations by sea. This means that the greater part of the Coast will be supplied from this city as soon as there is any business of moment. The dull state of the general markets has had, of course, considerable to do with the falling off in rail receipts, but it is evident that the railroad will never again be the factor in the hardware and iron and steel trades that it has been in the past. When Oregon, Washington and Southern California have recovered from the effects of the recent financial troubles our San Francisco house will have a very good trade with them—a something which has not happened since the overland road was first opened.

There has been an improvement in the volume of trade during the past two weeks, though the improvement has not been great. The trade are disappointed at the ruling prices, the result of excessive competition, which really in many cases leave no margin of profit whatever. This may be expected to settle itself next year—not, however, before the end of the present season, as the stocks are large and were laid in some time ago. There is, therefore, little room for variation in prices, and in fact there has been none of any importance for some time past.

We have had very few arrivals of

Hosted by Google

nails during the fortnight, but there were 1215 kegs by sea. There are not much signs as yet of the rebuilding of the Oakland factory, and for months the trade will have to depend on hold over stocks and Eastern supplies.

We are obtaining considerable quantities of Eastern pig iron, the "Shenandoah" and the "Francis" arriving with 450 tons. The market is duller than anything ever on record in this city, the quotation being $18 to $19 per ton. There may be said to be no demand for English or Scotch at $22 to $23.

There have been no more importations of tin plate for the past two weeks and there does not need to be any for we have enough on hand at present for a five months' supply at the rate of consumption for 1893. There has been a slight appreciation in the market. Coke tin is quotable at $5.50, though the jobbing rate is $5.75. Pig tin is very dull at 22 cents.

Labor Troubles at Apollo, Pa.

During last week the Amalgamated Association of Iron & Steel Workers made two direct appeals to the public for sympathy in their disagreements with employers. The first appeal was made on behalf of puddlers, bar rollers and others at Pittsburgh, and the second was made in the interests of locked out sheet mill operatives at Apollo, Pa. In both cases the public were asked to lend their influence for the support of a body of organized workmen who have had steady employment for 12 years past and whose daily earnings up to July 1 this year averaged $3.75 per day, the minimum individual earnings being about $1.60 and the maximum $20 per day. Speeches were made at Apollo last Saturday which were worthy of some great national cause. Attempts were made to introduce patriotism into the questions under consideration, and the right of the Apollo Iron & Steel Company to protect their investment according to their best judgment was entirely ignored. They were told in effect that their desire to operate their works with workmen who were not members of any labor organization, but free and independent individuals selling their labor at a price and upon terms mutually agreed upon, was a direct request that their employees should waive their rights of citizenship.

The facts in the case are that some of the workmen of the Apollo Iron & Steel Company absolutely refused to abide by the provisions of the scale adopted in Pittsburgh in June last, and the Amalgamated Association not taking any action in the matter, the firm was finally compelled to start its plant nonunion. At this time eight mills are in operation, and as fast as the wants of their customers demand other portions of the plant will be started up. The firm have experienced but little difficulty in securing competent employees when needed. Realizing the success which was attending the company's efforts, a mass meeting was called and several thousand people listened to speeches made by officers of the Amalgamated Association, preachers and others, who had a direct or indirect interest in the struggle. The speeches were such as are usually heard at meetings of this description. Retail tradesmen were told that their interests were identical with the workmen's, and the conditions of the struggle were likened unto those that have passed into history as fights for personal liberty. So far as the direct question at issue was concerned—that of the company's right to make new agreements with its workmen individually, after it was known that the agreement made with the men collectively was not being strictly adhered to—nothing was said. Resolutions were passed condemning the action of the Apollo Iron & Steel Company, but so far as can be learned at this writing they will not change their course of action.

Photographing Colors.

On Wednesday week, says the *Engineer*, Leon Warnerke of Champion Hill, London, brought under the notice of the Congress of the Photographic Society at the Society of Arts an item not entered in the official programme. It related to the latest advances in real photography in natural colors. For some months past photographic circles in Paris, according to the French journals, have been delighted with the progress which Lumière et Cie. of Lyons have made with Professor Lippmann's process, and Mr. Warnerke was lent by that firm of dry plate makers about half a dozen of their photographs for exhibition in London for but three days, as they are in demand all over Europe among the scientific societies. The photographs themselves are 3 inches or 4 inches square, in a gelatino-bromide film on glass, and faced with a slightly wedge-shaped piece of glass, to throw aside reflexions not required when the pictures are exhibited on the screen by reflected light by means of the lantern. On the screen on Wednesday night the subjects resembled water or oil paintings, the iridescence being then quenched; their pictorial beauty exceeded all expectation. They were magnified to about 18 inches by 12 inches, and differed in nothing from colored works of art, but in the fact that gold, which was represented in one of the pictures, came out with something like metallic brilliancy; and that in another picture of the laboratory of a chemist, a pictured vessel containing a solution of fluorescine appeared almost fluorescent. The pictures were landscapes, portraits, and a photograph of a colored print.

The following are the main features of the process used by Auguste and Louis Lumière for taking the photographs exhibited. They make a fine almost transparent emulsion of bromide of silver, consisting of: A, distilled water, 400 grams; gelatine, 20 grams. B, distilled water, 25 grams; bromide of potassium, 2.3 grams. C, distilled water, 25 grams; nitrate of silver, 3 grams. To C half of A is added, and the other half of A to B. The two gelatinous solutions are then mixed by pouring that containing the silver into that containing the bromide. A color sensitiser, such as cyanine, methyl violet, or erythrosine, is then filtered, and the plates coated with exceedingly thin films by the aid of the whirling table, at a temperature not higher than 40° C. The plates are then soaked for a few seconds only in alcohol and dried. Before use they are immersed for a few minutes in distilled water, 200 grams; silver nitrate, 1 gram; glacial acetic acid, 1 gram, and dried; then at once exposed with the film in contact with a reflecting backing of mercury. Messrs. Lumière used the following developer: A, water, 100 parts; pyrogallol, 1 part. B, water, 100 parts; bromide of potassium, 1 part. C, ammonia, specific gravity, 0.960. From these solutions the developer was thus mixed: A, 10 volumes; B, 15 volumes; C, 5 volumes; water, 70 volumes. The developed plate was washed, fixed for 10 or 15 seconds in a 5 per cent. solution of cyanide of potassium and dried. During exposure a colored screen was used; one of them consisted of a solution of primuline in a glass trough with parallel sides. The amount of ammonia present has great influence on the results.

Messrs. Lumière stated to the Photographic Society of France that the foregoing formulæ differ little from those previously made known by M. Valenta of Vienna, whose formulæ in their turn differed little from some which Messrs. Lumière had published at Lyons still earlier. They claim that they get a finer grain in the emulsion than did M. Valenta, and in photographing interference phenomena approximate absence of grain is a vital point.

The chief difficulty with Professor Lippmann in trying to make his scientific discovery practical—work which he might better earlier have left to others—was the length of exposure. Messrs. Lumière et Cie. began with exposures of 40 minutes' duration, and at last, by experience, became able to reduce them to four minutes, no doubt using a portrait or some other lens which would give them abundance of light.

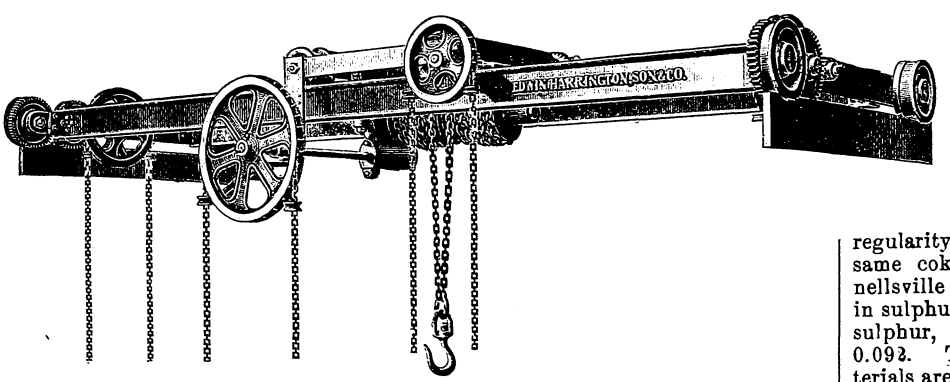
Treasury Decisions.

White Brass.

Before the U. S. General Appraisers at New York, October 14, 1893. In the matter of the protest, 19,129*b*–133, of Edw. A. Bigham, against the decision of the Collector of Customs at Boston, as to the rate and amount of duties chargeable on certain so-called white brass, imported per "British Empire," January 9, 1893. Opinion by Sharretts, General Appraiser.

The merchandise in question is metal in pigs. This metal is known as white brass, and is composed of 67 per cent. tin, 32 per cent. zinc, and a trace of copper. The appellant claims the merchandise should be classified under paragraph 736. The Collector assessed duty on the same at 45 per cent. ad valorem under paragraph 215. We cannot sustain the claim of the appellant.

We find on the face of the papers that the merchandise is something more than bar, block or pig tin, nor is it known as tin in pigs in trade and commerce. The board is in doubt whether metal of the kind in question in pigs, which is as crude a form as metal is usually imported into the United States, should be classified as metal unwrought under paragraph 202, or as a manufacture of metal under paragraph 215, but inasmuch as we are not called upon to decide this question, we overrule the protest and the Collector's decision stands.



A series of interesting experiments have recently been made at Marseilles, France, on board some tugs, with blocks of solidified petroleum made by a process invented by Lieutenant Maestracey of the French Navy. Weight for weight, it was found that the blocks gave three times the heat of ordinary coal, and it is thought that, with some simple modifications in the furnace, they can be made to yield four times the heat. The blocks, in addition, have no waste matter, and it is probable that measures can be adopted to suppress their smoke. It is certain, says *Le Génie Civil*, that solid or liquid petroleum is a combustible of the future which will be of prime importance in connection with steam vessels.

The Harrington Special Foundry Crane.

Edwin Harrington, Son & Co. (incorporated) of Philadelphia have designed a crane especially adapted for use in stove foundries and other places where fine work is required. For the lifting of copes or molds the ordinary chain and sprocket wheel hoist is claimed to be unsuitable, as, no matter how carefully it is made, a chain running over a sprocket wheel will, as each link leaves its pocket, jar the load, which generally results in a cracking of the sand and a breaking down of the mold.

This crane was designed with a view to obviate this difficulty. It will be noticed, by reference to the engraving, that the sprocket wheels of the hoist have been replaced by a drum having right and left spiral grooves, in order to insure the hanging of the hook continuously over the same point. A sure and steady movement, without jumping or jarring, is in this way secured, the chain winding and unwinding with the regularity of a rope on a windlass, and allowing a cope to be lifted and lowered without danger of the sand sifting out or the mold breaking down. The internal gears of the hoist are operated by means of a shaft extended far enough beyond the beam of the bridge to preveut the chain from interfering with the load; this also enables the operator to stand at a respectful distance from a pot of metal. The crane is operated by geared wheels throughout, and the shaft, which is placed inside of the beam to save room, moves the crane by pinions and intermediate gears, all of which are furnished with roller bearings, producing easy movement.

THE HARRINGTON SPECIAL FOUNDRY CRANE.

At Detroit last week bids were opened by the Board of Water Commissioners for 3500 tons of pipe ranging in size from 4 to 16 inches, inside diameter. The following bids had been presented: Lake Shore Foundry Company of Cleveland, $19 45 per ton, delivered in Detroit; Addyston Pipe & Steel Company of Cincinnati, $19.80 per ton, delivered; Dennis Long & Co. of Louisville, $20.39 per ton; Howard Harrison Company of Bessemer, Ala., 2000 tons at $19.20 and 1500 tons at $21.20.

The House of Representatives has passed a bill authorizing the President to make an international agreement with the governments interested in North Atlantic navigation, for reporting, marking and destroying dangerous wrecks, derelicts and other menaces to navigation on the seas outside the waters of the respective countries bordering on the Atlantic Ocean.

Progress in Foundry Practice.

Thomas D. West of Sharpsville, Pa, in the paper read before the Western Foundrymen's Association, discusses as follows some of the phases of progress in foundry practice:

With our present methods, one field now presenting itself for the acquisition of knowledge in matters of melting and cast iron is in the chemical action taking place in the remelting of iron. I have been greatly interested in the papers and discussions emanating from this organization upon the questions of chemistry, and think the subject of the utmost importance to many foundries. There are those that can get along without having chemical service, but they are very few who could not obtain practical benefit from a use of the knowledge now obtainable upon the question. I know that in the ingot department of our foundry we could not afford to abandon chemistry. Not only do we know the chemical qualities of every charge of iron that goes into our cupola, but also that of the coke. When running full our heats range from 50 to 70 tons per day, and the product is analyzed and a record kept, so that we are enabled to ascertain if anything is going wrong and chemically compute what goes in and what comes out of the cupola.

The adoption of chemistry in our foundry was not a question of choice. We were compelled from self defense to know what our product contained, as we found our customers often attributing short service in particular molds to excessive silicon or sulphur when it was plainly not due to these causes. To protect ourselves against claims of this nature, as well as to insure uniform analyses, we found it necessary to know not only the analysis of our pig iron, but also of our product. Comparison of analysis with service naturally followed, which in time resulted in a somewhat elaborate system of records. It might be advisable to state here that in our practice we use all pig iron, and that such practice gives an advantage for obtaining reliable data that foundries purchasing scrap to mix with pig metal could not secure as readily. Generally speaking, purchased scrap iron is a miscellaneous collection of everything, and to attempt to know its chemical composition would generally involve so much labor and expense as to make it impracticable. With some scrap piles, by taking several samples and mixing their drillings, so as to obtain an average, an analysis might often work very fairly, but such a case would be the exception to the rule. It would be best in such cases, when special results are desired, to abandon the use of scrap and use all pig iron.

The president of our company, Geo. H. Boyd, has formulated quite an elaborate system for recording the chemical and physical qualities of our iron and product coming from it. The way the subject is classified enables us to obtain some very valuable data. As an illustration we will take up the question of silicon and sulphur. Here we find, by remelting or by the action of the fuel and blast in the cupola, that we reduce the silicon from one tenth of 1 per cent. to four-tenths of 1 per cent., but this reduction is generally uniform. We think it is only through some radical change in manipulating the blast to the cupola it is caused to be reduced below two-tenths of 1 per cent. On the other hand, we increase the sulphur one time two-tenths of 1 per cent., and perhaps the next five-tenths of 1 per cent., when using coke of same analysis and in uniform ratio to iron charged. The manipulation of the cupola alone seems to affect the sulphur to a greater degree than the silicon, for the silicon is generally reduced uniformly, while the sulphur seems to have no regularity about its increase; and I am inclined to think the varying temperature existing at time of melting is the main cause of the irregularity found in the sulphur when same coke is being used. The Connellsville coke we use will average 0 80 in sulphur; the iron 1.50 silicon, 0.040 sulphur, manganese 0.34, phosphorus 0.093. The analyses of the above materials are given so as to enable any one that might be inclined to do so to take the matter up and compare notes with us.

There is a large field for investigation in chemical matters for the founder to explore, and the information to be obtained will enlighten us upon many mysteries we now find ourselves at a loss to fathom. I do not wish it understood that we are wholly relying upon the chemical analysis of iron, for there is too much to be discovered in that line ere we can ignore the physical qualities of iron in judging of and attaining results. While cupola work is progressing in respect to chemistry, I think from my late efforts and results there will be further achievements in melting barring what might come from the little explored region of electricity.

An investigation of the experiments made in cupolas with a view to economy in fuel shows that there have been many failures and we find almost all plans imaginable have been tried. Europe far surpasses this country in originality and novelty of designs, but I question if America has not excelled in the points of good general utility. The first radical benefical step we find to have been taken is in the adoption of the "drop bottom," an American invention. Ere this came in use bottoms were composed of solid masonry or fire proof material from the ground up to the spout and in order to get the "dump" or refuse out of the cupola after a heat was finished the "front breast," being made large, would be knocked out and by means of pokers the refuse and cleanings would be raked out. I am led to believe that this plan

Hosted by Google

is still being used in some parts of Europe. From the adoption of the "drop bottom," improvements have been mainly in the line of securing greater economy in the use of fuel. The most radical divergence from the common cupola has been caused by experiments in designs arranged as in the Woodward cupola, which sought to create a blast economically by means of a steam jet blowing up the stack; also as in the Krigar cupola, which instead of forcing the blast upward reversed the order; then, again, as in cupolas arranged to utilize gas for a fuel. In examining some of the cupolas that have been tried one would surely think that if crooks and oddity had any virtue, perfect combustion would have been accomplished long ago. This may be secured, but we find more founders have faith in the common cupola. My definition of common cupola is one of plain cylindrical form having one or more rows of tuyeres. The question of inside formation and illogical shapes given to cupolas have about ran their course of absurdity and this has been helped by late literature upon melting. We are rapidly advancing in understanding the principles and sciences involved in the proper construction of cupolas and melting, and to-day we find the only element of any value that has been grasped from out the chaos of ruined expectations in the construction of cupolas is that of economical combustion being attained by two or more rows of tuyeres. In order that all may be able to follow this paper intelligently and understand the philosophy and advantages to be gained by "upper tuyeres" we will first note the action of fuels in order to obtain perfect combustion. "According to Dulong 1 pound of carbon combining with the necessary quantity of oxygen to form carbonic acid develops 12,906 units of heat. The specific heat of cast being about 13, the melting point 2190°, and the coke containing 82 per cent. of carbon, then to heat a ton of cast of a temperature of, say, 40° to a temperature of 2190° would require $\frac{2150 \times 2240 \times 0.13}{12906 \times 0.82} = 59.1$ pounds coke. This is supposing that the whole of the carbon is converted into carbonic acid, but if by any means carbonic oxide is formed a very different result is obtained; then 1 pound of carbon to carbon oxide only evolves 4453 units of heat. If, however, by admitting air above the zone where the oxide is formed we recover 4478 units, this plus 4453 gives 8931, which is a little over two-thirds of the available heat to be gotten out of 1 pound of carbon. Allowing 10 per cent. for moisture in the coke, 10 per cent. for radiation and 20 per cent. for loss of heat passing off at the top of the cupola, or 40 per cent. in all, the amount of coke per ton of metal should not exceed 112 pounds, although the actual consumption is, as we have shown, usually much higher."

The combination of carbon with oxygen or air blown through the "lower tuyeres" produces carbonic acid gas in the bottom bed of fuel and this in passing up through fuel heated to incandescence takes up more carbon and is converted into carbonic oxide gas. Now, if the carbonic oxide can again have sufficient oxygen or air admitted to it we will again have carbonic acid, or more nearly complete combustion, and by such alternate zones, which at every repetition become less volient, we could, if it were only practical to hit the right spot of the descending stock with the proper amount of air, almost achieve the theoretical figure of melting 1 ton of iron with 59 pounds of fuel, as given in above table; but instead of that we consider if we can accomplish such with 200 pounds of fuel we are doing exceptionally good work.

We have cupolas figured to achieve the above results by combination in tuyeres and in reality cupolas having two or more rows of tuyeres can be the only ones properly entitled to the claim of being scientifically constructed as far as the admission of blast is concerned. Were it only possible for the blast passing through their tuyeres to penetrate to the center of the cupola and have an immovable zone of fuel to play into, they might successfully accomplish the end intended, but as it is the results are but partial. It is a question if the extra burning out of the lining which two or more rows of tuyeres cause by having more melting zones does not often more than compensate for what saving in fuel may be acquired.

Power House Engines for Electric Railways.

Concerning power house engines for electric railways the most essential points—as pointed out in a report submitted by E. G. Connette to the American Street Railway Association in convention at Milwaukee—to be considered are: 1. Perfect regulation. 2. Highest economy. 3. Greatest durability. 4. Division of power into units.

On an electric railway the variation of load amounts to a very considerable fraction of the whole maximum load; in small plants it may be 95 per cent. of the maximum, and in large plants it is frequently 50 per cent. The governor should be so constructed as to control the engine under any variations of load, with a variation of speed not to exceed 2 per cent.; be easy of access to all its parts and capable of being oiled while the engine is running. The cut off must be larger than in engines for less variable load and should be easily regulated between the limits of one-tenth and seven-tenths of the stroke. The severe conditions of high speed and sudden and extreme variations of load make it especially important that the engine have the best possible construction, with extra weight in the fly wheel and bed plate, and that the foundation be more than usually substantial, and also that the engine be placed in the hands of a competent engineer.

In order to obtain the highest economy in operation the engine should be properly adjusted to its load. Underloading or overloading is undesirable, though the compound condensing engines of the largest stations will stand underloading better than the simple high speed engine. Careful attention should be given to the setting of the valves so that the cut off will be the same at both ends of the cylinder. The report refers to the steam turbine and mentions that the Parsons has developed power at the rate of $20\frac{3}{10}$ pounds of water per electrical horse-power per hour. This is a strong rival to the reciprocating engine as a steam motor for electric power and light stations.

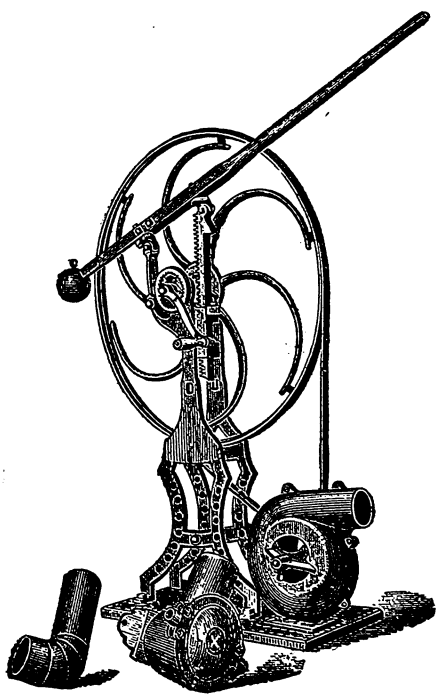
The boiler plant should have ample capacity, as there are few cases where the draft and setting are so excellent as to allow heavy forcing without a serious loss of economy. A good plan to encourage economy in the use of fuel on the part of the fireman is to pay him a coal premium at the end of each month, basing the amount of the premium paid on the average number of bushels of coal consumed each day during the month for a certain number of cars run. When the plant is of such size as to require more than two firemen, it will always be good economy to employ mechanical stokers.

The report cites the test of the Twin City Rapid Transit Company of Minneapolis and St. Paul. On the comparative value of the two fuels, coal and oil, this test showed that with the ordinary Lima oil weighing $6\frac{6}{10}$ pounds per gallon and costing $2\frac{1}{4}$ cents per gallon, and coal that gave an evaporation of $7\frac{1}{2}$ pounds of water per pound of coal, the two fuels were equally economical when the price of coal was $3 85 per ton of 2000 pounds. With the same coal at $2 per ton the coal was 37 per cent. more economical, and with the coal at $4.85 per ton the coal was 20 per cent. more expensive than the oil. These results include the difference in the cost of handling the coal, ashes and oil.

Local surroundings and conditions will, to some extent, govern the division of power into units, but, as a rule, the following principle will be safe to follow: The size of the proper unit of subdivision should be such as to give the required relay or reserve above the maximum power adopted. This will apply equally to boilers, engines and dynamos. The following table will serve to show approximately the proper proportion:

Maximum horse-power required to operate road.	Number of engines required,	Horse-power of each engine.
200	2	200
400	3	200
600	3	300
1,000	3	500
1,500	4	500
2,000	4	750

It will be observed from the above table that enough engines are provided to furnish the maximum horse-power required to operate a road and have a surplus of one engine. This is very essential, as it enables the engineer to keep his engines in perfect adjustment and repair, having at all times an extra engine to work on, or, in case of breakdown, the extra engine is ready to take the place of the disabled one. The "maximum horse-power required to operate the road," referred to in this table, is not to be taken as the sum of the power needed by each car in service, except in case of small installations, since the maximum power required does not increase in proportion to the number of cars in use, since the line losses are not materially increased with increased traffic, and because, as the number of cars increases, the fluctuations of load tend to balance themselves and to reduce the maximum load nearer to the average load. Thus in a ten car plant, cases will occasionally occur when all of the cars will require their full power at the same time, and the power plant must be planned accordingly, and there is no probability that all of the cars of a 100-car plant will all require their full power at the same time; from 60 to 75 per cent. of this power, depending upon local conditions, will be sufficient for this plant.



In selecting a type of engine, the size of the installation must largely govern, as well as local conditions, such as water supply and price of fuel, though some consideration may be given to opportunities for station room and arrangement. For small plants to run 10 or 15 cars, simple high speed engines, belted direct to generators, are unques-

Hosted by Google

tionably the proper choice. For 20 to 50 car plants, compound engines, with condensing apparatus where it is possible; with tandem compound engines for the smaller plants and cross compound engines for the larger ones, geared direct to generator, will probably be found most economical. While for the larger systems compound or triple expansion condensing engines, using steam at a high initial pressure and either driving a countershaft or coupled direct to generator, whichever the conditions of the case will warrant, will be found a proper selection. In every case, except for small plants, where engines are belted direct to generator, the vertical type of engine is recommended.

The Tornado Fan Blower.

This blower, which is made by J. G. Hoffman of 4937 Forrestville avenue, Chicago, can be operated by either

The Tornado Fan Blower.

crank or lever, as each works independently of the other. The fan proper is of cast iron, while the fan shaft is cold rolled machinery steel. This shaft runs on centers, which can be adjusted as may be necessary. The steel crank shaft is mounted in cast iron bearings. The crank hangs loosely on the shaft with which it is brought in connection, when turned, by a simple arrangement of pawl and ratchet wheel. Provision is also made for operating the fan by means of the lever shown, which connects with the shaft by a ratchet wheel and pawls. All the parts of these blowers are made on the interchangeable plan.

The London *Ironmonger* reports that the Thomas basic patent, which is owned by two concerns in Germany—viz., the Hoerde Verein and the Rheinische Steel Works—will expire in April next, and thereafter these two companies, which have for some years past received considerable sums from other ironmasters for the right to use the process, will be deprived of an important source of revenue. The Hoerde Works will endeavor to find compensation by granting licenses for the desulphurizing patent, which belongs to them exclusively, but the Rheinische Works have no such resource available. During the last financial year the Hoerde Company are stated to have received in payments from German firms on account of the Thomas process 211,487 marks, against 87,992 marks in the previous year, while the Rheinische Works netted 238,344 marks, against 123,637 marks. As the Thomas patent expires at the same time in Austria-Hungary, the Hoerde Company will also lose their royalty rights in those countries, the amount received therefrom for the past year being reckoned at about 137,000 marks.

Use of Storage Batteries in Electric Generating Stations.

At the recent meeting of the American Street Railway Association in Milwaukee, C. O. Mailloux presented a valuable report on the use of storage batteries in electric generating stations for utilizing and regulating power. In this report the author uses the term "variation" to designate the effect caused on the station plant by putting on or taking off a certain number of cars, and the term "fluctuation" to designate those incessant and erratic ebbs and flows of current which are so familiar to us all, due to the starting and stopping of cars, changes of speed, grades, &c. It is for the purpose of better utilizing and economizing this power that the storage battery is proposed to be used, by taking advantage of its property of being able to give and take energy, and thus keep the load balanced and equalized at all times.

The author illustrated by curves the performance of the storage batteries placed in the Edison station in Fifty-third street, New York. Their chief function is to relieve the other stations at the hours of heavy load, by delivering into the mains a certain amount of current that would otherwise have to come, and at greater loss or "drop," from one or another of the stations connecting with the network of mains. Hence the load may be varied more or less arbitrarily at these stations according to the proportion of load that the larger stations are desired or able to carry.

The battery is installed on the second floor above the engine and dynamo room, and consists of 140 cells each of about 1000 ampère hour capacity, weighing some 750 pounds, and of about 48 inches in length, 21 inches in width and 15 inches in depth. The battery has a normal discharge rate of about 200 ampères, but can be discharged, if necessary, at 500 ampères.

The first curve, giving the record for April 22, 1893, was taken when the station was running only 12 hours per day, from noon to midnight. Calculation shows that the battery furnished about 23.2 per cent. of the total energy delivered to the mains. The maximum rate of discharge attained by the battery was about 270 ampères. Thus, in this case, we have an example of a battery which is used for the purpose: 1. Of giving a load to station machinery that would otherwise be idle. 2. Utilizing the stored energy to increase the rate of output of the station at the time of heavy load, which would otherwise necessitate greater dynamo capacity. In the second curve, taken five months later, the conditions have been changed. In the first place the station output has increased greatly, being now about 2.9 times greater, and it is also continuous. The next station now runs from 8 a.m. one day to about 2 a.m. the next day, or 18 hours. When it starts at 8 a.m. it carries a twofold load: 1, the regular load allotted to this station, and, 2, in addition thereto, the current absorbed by the batteries in charging. The total load is much more uniform than if the station were feeding into the mains alone, for the extremes of current fluctuations represent a total variation of only 80 ampères on an average load of 850, or less than 9½ per cent. The battery is now being made to play an additional part of some interest. The maximum load has increased to such a point that the station plant is no longer adequate; and consequently the battery is put on to "cap" the summit of the load and supply the excess for current required above the capacity of the dynamos. When the load begins to fall off (about midnight) a part of the plant is shut down; but since the load is still too heavy for the other dynamos, the batteries again serve to supply the excess.

In Europe great headway has been made in this branch. In London eight stations, aggregating 200,000 lights, are provided with storage batteries, the batteries in some instances being situated in substations. In Paris there are nearly 30 such substations, all charged from the same central station. In the "Edison sector" of the city an interesting application is made of a large (2800 ampère hours) battery, which is located at a point somewhat distant from the central station, and connected with the mains from which it is charged at those hours when the load is light by taking current from the mains themselves, the potential being regulated by means of a continuous current transformer. Thus the battery in this case saves the cost of larger feeders, while it also furnishes a load for the hours of small load.

This plan suggests itself as of possible service in electric railway systems covering a large area of territory all fed from a single central station. The batteries could be located at distant points, or at such points as would give the best distribution of current to the trolley lines with the least expensive line work. The station machinery would then virtually work at constant load to feed the batteries, which latter would supply the power needed for the car motors. In this way not only would an economy in the cost of conductors be effected, but there would be more uniformity of potential all over the system.

As regards the batteries used the author stated that the principal object to be aimed at was long life and high efficiency, even at the expense of increased first cost. The Planté process of formation and its modifications would seem to have proven itself superior to the pasting or Faure process, if one can make a criterion of the fact that at least nine-tenths of the aggregate of the central station batteries used are of the Planté type or some modification thereof. The Planté batteries are conceded to be, usually, of lower capacity per pound, but on the other hand they have the advantage of being able to carry heavier rates of charge or discharge.

A commission, appointed by Secretary Herbert, has proceeded to New Orleans to make a survey of the site for a proposed naval dry dock in or near that city.

Washington News.

(*From our Special Correspondent.*)

WASHINGTON, D. C., October 31, 1893.

The annual summing up of the operations of the Naval Steel Inspection Board, composed of Capt. J. A. Howel, Chief Engineer David Smith and Lieut.-Commander J. G. Eaton, shows the most flattering results in the matter of tests at the place of manufacture.

Lieutenant-Commander Eaton remarked:

"At first manufacturers complained of the severity of these tests, and they did find some difficulty in complying with the Government requirements. At first the rejections were up to 80 and 90 per cent.; now they range from but 1 to 5 per cent. There are some differences in the product of different establishments, affected, however, more by fuel or impurities of the oil. Some firms try to work in cheaper ores, others use pure ores and are invariably up to the requirements. The manufacturers are now satisfied with the wisdom of the schedule of tests laid down and of the steady improvement of their product in consequence of being kept up to the specifications."

Chief Engineer Smith and Lieutenant-Commander Eaton agreed that there might be some trouble at first in working the bolt holes of armor plates first and tempering afterward on account of expansion. Although this difficulty has been in a great measure overcome, it is now found practically impossible to work the plates for fastening after they have been tempered.

The tests of armor plates at Indian Head were not under the Steel Inspection Board, but under the Bureau of Ordnance. The results have, however, in every case sustained the care and accuracy of the tests at the place of manufacture by the inspection officers of the Steel Inspection Board.

The assertion of Chairman Wilson of the Committee of Ways and Means that he would be prepared to report the tariff revision bill by November 1 is amended by him in conversation to-day on the subject.

It is more likely to be ready in December or January than November, and if it were practicable to get out of the dilemma in some satisfactory way it is evident that some of the former revision members would not seriously antagonize a withholding of the subject until a more auspicious period of industrial energy and business activity.

The majority on the committee in some cases have been receiving some very plain letters from constituents whose opinions they are disposed to regard. These have infused a more conservative spirit among them than exists among their colleagues representing districts with few industries and those unimportant.

The silver question in the Senate has so overshadowed all other public questions that the tariff situation has been lost sight of in a measure. But now that the end of the silver discussion has been reached they intend to work under forced draft and get the bill before the House as soon as practicable. Chairman Wilson admits that the committee are not going ahead as rapidly as they had planned owing to the written protests which are being filed. They still adhere to the free raw material theory, with coal and iron ore prominent on the late proposed free list, and a 25 to 30 per cent. horizontal reduction on all other articles. For the purpose of raising revenue as a substitute for reductions or loss in the customs the Subcommittee on Internal Revenue are working on a graduated income tax and an increase in the internal tax on malt liquors and spirits. This has been practically agreed to. It is expected that the last two items will afford increased revenue enough to warrant a very radical revision of the rates on customs. It is also expected that the reduction of the rates on pig iron, steel rails and all other metallurgical products, as well as other manufactures, will still further increase the revenues through enlarged importations.

Chairman Wilson of the Committee on Ways and Means, speaking about the statements having their orbit in the press concerning the tariff revision bill, said to the correspondent of *The Iron Age* to-day:

"It is safe to say that you can put down ninety-nine out of every hundred assertions about our work in committee as the merest guesses and untrue. The sub-committees are at work and are making progress slowly. We do not expect to have the bill before the whole committee for quite a while, and when it gets there it may be a little while before it gets to the House. That will depend, of course, upon how far the minority members of the committee may wish to go into details. If they simply record their opposition in gross to the whole bill and make a minority report, that will not take much time, but it looks now as if it would be some time before the bill reaches the House. I cannot say how long, as such matters are subject to many contingencies.

"I have not received any letter from Mr. Carnegie, nor has any member of the committee so far as I am aware. The metal schedule is not being adjusted in rates to his views nor to these of any one else except the members of the subcommittee at present. They are giving this, as all other schedules, careful investigation, but no definite conclusions have been reached. The fixing of tariff rates should be a matter of careful adjustment, so that all parts shall bear a relation to each other and be harmonious.

"It was known at the time that during the arrangement of the present tariff act of 1890 Mr. Carnegie got the credit of having made some statements which, as a manufacturer, did not harmonize with the claims of his contemporaries in certain branches of metallurgical industries. It was alleged that he said to a certain member of the committee of that day that steel rails could stand a reduction of duties to $5 a ton, and that $8 would be fair. That gentleman, a Republican who was credited with having obtained that information and communicated it to his colleagues, is on the present committee. If it is stated that I have a letter from Mr. Carnegie on that subject I have not seen it. We intend to deal fairly with all branches of industry."

The following important interview took place between a prominent member of the majority of the Committee on Ways and Means and the correspondent of *The Iron Age:*

"The two articles, coal and iron ore, will be placed on the free list. I do not see how we can do otherwise. One of the cardinal features of the tariff revision is free raw material, and those two items are prominent in that catagory. I believe it will be done by a strict party vote in committee."

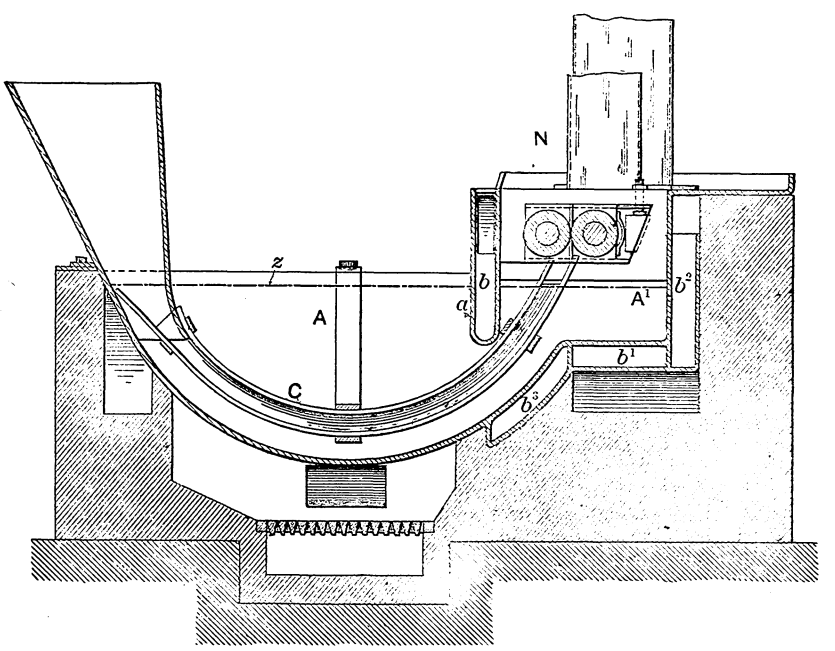
It is known that the subject has already been talked over and that is the drift of opinion. In reference to the prospect in the House it was replied:

"I think when these items on the free list get into the House they will give rise to a bitter contest. It would be difficult to give the result in advance of a canvass with the bill before the House, but in a general way it might be anticipated that States like Virginia, West Virginia, Georgia, Alabama and Tennessee would have a strong influence upon the action of members from the Southern States. The contest would be to strike coal and iron ore from the free list. On a full vote it would take a change of about 65 votes to defeat the committee's recommendation on these items. This is a large vote, but with the New England, Middle States and some of the Western with the Southern States directly interested, it could be done. The item of coal might stand, but it is very doubtful whether the committee can hold iron ore on the free list. This is a very widely spread industry and will find many champions on the floor of the House."

There is very little doubt that the committee will put these items on and it is equally apparent that they will not make a very desperate struggle to keep them there.

Engineer in Chief Melville has been more than gratified by the behavior of the engines on the "Columbia" during their recent preliminary trial. Between the lines while reading the report of the officers on board, he said, "$200,000 in Cramp's pocket, with a possible $250,000. I do not believe Cramp would take that for his chance. A speed of 21.8 knots without forcing makes her sure of 22 knots, with a possible 22¼ that will make the 'Columbia' the fleetest cruiser afloat.

"The 'Blenheim,'" added Chief Melville, "About the size of the 'New York,' claims 22 knots. The other British ship, the 'Blake,' claimed to be the fastest war ship on the ocean, has never run off her forced draft. She has only had her steam trial. We would now like to know what she can do under the highest conditions. I think when the official record is made the United States can claim in the 'Columbia' the fastest cruiser in the world.



"I think the eyes of the naval experts of the world will be centered upon the 'Columbia' when she starts on her official test of speed."

To promote the proper care of boilers when not in use the following order has been issued to the French Navy by the Government: On board all ships in the reserve, as well as those which are laid up, the boilers will be completely filled with fresh water; and this is to apply to shell boilers as well as to those of the tubulous or pipe type. In the case of large boilers with large tubes there will be added to the water a certain amount of milk of lime, following the instructions furnished by Belleville & Co. for the preservation of the tubes of their boilers, or a solution of soda may be used instead. In the case of tubulous boilers with small tubes milk of lime or soda may be added, but the solution will not be so strong as in the case of the larger tube, so as to avoid any danger of contracting the effective area by deposit from the solution; but the strength of the solution will be just sufficient to neutralize any acidity of the water.

The Jaques Tinning Pot.

We show in the accompanying engravings a new tinning pot for which a patent has just been granted to George W. Jaques of the firm of A. A. Thomson & Co. of New York City. Our section shows the position of the bath and the arrangement of the special feature of the pot, which is the air flue at the exit N. The object in the construction is to obtain two temperatures at the bath with one fire and to regulate the temperature of the metal under the grease pot. The great difficulty heretofore has been that plates in their continuous passage through the metal became so highly heated at the delivery end that they ignited the oil, while if two fires were used to regulate the temperature greater expense was involved. Another method of overcoming the difficulty, to which the patentee refers, is the passage of air currents about the cooling flues the air enters either through the flue in the chimney or into a separate uptake. The front flue b and back flue b^2 are connected by a cross flue; on the other side, where the uptake is situated, the several flues b, b^3, b^1 and b^2 open into a cross flue, which forms the enlarged base of the uptake. The arrangement is such that the air may be allowed to flow through any one or more flues, and may be regulated by register slides, thus controlling the temperature of the metal and oil within the inclosure A^1 and keeping it normally below the temperature of the main portion of the bath instead of permitting the oil and metal to become gradually hotter from the passage of the hot plates.

THE JAQUES TINNING POT.

the grease. A is the main portion of the bath with the furnace under it. The sheets are fed at the left hand and delivered at the right hand, being guided along the bottom of the bath by the guides C. They are drawn out through the grease through rollers. At the delivery end is an inclosure, A^1, the side A of which dips down into the metal in the bath, thus cutting off from the main bath a portion, within which inclosure the oil rests on the molten metal. The dotted line z shows the usual level of the metal in the bath, the oil level being at about the axes of the rollers. A special feature of this apparatus is the control of the temperature within the grease pot A^1, maintaining it lower than the main body of the pot by means of air flues. The walls and bottom of the inclosure A^1 are made double, so as to leave flues around the inclosed metal and oil through which the air may be made to circulate. In the illustration four flues are shown, b, b^3, b^1, b^2. The flue b^3 is under the curved portion of the bottom of the bath, the flue b^1 is under the flat portion or shelf of the bottom of the inclosure A^1, and the flue b^2 is in the wall opposite A. After circulating through

---

The Chicago, Milwaukee & St. Paul Railroad is now testing a 12-wheel passenger engine recently built under a guarantee by the Rhode Island Locomotive Works of Providence. Although in all there are 12 wheels, the machine is of ten-wheel type, six of these being drivers of unusual size for this class of locomotives—6 feet 6 inches in diameter. The total length of engine and tender is over 63 feet, the wheel base is 50 feet 6¾ inches, the driving wheel base is 13½ feet, the total weight in working order is 150,000 pounds; the weight of the tender is 75,000 pounds, the weight on the drivers is 90,000 pounds, the cylinders are 21 and 31 inches in diameter by 26 inches stroke, the heating surface covers 1788 square feet, the steel boiler has 272 tubes, the fuel capacity of the tender is 6 tons and the tank holds 4000 gallons.

The Bethlehem Iron Company, Bethlehem, Pa., have shipped a conning tower weighing 17 tons to the Norfolk Navy Yard for the gunboat "Amphitrite."

James A. Potter, late of the Potter & Atherton Machine Company, Pawtucket, R. I., has sailed for England, where he will enter into business in Accrington.

Speed Premium for War Vessels.

Although the Government has been compelled to pay vast sums as premiums to vessels that exceeded the requirements called for by the specifications, the policy of offering prizes has been wise. In addition, in more than one case the premiums obtained by the vessels have permitted the builder to make a profit, whereas, at the contract price and without the premium he would have to shoulder a loss. In the early stages of the building of the present navy bidders were inexperienced and in some cases were not perfectly equipped for doing the work. Without the premiums they would therefore have lost on the job.

In earlier years, when horse-power was paid for instead of speed, the "Yorktown," at $100 per unit of excess, earned $39,825, while the "Baltimore" gained what was then considered the magnificent sum of $106,441.80 by an excess of 1064.418 horse power. The "Newark," on a similar reckoning, earned $36,857.70 as her premium. The "Philadelphia" was built on the speed basis, under a guarantee of 19 knots, with an allowance of $50,000 for every additional quarter, and made 19.678 on her trial trip, thus receiving $100,000 extra, the Government not allowing premiums or exacting penalties for fractions of a quarter knot. The "San Francisco," on the Pacific Coast, was another great premium winner. The gunboat "Concord" earned only $453 premium, her horse-power in excess of the contract being but 4.53; but her sister ship, the "Bennington," had an excess of 36 horse-power, and so earned about $3600. The "New York," on an allowance of $50,000 per quarter knot, made $200,000 extra. The "Detroit," with $25,000 per quarter knot, made six and nearly seven additional quarters, as has been said, and earned $150,000.

The "Montgomery" and "Marblehead," two sister ships of the "Detroit," are expected to do as well, making $300,000 for the pair. The "Olympia," on the Pacific Coast, counts on a big premium, and the "Castine" has already beaten the preliminary trip of the "Machias," her sister ship, which was a premium winner. The "Columbia" alone is expected to win at least $200,000, and will only have to show a knot above the contract to get it. A knot and a quarter will earn $250,000.

There are, on the other hand, penalties for shortcomings exactly equal to the premiums offered. Thus the "Charleston," which was guaranteed to produce 7000 horse-power, reached only 6666, so incurring a loss, at $100 per unit, of nearly $33,400. The little "Petrel" fell short in like manner of her contract speed. The "Monterey" is still another vessel that did not reach her guaranteed horse-power, and the loss was over $32,800 to the builders. But Congress remitted the "Charleston's" penalty, as there was something misleading in the plans and information procured from England for her builders to work from; and it also came to the relief of the builders of the "Petrel."

The time penalties afford a considerable source of offset for the Government's outgoes in premiums, and can easily be borne where a heavy speed bonus is secured. In the case of the "Concord" and "Bennington," however, the small premiums were more than wiped out by the time penalties.

THE WEEK.

The Standard Oil Company have just received what is probably the finest oil barge ever built. It was constructed at Roach's shipyard, Chester, Pa., and is built of steel throughout. The vessel has a molded length of 248 feet, beam 37 feet and depth 19 feet, and possesses a carrying capacity of 760,000 gallons in bulk, with a gross tonnage of 1599. She is schooner rigged and carries four masts.

Japan claims to have the swiftest cruiser afloat, in the "Yoshino," lately built for the Japanese navy by Armstrongs. The vessel, which is 350 feet long and of 4000 tons displacement, is said to have made an average speed, with and against tide, of 23 knots an hour.

Crop failures and the large migration of farmers to the newly opened Cherokee strip are said to have almost depopulated a section of Southwestern Kansas. The secretary of the State Senate reports that in six counties at least the general exodus has been sufficient to disentitle them to representation in the Legislature.

The Irrigation Convention, lately in session at Los Angeles, Cal., is likely to give considerable impetus to the irrigation movement in the West, where nearly 300,000,000 acres of land might be made productive and populous by the general adoption of such a system. Congress will be urged to take up the matter at as early a date as possible.

The State Pardon Board of Pennsylvania, in session at Harrisburg last week, refused to recommend executive clemency to Hugh F. Dempsey, ex-master workman of District 3, Knights of Labor, and Robert Beatty, convicted for participation in the Homestead poisoning cases and now undergoing sentence in the Riverside Penitentiary.

Coastwise traffic between New York and Southern ports has shown a large increase during the past week or two, a number of extra steam vessels having been put on to meet the demand for freight. Provisions and dry goods compose to a large extent the cargoes going south, while cotton fills the north bound steamers. An unusually large amount of cotton is now in this city awaiting shipment to Europe.

The mysterious purchase by a New York commission house, within the past few days, of the new American built steamer "El Cid" of the Morgan line and her alteration into an armed cruiser, together with the acquisition by the same parties of some $200,000 worth of arms, has given rise to much speculation as to the destination of the purchases The general conviction is, however, that the Brazilian Government are the principals in the transaction. Later reports have it that Ericsson's submarine torpedo boat "Destroyer" and the swift steam yacht "Feiseen" have also been secured for the same quarter, as well as "El Rio," sister vessel to "El Cid."

A delegation of merchants and carriers doing business with Venezuela, Colombia and Hayti interviewed the President, at Washington, on Saturday, with the object of obtaining a suspension of the policy of retaliation against those republics.

The new United States gunboat "Machias" returned to the Brooklyn Navy Yard from her final trial at the end of last week. The trial trip extended a distance of about 360 miles, and the "Machias" was kept under persistent headway for 48 consecutive hours, being put through a searching inspection in every detail. The Board of Inspection reported her as acceptable, and the vessel was accordingly accepted by the Government. She will probably be ordered to the China Station shortly.

Statistics of the coal production of the United States for the year 1892, just issued by the Geological Survey, showed that 179,000,000 tons were put out last year, valued at the mines at $207,566,381. Of this amount Pennsylvania furnished 99,000,000 tons, or more than one-half.

The bill to grant an American register to foreign built vessels has been favorably reported to the House by the Committee on Merchant Marine. The bill will probably secure the early consideration of Congress.

Petroleum has been discovered in Susquehanna County, Pa. The Standard Oil Company are leasing all the land possible and will proceed with the boring of wells immediately.

Trade Publications.

THE VENTURI METER.—This meter—the invention of the well known hydraulic engineer, Clemens Herschel—is very fully described in a pamphlet by the Builders' Iron Foundry of Providence, R. I., who manufacture it.

The meter is named from the Italian philosopher Venturi, who first called attention, in 1796, to the relation between the velocities and pressures of fluids when flowing through converging and diverging tubes.

It consists of two parts—the tube, through which the water flows, and the recorder, which registers the quantity of water that passes through the tube.

The tube takes the shape of two truncated cones, joined at their smallest diameters by a short throat piece. At the up stream end and at the throat there are air chambers, at which points the pressures are taken.

The action of the tube is based on that property of the Venturi ajutage which causes the small section of a gently expanding frustum of a cone to receive, without material resultant loss of head, as much water at the smallest diameter as is discharged at the large end, and on that further property which causes the pressure of the water flowing through the throat to be less, by virtue of its greater velocity, than the pressure at the up stream end of the tube, each pressure being at the same time a function of the velocity at that point and of the hydrostatic pressure which would obtain were the water motionless within the pipe.

Usually the tube is made of cast iron, with a bronze throat piece, or a bronze lining in the throat.

The recorder is connected with the tube by pressure pipes which lead to it from the chambers surrounding the up stream end and the throat of the tube. It records the flow of water so that readings may be obtained in the ordinary way, and is as durable and not more complicated than an ordinary eight-day clock. It may be placed in any convenient position within 1000 feet of the tube, and there may also be an electric device by which the record may be made at any distance (several miles if desired) from the meter. It is operated in part by a weight and in part by clock work.

The difference of pressure or head at the entrance and at the throat of the meter is balanced in the recorder by the difference of level in two columns of mercury in cylindrical receivers, one within the other. The inner carries a float, the position of which is indicative of the quantity of water flowing through the tube. By its rise and fall the float varies the time of contact between an integrating drum and the counters by which the successive readings are registered.

Usually the integrating drum revolves once in every ten minutes, and at each revolution the counter registers, on ordinary dials, the volume flowing for that period of time. This interval of time may be shortened if desired.

There is no friction of stuffing boxes to retard the movement of the float and impair its accuracy, for the integrating drum is inclosed in a shield or vessel which is practically an enlargement of the receiver in which the float moves, and the shafts passing through the stuffing boxes are driven positively by the motive weight, the province of the clock work being to pull a lever and set a stop at the required periods.

There is no limit to the sizes of the meters nor the quantity of water that may be measured. Meters with 24-inch, 36-inch, 48-inch and even 20-foot tubes can be readily made, and can be set with no more difficulty than ordinary pipe.

The meter is not affected by water hammer or substances in the water. It is accurate and enables measurement of large volumes of water to be obtained with little difficulty where, perhaps, they could be measured only laboriously or approximately and clumsily.

The meter is useful for irrigation systems and for mills and factories as well as for water works. A 36 inch meter measured the main water supply of the World's Columbian Exposition and a 6-inch meter was on the supply of the Waukesha Hygeia Mineral Springs Company, who furnished the drinking water for the fair.

TWO CATALOGUES have been received from D. Saunders' Sons of Yonkers, N. Y., one illustrating their well-known pipe machinery and the other their hand tools for cutting and threading gas and steam pipe. These catalogues cover the entire line of pipe threading machinery and the necessary parts and attachments The facilities of this establishment are such as to enable them to present a class of tools made from carefully studied designs, and intended to meet the present demands of the trade, which call for strong, accurate and durable hand tools and machines.

WE HAVE RECEIVED from the Waterbury Farrel Foundry & Machine Company of Waterbury, Conn., a catalogue of their drop presses. Among others the following machines are illustrated: Round and square slide foot presses, foot press with iron kick treadle, foot press extra high and with extra wide bed, weighted compound lever foot press, screw presses, portable drop presses, drop hammers with automatic lifters, die sinking machines and die grinders, bicycle spoke upsetting and heading, and threading machines, &c.

We take the following from the *Railway Age* because it has a much wider application than to railroads alone: "A certain president was saying the other day that popularity among his employees was one of the worst traits that a railway official could have. It was always, he said, expensive to the road in the long run, and when a man came to be too well liked it was time he went to some other road. There is a good deal of shrewd truth in the remark, however unkind and illiberal it may sound. There is a kind of popularity which degenerates into familiarity and slapping on the back, and that, if it does not breed contempt, is certain sooner or later to injure the discipline of the road. Popularity which is won at the expense of respect is a dangerous attribute for any man who has to keep control of others; and even worse is that popularity which an official sometimes gains at the expense of his own superiors and of the other officers of his road. As soon as a division superintendent or an assistant of any kind stoops to win popularity among his subordinates at the expense of his chief, it is time he was got rid of. Perhaps the chief may deserve it and ought to be got rid of, too. But the other should go first."

The Outlook.

A study of the causes which have led to the prolonged business depression possesses interest chiefly because their correct appreciation will enable business men to observe the signs of a return to a normal condition. We believe that it is quite generally acknowleged that the distrust on the part of foreign holders of securities as to the inability of our Government to continue the monthly purchase of silver safely was the first impetus on the downward path. When the financial cyclone struck first our banks and then our business and manufacturing community, consumption was proceeding at a normal rate. The condition of the money market cut off all those enterprises of a public character which depend upon the marketing of new issues. The iron industry was among the first to feel the effect. A second effect was to lead to the cessation of all repair work on our railroads, which induced the canceling of old orders and held back any new work. Simultaneously the frequent failures brought about a very cautious method of operations among large traders. The rapid decline in prices induced buyers all over the country to purchase from hand to mouth, since they were convinced that every successive purchase could be made at lower and lower figures.

The wholesale suspension of work threw out of employment many thousands of men, while the mass of the industrial population had to submit to reductions in wages. Enforced economy reduced consumption of the staples, and the retail trade which was last to feel the effects of the panic began to suffer severely.

The recovery must be along the line traversed in the downward path. One of the troubles which has been at the root of the evil has been cleared away. Money is as plentiful as it ever has been. But it will take a long time before it galvanizes commerce and industry with renewed life. There are elements in the situation which make moneyed men still cautious. It takes time before a capitalist grows tired of having his money unproductive, before the eagerness for better interest overcomes the fear for the safety of the principal. The wage earner who has been forced to draw on his hoard of savings, or has run into debt, does not become a liberal buyer as soon as his income is restored to its usual amount. In other words, consumption rallies only slowly from the check which it has been subjected to, and that holds true as well for the requirements of great undertakings as for the necessities of the mass of the working people.

A good deal of stress is laid by merchants upon the fact that stocks of all classes of manufactured goods in the hands of the traders and jobbers who are nearest to the consumer are lighter than ever before. It must be conceded that that is an important element in the situation. But it is not likely to have much influence upon prices, so long as the buyers know that there is a very large reserve manufacturing capacity. At the present rate of consumption there must be considerable swelling of trade before manufacturers are sufficiently confident of future orders to hold back for better figures. Another point which aids in retarding recovery is that a period of sinking prices causes buyers to adhere to a policy of purchasing in small amounts and withholding orders as long as possible. It is true that this ultimately creates a very rapid upward movement, which in the past has culminated in historic "booms." There are those who see in the present situation all the elements of such a phenomenal rise, but with the tariff question looming up as a very disturbing factor there is no prospect of any marked advance in any quarter in the near future.

Engineers and Mechanics in the Navy.

Chief Engineer Melville, in his report just issued, again calls attention to the fact that there are not enough engineers in the navy to properly care for the machinery placed in their charge. The efficiency of the members of the engineer corps has never been disputed, but no matter how capable and energetic an engineer may be there is a limit to his physical endurance and he can stand only a certain amount of overwork. That there is danger of serious trouble some day arising from this paucity of numbers has been pointed out in former reports. Spending millions of dollars on a vessel and then compelling a few overworked men to be responsible for its welfare seems to be ridiculous in the extreme; and yet this is the exact condition of affairs in the United States Navy at the present time.

The marine engineer of to-day must be a man of the highest attainments and of unimpeachable character. Natural aptitude, long and close study, quick insight and the ability to do the proper thing at the right time and under the most adverse circumstances are the qualifications needed to fit him for his position. Young men of this stamp are loath to enter the engineer corps, and perhaps the most notable debarring influence is that the engineer is practically without rank. His position is one of vast responsibility, but it is not recognized. That this evil should be remedied and that, if remedied, the service would be benefited are points brought out in this report. On this subject Chief Engineer Melville says:

> Coming to the question of conferring positive rank, instead of the meaningless "relative rank" now held by members of the Engineer Corps, I earnestly trust that the department will recommend to Congress some measures looking toward this just and proper recognition of the service performed by the officers of this corps. Why officers devoting their lives to the service, who have always had a certain portion of the crew to organize, muster, discipline, station and drill in the various maneuvers intended to make the vessel efficient and destructive, and who, from this time on, will have under their control from 25 to 60 per cent. of the entire ship's company, should be denied recognition as a military element in a fighting organization would be incomprehensible to any one not familiar with the inside workings of the navy.
>
> In the naval battle of the future a ship will fight with her engines as well as with her guns; the ram will be a more dangerous weapon and one more feared than the battery, and if her boilers or her engines fail, the vessel will become a drifting mass, absolutely at the mercy of the enemy.

There is a further difficulty in obtaining high grade mechanics, and especially coppersmiths, at the wages paid—$50 per month. There is much work for the coppersmith and his services are constantly in demand, but this work is now always done on shore. The recompense, so insignificant compared with that to be had on shore, the restraint under which the men are placed and the killing of their ambition because there is no chance for advancement, all tend to keep out men of the right stamp who do not crave the privilege "of sleeping in a hammock" for $50 a month and "found."

One of the Pittsburgh mills has demanded of the men making application for work that they sign a paper binding themselves not to become members of the Amalgamated Association of Iron and Steel Workers. This course has thoroughly aroused the union men, and has led to a large mass meeting in Pittsburgh, at which vigorous speeches were made and resounding resolutions were passed. We believe that it is a very grave mistake to demand of any man that he make a promise of this kind. The workingmen have a right to organize, and it is far better that they do so openly than that they be forced to secrecy. No man will sign a paper of the kind, under the stress under which the unemployed are during this depression, without making the mental reservation that he is doing it under unfair compulsion. He is simply made to feel mean, a feeling which must rankle and create enmity and trouble later on. Few will blame a workman who breaks a pledge extorted under such circumstances. It is unwise to insist upon an agreement which the employer has no means of enforcing. The Amalgamated Association has become the victim of its

Hosted by Google

own folly and of developments in the iron trade over which it has no control, although it attempted to resist them. To unnecessarily aid it by investing its members with the glories of martyrdom is a very serious mistake.

Shop Transportation

Recent developments in methods and appliances have brought to the front the importance of adequate means of transportation of materials within the limits of the shop and modern manufactory. The means to be adopted and the relative expenditure advisable must, above all, depend upon whether the goods to be transported are manufactured or built, as those two words are usually understood.

Where manufacturing has become a fine art the transportation facilities may be so specialized as to be capable of handling only specific classes of materials or individual parts of standard machines, either separately or in bulk. But when it becomes a matter of building only one article or machine of a kind, the arrangements must be of such general character as to meet all possible conditions.

Between these two extremes lies the golden mean to be attained in most manufacturing establishments. Special arrangements are almost universally provided for individual machines, but usually as a means of ready handling and for movement through only a short distance, rather than for actual transportation about the plant.

But the mechanism and arrangement which serve to convey a piece from one machine to another, as the process of completion is carried forward, enters most decidedly as a factor in the transportation facilities. Such is the convenient scheme of overhead traveling trolley with switches for individual machines, and even the ancient jib crane swinging the piece from each machine to its neighbor. The introduction of the pneumatic hoist has aided much in the operations of such arrangements.

For moving small pieces in bulk or larger pieces of symmetrical shape the belt or chain conveyor has proved an economical means, while the pneumatic tube still presents ample opportunity for its utilization. The massive traveling crane, developed from the hand trolley, has almost leaped into prominence, and its latest development in connection with the electric motor as a means of propulsion has placed at the command of all a method of transportation from one part of a building to another that cannot be excelled.

The place of the hand truck has been usurped by the modern narrow gauge shop railway, with its switches and turntables. its easy running cars and its ready adaptability to all conditions and arrangements. Whether the motive power shall be human or animal, or whether the work shall be done by steam or electric locomotive, by cable or by electric trolley system must depend upon the weight, character and number of the pieces and the distance they are to be carried.

When the interest and depreciation account upon such appliances is compared with the running expense for manual labor, which would otherwise be necessary, it is surprising to see what expenditures the manufacturer would be justified in making, and what economies would result from the introduction of improved facilities for transporting his manufactures about the establishment.

CORRESPONDENCE.

The Effects of Cheap Beams.

To the Editor: Referring to the article in your issue of yesterday on "The Effect of Cheap Steel Beams," it would have been more complete if you had added that, as a result of the present low prices of beams, several firms interested in these concerns are in the hands of receivers or assignees, and every beam now made is made at a positive loss to the mills. X.

TRENTON, N. J., October 27.

The Orinoco Iron Mines.

To the Editor: There is so much being said in regard to cheap iron ore from the Mesaba region, and furnacemen east of the Allegheny Mountains are looking for a cheap high grade ore, that I would like to call their attention to the large body of iron ore on the Orinoco River, at Imataca, S. A. This ore is fully as high in iron and as low in phosphorus as the Lake ores, and the following will show what the cost of each ore would be:

Mesaba Ore.

Royalty	$0.50
Freight to Duluth	.65
Mining	.25
Freight to Buffalo	1.20
Freight from Buffalo	1.75
Total	$4.35

Imataca Ore.

Royalty	None
Freight to New York	$1.80
Mining	.50
Freight from New York	.60
Duty	.75
Total	$3.65

Yours truly,
"MINING ENGINEER."

OBITUARY.

O. B. NORTH.

Oliver B. North, senior member of the firm of O. B. North & Co., New Haven, Conn., died on Monday, 23d ult. Mr. North had suffered from a severe attack of apoplexy a few days previously, but this attack was merely the culmination of organic troubles to which he had been a victim for years. Mr. North was born in March, 1817, in New Britain, Conn. He was the son of Alvin North of New Britain, and a grandson of James North, the first manufacturer of hardware in Connecticut. The latter and three brothers, Seth J., Henry and James, were all manufacturers of hardware in New Britain. This family of manufacturers were the first to manufacture hooks and eyes for ladies' dresses, and either the first or second concern to make sleigh bells. These hooks and eyes were made by hand, and in 1828 Alvin North invented the first machine for making hooks and eyes. A. North & Son ran the first steam engine in New Britain, and the second in the State. The firm of O. B. North & Co. were formed in 1843 as manufacturers of saddlery and harness hardware in New Britain, Conn. In 1863 the establishment was destroyed by fire, and the firm removed to New Haven. Before leaving New Britain a brother-in-law of Mr. North, Mr. Brace, was admitted as a partner. The firm have been located in New Haven since that time and have done a successful business. Mr. North was a man of varied information and good judgment in business matters and had many excellent qualities, and appreciative tributes are paid to his worth.

Induced Draft in Marine Boilers.

Some very important results are likely to follow the trials of boilers in the navy during the maneuvers of the past summer, says the *Enquirer*. Many opinions have been expressed concerning the value of the induced draft system as compared with the forced draft system, some engineers holding that there is no ground for comparison, as both systems result in the same thing—namely, a mere difference of pressure between the fire grate and the top of the chimney. However this may be, it is certain that several of the attempts made to stop the destruction of boilers in the navy by means of ferrules of various kinds have only proved to be palliatives, for there are several ships now which cannot be driven at anything like the full power of the engines in consequence of the tender care necessary with the boilers. On the other hand, some of the most recent additions to the navy are reported to do very well, but the experiences with the "Barfleur," the "Barham" and the "Bellona" all point to the necessity for an examination into the causes of perhaps the most unsatisfactory boiler performances ever known. Something of this kind will no doubt result from the experiments, or rather trials, which the Admiralty have now ordered to be made with the "Gossamer," presumably as a result of the report of Commander Rowland E. Berkeley, who commanded the "Gossamer" during the recent maneuvers. As is very well known, it was the duty of all those who commanded the vessels during these maneuvers to report on the behavior of that which is included under the head of machinery. Commander Berkeley's report on the boilers and stoke hold arrangements and performances on the "Gossamer," which is fitted with both the forced draft closed stoke hold and the induced draft open stoke hold, is remarkable for the very strong terms in which he speaks of the superiority in every respect of the boilers worked under the induced draft system. He deals with every leading question, such as steaming capacity, condition of stoke hold, the ability of the stokers to do their work without fatigue, the cleanliness, the coolness—not only in the stoke hold, but of the funnel, while the other funnel was dangerously heated—the working throughout without hitch, and the quickness with which steaming up for increase of speed may be done to order without fear of boiler damage or leaking. On all these points, he says, the induced draft system was so much the superior that there can be no comparison made between the two systems. Now that the induced draft system is at last to be fully tried, we may hope that the information which will be obtained will be made public, for if, as is maintained by some, there is an essential difference between the induced draft of the thick fired successful locomotive boiler and the plenum of the forced draft leaky marine boiler, then we ought to be told why. That there is a difference the Admiralty seem now to be satisfied, for two new ships are specified to be fitted with induced draft.

Manual Training Schools.

At the dedication of the Louisville School of Manual Training, which occurred a short time since in the city named, Prof. C. M. Woodward delivered an address, in the course of which he reviewed at some length the subject of manual training. In the course of his remarks a number of points were touched upon in a way to interest a large number of our readers, and we therefore present copious extracts in this connection. He said that the occasion was one which seemed to demand an exposition of the principles involved in the manual training movement, and he considered it proper, therefore, to speak of the history and character of manual training. In describing its evolution he said :

Manual training, as an educational factor, owed its existence to a widespread conviction that the education of the schools had been dealing too exclusively with the abstract and the remote, and not enough with the concrete and the present. The thought product of the school was too dim and uncertain, and the knowledge gained had no sufficient bearing upon the matters of daily life. Consequently the pupil lacked mental vigor and clearness, and his school experience was deficient in practical elements. Manual training embodies pre-eminently the modern idea of substituting things for words, observation for printed description, and personal experience for the recorded experience of others.

ENGINEERING SCHOOLS.

Schools for civil engineering were established some 50 years ago to train men to build the railroads, bridges and canals that increasing traffic demanded. With the steam engine and its application, not only to commerce, but to every field of labor, came the demand for mechanical engineering. Similarly with the development of electricity, electrical engineering has sprung forth in full stature as a new profession.

All these branches of engineering require as preliminary studies a knowledge of the theory and use of tools, and the methods of precise and scientific construction. This requirement was met by incorporating shop work into the professional courses, as was first done at the Polytechnic, at Worcester, Mass. ; at the Massachusetts Institute of Technology, in Boston ; at the State University of Illinois, at Washington University in St. Louis, and at other places in a less marked degree. Then came the thought that tool work and drawing should be classed among the preparatory branches with elementary science and mathematics. With this thought came an effort to reduce the teaching of the theory and use of tools to a science. Let me illustrate the evolution of our methods by analogy. There must have been a time when, with a view to economy and better instruction, some one, reflecting upon the various calculations of the accountant, the builder and the financier, discovered that all numerical operations came under four heads—viz., addition, subtraction, multiplication and division. The suggestion was then made that it would save time to teach those fundamental rules carefully and well before attempting to teach their application. Children could be taught to multiply and divide rapidly while too young to appreciate exchange, taxes and mensuration.

In precisely the same way, after ages of failure to comprehend the problem, the fundamental rules of tool work have been discovered and arranged in logical order suited to class or individual instruction. It is now seen that old systems of apprenticeship, by which one mastered the use of certain tools and acquired a knowledge of a certain trade, was wasteful and narrow to the last degree. Much time and many opportunities for broad culture were thrown away, and only a narrow and one-sided training was secured. To be sure, tools have improved and multiplied and the stock of materials has increased ; nevertheless, the fundamental principles once recognized are readily applied.

MANUAL TRAINING.

In manual training, pure and simple, only tools and methods of use are taught. The shop exercises are almost as abstract as in "long division." A mortise and tenon joint typifies nearly everything in joinery—the tenon may be single, double or multiple ; it may be plain or dovetailed, or without a pin or wedge. The joint may be blind or open, rectangular or oblique. In its construction, one may use the plane, the try-square, the bevel, the gauge, the saw, the bit, the chisel, the mallet, the knife, the vise, the bench hook ; and it may be put together with paint or glue. However, before an elaborate joint can be properly undertaken, the theory and use of each tool, and how it can be put in order and kept so, should be carefully taught and learned by abundant practice. Beyond a few examples, possibly a single example, of synthetic construction for the sake of illustrating the application of general principles, the manual training school need not go. Similar statements can be made in reference to wood turning, wood carving, forging, tempering, molding, pattern making, metal fitting, &c. Almost the only thing a student should be able to show at the end of his training is the discipline, the knowledge and the clear insight he has gained. If he is able to make a merchantable article of any sort—a bureau, a horseshoe, a chisel or a dynamo when he is through school—well and good; there can be no objection, but there would be serious objection to his stopping his studies at school for the purpose of making such articles.

It thus appears that the graduate of the manual training school has acquired no trade, though he is familiar with the underlying principles of many trades ; he has earned no money, he has earned no business, he has not even an adequate notion of the practical and educational value of his experienced skill. These latter things are not the fruit of schooling ; they come from subsequent experience. As the trained gymnast, has developed every muscle, co-ordinate physical actions, and learned to use his judgment and maintain his self control at all times and in all positions, with no definite idea of how such training will serve him in life, so the broadly and rationally trained user of tools does not know in what emergency he will call to his aid the skill and training he has gained here. Both he and the world have yet to rise to a proper appreciation of the trained intelligence which quickly comprehends the thought of a new mechanical appliance and the force of new conditions. It should now be clear that in every craft, whether lower or higher, there are certain foundation principles, mental and physical, which underlie actual practice, and that it is the province of the manual training school to furnish opportunity for the mastery of these foundation principles, and that its claim to be a school for general education permits it to go no further. Finally, in a single phrase, manual training is that department of general education whereby one acquires the mastery of tools and materials.

HISTORICAL SKETCH.

About the year 1868 Victor Della Vos, Director of the Imperial Technical School of St. Petersburg, published a report giving for the first time the correct method of tool instruction. In his school three years were spent in training, and three years in actual technical work. His method, which was that of separating instruction from construction, was not made known in this country until the Philadelphia Exposition of 1876. The credit of calling attention to the Russian educational exhibit is due to president John D. Runkle of the Massachusetts Institute of Technology, who made a full report of their method of tool instruction to his Board of Trustees that year. In 1877 President Runkle opened shops for instruction in tool work, on the Russian plan, in the institute. Soon after the School of Mechanic Arts was opened as a subdepartment of the institute for the instruction of mechanics not less than 15 years old. It had a two-year course of study, including drawing and English studies. The attendance at the school was never large. It was discontinued two or three years ago.

Meanwhile shop work for the sole purpose of instruction had been introduced into the Polytechnic School of Washington University, St. Louis, as early as 1874. In 1877 three shops were fitted for the complete round of tool work, and classes from preparatory schools were admitted. On the strength of that experience a distinct and separate preparatory school, known as the St. Louis Manual Training School, was opened September 6, 1880. The course of instruction covered three years, and was very broad and general. This school is now in its thirteenth year, with 300 students under the charge of a director and 14 assistants. The immediate and acknowledged success of the St. Louis school led to the establishment of the Chicago Manual Training School by the Commercial Club of that city. The school was opened February 4, 1884. The school has upward of 300 pupils, all seats being occupied. Baltimore opened its Manual Training School March 5, 1884, as a part of the public school system. Including some classes below ordinary high school grade, its enrollment is upward of 500. Manual training was introduced into the High School of Toledo, in Ohio, in December, 1884, and during the following year the Scott Manual Training School was built in connection with the high school building. Under joint management the school is open to both boys and girls as a part of the public school system. Manual training was introduced into the College (high school) of the City of New York, in 1884. The Miller "Manual Labor" School, now very nearly a school for manual training, was established at Crozet, Albermarle county, Va., early in the 80's.

Philadelphia opened its Central Manual Training High School in 1885. The school was soon filled to its utmost, and a second one was opened by the School Board. The last report shows that these schools are crowded with a total enrollment of 576 pupils. The Cincinnati Technical School (really a school for manual training) was opened by a corporation in 1886. Following these schools the growth of manual training has been rapid, and the interest is still increasing. It is impossible to give even an approximate list of the schools established either independently or in connection with existing high schools. Nearly every State agricultural and mechanical college has a manual training department of about the high school grade, conspicuously those of Kansas, Indiana, Pennsylvania, Texas, Arkansas, Mississippi, North Carolina and Ohio.

MANUFACTURING.

Iron and Steel.

Last week the Linden Steel Company of Pittsburgh went out of the hands of the assignee and again took possession of their own business. The change was the result of an order made by the courts discharging the Safe Deposit & Trust Company as assignee. This was caused by an agreement between the firm and their creditors, all of the latter to whom sums exceeding $100 were due agreeing to an extension. The creditors for $100 or less were paid in full, their claims aggregating $2409.14.

Clinton Furnace of the Clinton Iron & Steel Company, at Pittsburgh, has been banked down, owing to a large stock of pig metal being on hand.

Nearly all departments of the Wayne Iron & Steel Works of Brown & Co., Incorporated, at Pittsburgh, were put in operation last week. The puddling department of the firm, which was closed down temporarily owing to the refusal of the puddlers to sign an agreement not to join any labor organization while in the employ of this firm, has also been put in partial operation.

The works of the United States Iron & Tin Plate Mfg. Company, at Demmler, Pa., manufacturers of tin and terne plate, are in full operation, the firm having a very active demand for their various brands of plate. A fact generally known to the trade is that to this concern belongs the distinctive title of being classed as the pioneer manufacturers of tin plate in this country. In 1873 this concern engaged in the manufacture of tin and terne plate at their present location, but of course their plant was considerably smaller at that time than it is to-day. When the change was made in the tariff by which the duty on tin plate was considerably lowered, the company were compelled to abandon its manufacture, and confined themselves exclusively to the production of iron and steel sheets, dripping and bread pans and other goods of a similar nature. The restoration of the duty on tin plate by the passage of the McKinley bill resulted in this firm spending over $100,000 in the remodeling and enlarging of their plant in order to engage again in an industry which they were compelled to abandon many years before. During the worst period of the business depression their tinning department was kept in constant operation, and nearly all the time to full capacity. This company have published recently a pamphlet giving valuable information to users of tin plate.

Taking effect on November 1, the wages of day laborers in the employ of the Sharon Iron Company, Limited, at Sharon, Pa., were reduced 10 cents per day. The wages of blast furnace employees have also been reduced 10 per cent, taking effect on the same date.

A short time since the Brilliant Iron & Steel Company of Brilliant, Ohio, manufacturers of iron and steel bars and special shapes in iron and steel, had an opportunity to close a contract for puddling which would have given their employees at least two months' work. But owing to the fact that this firm have been paying $5 per ton for boiling, it was impossible to continue to pay this price and accept the contract. The firm therefore made a proposition to their men, offering to pay $4 per ton for boiling, stating at the same time that Pittsburgh mills were having their boiling done at this price, and unless their employees would accept the proposition they could not start the plant. The workmen refused to go to work at $4 per ton and thus the matter stands. We understand the entire plant of this concern is idle for an indefinite period.

The rolling mill of the Chicago Forge & Bolt Company, at Fortieth street and Stewart avenue, Chicago, was leased some time since to Thomas S. Blair, Jr., and E. Protzman of Pittsburgh, who fitted it up to manufacture small steel angles, channels, Z bars and special steel shapes of small size. They operate the mill under the name of the Chicago Rolling Mill Company, with Chas. W. Goodrich & Co , The Rockery, Chicago, as purchasing and sales agents. It is closed at present, but will be started up again as soon as trade revives.

The West End Rolling Mill Company, Limited, of Lebanon, Pa , are running their chain works at their full capacity. They claim that they have enough work ahead in this department of their plant to last until spring.

The Joliet Steel Works of the Illinois Steel Company have been greatly changed and improved since they were last in operation. The old converters have been replaced by two 10-ton converters, which will cast in molds on a car instead of in a pit, as had heretofore been the practice. This will obviate the necessity of handling the ingots, to load and remove them after the molds are filled. The car will then be drawn out and as soon as the ingots are sufficiently cooled they will be mechanically stripped. Electrical appliances have been introduced in some departments to save labor and increase the efficiency of the machinery. Cold metal will be hauled up an incline and automatically dumped from a skip into the cupola, precisely as ore or coal is hauled. The billet mill has been completely overhauled and remodeled, and a much greater output is assured than before as soon as the new machinery gets to running smoothly and the workmen become accustomed to handling it. The converters and billet mill are the only part of the works to be put in operation at present. The rod mill will not start up until there is a better demand for rods, while the blast furnaces will remain idle until the large stock of pig iron on hand is consumed.

The Ohio Iron & Steel Company, at Lowell, Ohio, announce that they will start their Mary Furnace about November 1. During the past four months' stoppage many improvements have been made and the furnace relined throughout. The company state that it is not from any favorable indications in the outlook that the start is made, but having made a specialty of Mary Ohio Scotch foundry iron for many years, and the supply on hand being about exhausted, they feel called upon to take care of a trade whose demands at present, although limited, are none the less imperative in order to preserve the uniformity of their cupola practice.

Blast furnace No. 1 of the Burden Iron Company, Troy, N. Y., which had been idle five months while being rebuilt, was blown in on the 26th ult. Employment was given to 100 additional men.

The employees of the Birdsboro Nail Works of the E. & G. Brooke Iron Company, at Birdsboro, Pa., have returned to work at a slight reduction in wages.

One of the two blast furnaces of Richard Heckscher & Sons, at Swedeland, Pa., has closed down.

The Ohio Falls Iron Works, New Albany, Ind., have resumed operations in all departments after a shut down lasting two weeks. During the temporary suspension of work a large new fly wheel and two large cog wheels were set up.

The employees at the furnace plant and steel works of the Sharon Iron Company, Limited, Sharon, Pa., have been notified of a reduction in wages of 10 to 15 per cent.

The Salem Iron Company of Pittsburgh have purchased the Grafton blast furnaces at Leetonia, Ohio, from the creditors of Graff, Bennett & Co. At this time one stack is in blast, but if the iron market does not show early improvement it will probably be banked about the first of the year.

The works of the Ellwood Shafting & Tube Company, at Ellwood City, Pa., are now in full operation in all departments, turning out a large product of seamless steel tubing for bicycle and other purposes for which this tubing is particularly adapted.

We are advised that the statement that the Elba Iron Works and the Continental Tube Works, owned by the Oil Well Supply Company, Pittsburgh, would be put in operation at an early date is untrue. At present there is no prospect of either of these mills being started up.

Operations were resumed at the Portage Iron Works, Duncansville, Pa. The management and the employees adjusted their differences and the workmen in the finishing mills accepted an average reduction of 25 per cent. in their wages.

At Muncie, Ind., the Whitely Malleable Iron Works have commenced the work of building a new structure 125 x 50, which, when completed, will be operated as a gray iron works in connection with the present malleable iron works.

The Penn Iron Company, Limited, of Lancaster, Pa., have decided, it is stated, to close their rolling mill and other works on account of lack of orders. The company employ 350 men.

At Muncie, Ind., the White River Iron & Steel Works have started making bar iron and steel, and the Whitely Reaper Works have announced that they will resume operations October 30.

Machinery.

The Lebanon Boiler, Foundry & Machine Company of Lebanon, Pa., successors to I. Pott & Co., are making a specialty of furnace barrows, and are meeting with much encouragement in this line. Their regular line includes boilers, engines, pumps, tanks, stacks, bells, troughs, kettles and stable fittings. They are fitting up a large brick building near their works as a machine shop and expect to have it running very shortly. This will materially increase their capacity.

A new firm, W. J. & W. E. Davison, have commenced business at 226 North Fourth street, Philadelphia, as manufacturers' agents. They will, among other lines, push the sale of Prouty's wire valve wheel.

The Harrisburg Boiler & Mfg. Company of Harrisburg, Pa., have recently shipped a 75 horse-power water tube boiler to the Fayetteville Water Works, Fayetteville, N. C.

Geo. W. Fifield, Lowell, Mass., manufacturer of engine lathes, is erecting a new steel covered shop 250 x 60 feet, with two L's, each 120 x 60 feet. The new building will be connected with the main line of the Boston & Maine Railroad by a side track.

Hereafter all machines made by the Egan Company of Cincinnati, Ohio, builders of wood working machinery, will have placed upon them a number commencing from 50,000 and then onward, so that when repairs are ordered the mere mention of the number of the machine brings forward its pattern and class, for a complete record is made of every machine that goes out.

The cast iron pipe foundries of R. D. Wood & Co., whose headquarters are at 400 Chestnut street, Philadelphia, with foundries at Millville, Florence and Camden, N. J., have been kept running steadily through the summer, the company having experienced practically no dropping off in the volume of trade until the present month. They have, however, shared with competitors the generally prevailing low prices.

The D. E. Whiton Machine Company of New London, Conn., manufacturers of gear cutters, centering machines, lathe and drill chucks, are at present running their plant four days per week, making two-thirds time with about their regular force. They do not regard the immediate outlook for business in their particular lines as very promising.

The Common Sense Engine Works of Muncie, Ind., which went into the hands of receivers some time since, will probably start up at an early date. It is stated that the stockholders and the creditors have compromised their claims, and that under the new arrangement G. Campbell Janney will be president, J. C. Johnson, vice-president, James R. Sprankle, secretary and treasurer, and Benj. F. Howell, general manager. When running to full capacity the plant employs about 200 men. It is stated that a number of good sized orders are on the books, and it is believed that the works can be successfully operated and placed on a paying basis.

The foundry of William Tod & Co., at Youngstown, Ohio, has closed down on account of lack of orders and the general depression in business. There is a probability also, it is stated, that the machine shop will close down entirely if the present conditions of trade continue.

The Ball & Wood Engine Company of Elizabeth, N. J., whose works have been running only five days a week, have resumed on full time.

The J. I. Case Threshing Machine Company of Racine, Wis., are further increasing their capacity by the erection of a new molding shop. The structure will be in the shape of two L's, 210 x 80 feet and 84 x 80 feet respectively. It will be of brick, with an iron truss roof having a span of 80 feet. Two cupolas, capable of melting 50 tons a day, will be furnished by the Detroit Foundry Equipment Company. There will be seven steel cranes, electrically driven, the same medium furnishing power to run 800 incandescent and 14 arc lights and four motors on the hoisting derrick. In every respect this new department will be in keeping with the model establishment of which it will be a part.

Hosted by Google

The machine shop of the Anderson Foundry & Machine Works, at Anderson, Ind., has been closed. The foundry and pattern department are still running with only small forces.

The Skinner Chuck Company of New Britain, Conn., have equipped their plant with additional new machinery for the manufacture of their New Model drill chuck and new improved planer chuck and face plate jaws. The company have been awarded patents on two of these, and the slight improvement in business already noted leads them to hope that the demand will soon keep them fully occupied.

The Mechanical Boiler Cleaner Company of Montclair, N. J. have been incorporated, with a capital stock of $100,000, for the manufacture of a mechanical appliance for cleansing boilers.

The Collins Mfg. Company of San Antonio, Texas, have recently expended about $10,000 in fitting up a plant for turning out foundry and architectural iron work. Machinery to a like value is still to be purchased.

The plant of the Springfield Emery Wheel Company has been removed from the corner of Howard avenue and Spruce street to the corner of Water street and South avenue, Bridgeport, Conn. The present location is nearer the business center of the city, while the shipping facilities are much better than the old location afforded. The company have had enough business to keep their works going all the time and have several good orders on hand at the present time. They have recently put a new dynamo brush grinder on the market which is meeting with universal approval, while their specialty, emery wheel machinery, is being constantly improved.

The Pond Machine Tool Works of Plainfield, N. J., have reduced their working time to five days per week of eight hours each. Twenty-three men were recently laid off in the foundry department.

When the *personnel* of a concern remains unchanged for 13 years, it is a pretty safe evidence of the fact that harmony has existed and the affairs of the company been successfully managed. Such has been the record of the Waterbury Farrel Foundry & Machine Company of Waterbury, Conn. During the last three or four years the company have laid out $200,000 in increasing the capacity of their plant. A large foundry has been built and equipped with new cranes and new cupolas, &c.; also a new three-story brick building for making and storing patterns, and an entirely new machine shop erected on the site of the original foundry. A large amount of heavy machinery has been installed, so that the equipment of the plant at the beginning of the year was adequate for employing 350 men, which the company have been doing ten hours a day for six days in the week. With the falling off in business, they have been compelled recently to reduce this number from time to time until only 150 men are now employed. The company have been working on extensive orders for machinery for the Pope Mfg. Company of Hartford, Conn., for use in their new tube works. They have also been turning out special nail machinery for the Capewell Horse Nail Company of Hartford.

The Lane & Bodley Company of Cincinnati, Ohio, are operating their plant nine hours a day with about three-eighths of their usual force of men. While the amount of business transacted is less than usually at this time, the company are seizing the opportunity to make improvements in their products, so as to be ready for the demand which they anticipate will come at an early date.

The Lloyd Booth Company, founders and machinists, of Youngstown, Ohio, have nearly a full force of men at work, and while no very large contracts are on hand it is thought enough small orders will be received to keep their plant in operation to nearly full capacity during the winter months.

The Mahoning Boiler Works of William B. Pollock & Co., at Youngstown, Ohio, have resumed operations in full, and the firm expect to receive sufficient orders to keep running right along.

The Lodge & Davis Machine Tool Company of Cincinnati, Ohio, have recently received a number of orders from the Government for machine tools for the navy yards in Washington, D. C. Also a large order for machinery from Germany, and one from the Big Four Railroad for its machine shops in Bellefontaine, Ohio. The order from Germany is from a large sewing machine manufactory, employing about 500 hands.

The Westinghouse Electric & Mfg. Company of Pittsburgh have procured a contract for the construction of three 5000 horse-power dynamos for the Cataract Construction Company.

The Vulcan Steam Boiler Works have been incorporated at Albany, N. Y., to manufacture steam boilers, steam engines and general steam machinery in Brooklyn. Capital, $10,000, and directors, Lucian Knapp of Long Island City; Frank M. Woodruff of Brooklyn and Charles Balloch of New York City.

Later advices from the Cincinnati Milling Machine Company, Cincinnati, are to the effect that they have received a number of good orders, including several from European countries, for their specialties—milling machines and grinders—and that their working force has been increased, while part of their shops are now running 55 hours per week.

The I. & E. Greenwald Company, Cincinnati, Ohio, are running their foundry on two-thirds time, while their machine shops are running full. They report an average amount of orders, some of which, however, were booked previous to the dullness so prevalent. The company report the outlook for the future as being much brighter than for some time past.

The Tudor Boiler Mfg. Company, Cincinnati, Ohio, are operating their establishment on full time on orders, and feel very much encouraged over the prospects for new business.

Hardware.

John Booth, manufacturer of ornamental wire and iron work and successor to the Chicago Wire & Iron Works, 110 Lake street, Chicago, makes a specialty of carrying out the designs of architects in elevator inclosures, heavy wrought iron grilles, fences, railings and guards. He is also manufacturing heavy wire cloth for the use of miners and ore crushers.

At a recent meeting of the creditors of the Youngstown Stamping Company, held in Youngstown, Ohio, who were forced into the hands of a receiver by reason of the failure of Robert L. Walker, an examination of the property was made, and entire satisfaction was expressed at the manner in which operations are being conducted under the supervision of W. C. Hine, receiver. The concern are now filling large orders for oil cans and other of their products for Eastern shipment.

The New York Knife Company, at Walden, N. Y., are building a new fire proof storehouse to be 28 feet in width and 100 feet in length. The side walls will be of brick and the roof of iron, designed and built by the Berlin Iron Bridge Company of East Berlin, Conn., covered with their well known anti-condensation corrugated iron.

Chicago Brass Company, 76 Monroe street, Chicago, with rolling mill and factories at Kenosha, Wis., confine their business to the rolling of sheet metals and the manufacture of organ reeds. They advise us that they notice an encouraging increase in orders during the past few weeks.

Reed & Prince, Worcester, Mass., manufacturers of rivets, burrs and stove bolts, have just completed a new building adjoining their old plant. The addition is built of brick 175 x 40 feet, five stories and an L for engine and boiler rooms. The manufacture of wood screws, a new departure for Reed & Prince, will be begun at once.

Buck Bros., Millbury, Mass., are in receipt of a communication from the Commissioners of Awards at the World's Fair, stating that the firm's exhibit of chisels at the exposition has been awarded a diploma. The firm are at present at work on orders fpom a number of manual training schools in different sections of the United States. A large order was recently filled for export to Africa. The firm are not running their plant to its full capacity owing to the business depression.

The lawn mower factory of the F. & N. Mfg. Company, Richmond, Ind., started up on the 20th ult. They are running nearly a full force and expect to run steady during the winter.

The Waltham Screw Company, Waltham, Mass., have shut down for an indefinite period.

The plant of the Marlin Arms Company, New Haven, Conn., is now running 54 hours a week instead of 40, as heretofore.

The employees of the Atlas Tack Corporation, Taunton, Mass., suffered a reduction of 30 per cent. in their wages on October 30.

The West Muncie Tack & Novelty Works, Muncie, Ind., was destroyed by fire on the 22d ult. The factory gave employment to about 30 hands. The damage is estimated at $20,000, on which there is $3500 insurance.

The Upson & Hart Company, Unionville, Conn., have fitted up their works with the most improved machinery for the manufacture of knives, forks and spoons in nickel, silver and German silver. The production, it is expected, will reach 100 gross per day by July 1. The company refer to their process of manufacturing these goods as reducing the cost materially. Patents on the process have been taken out in England and Germany. H. C. Hart, vice-president and secretary of the company, is the inventor. The company state that they are prepared to treat with parties who are desirous of obtaining a license to manufacture under these patents.

Nicol & Co., 55 West Washington street, Chicago, manufacturers of hardware and other specialties, had an exhibit at the World's Fair of their high art hair tools and curling iron heaters, on which they advise us they have received awards. Ever since the exposition opened they state that they have been selling goods in England, Canada, Australia and South American countries, and they express the opinion that the fair will do them and other manufacturers much good.

Alfred Hess announces under date of November 1 that he has purchased the entire plant of the Union Axle Spring Works, situated at Carthage, Hamilton County, Ohio, and the concern will hereafter be known as the Hess Spring & Axle Company. Mr. Hess refers to his experience of the past 25 years, together with the latest improved machinery, as enabling him to produce goods of excellent quality and finish.

Miscellaneous.

The Allen Electric & Supply Company is the name of a new concern commencing business at 232 Carter street, Philadelphia. They will manufacture trolleys and undertake general repair work. They will also make a specialty of a self oiling bushing.

The Philadelphia Traction Company have placed the order for their new power house with the Berlin Iron Bridge Company of East Berlin, Conn. The side walls will be of brick and the roof will be of iron. The building is 190 feet in width and 168 feet in length, divided into boiler room, engine room and dynamo room.

The Locust Point Iron & Steel Works, Baltimore, Md., who were incorporated in October, 1892, for the manufacture of tin plate, with a capital stock of $100,000, have been placed in the hands of receivers. The bill of complaint alleges that notes amounting to $10,000 have recently matured which the company are unable to pay. The works are said to have cost $150,000, on which there is a mortgage of $26,000. The inability to make collections is given as the cause for the appointment of receivers.

The Dallas Stamping Company, Dallas, Texas, have suffered a loss of $10,000 by fire.

The Great Northern shops at Hillyard, near Spokane, Wash., are nearly completed, and will be in operation, it is expected, by the middle of this month.

The employees of the Calumet & Hecla Mining Company in Michigan have been notified of a reduction in wages of 10 per cent. to take effect November 1.

MANUAL TRAINING is about to be introduced into the public schools of Brooklyn, a sum of $10,000 having been appropriated to this object by the Board of Education. This will defray the expenses of the first experiment in this direction, which will be in the shape of a manual school to be established in the Boys' High School, where the rudimentary principles of several trades will be taught to lads recommended by the principals of the schools.

TRADE REPORT

The West, which has been the leader in the decline during the greater part of this year, seems destined to take the first steps toward improvement. The low prices made have evidently attracted a good deal of business from outside quarters, and the result is that the volume of orders has increased. Thus far this has not resulted in any hardening of prices, but has had only a negative effect in stopping a further giving way.

Foundry and Forge Pig in all markets are still very dull, but there are indications that a little more work is in sight. Within the next week contracts will be let for 9000 tons of Cast Iron Pipe at Philadelphia, and for 6000 tons at Waterbury. To judge from recent sales, prices promise to be low. A small lot was sold in New York recently at $19.40, delivered in the streets, and in Detroit low prices were also made. We understand, also, that about a dozen city pumping plants are being bid on, the aggregate value being about $500,000.

Sales of Steel Billets have been made during the past week at figures netting $17.30 at mill, the buyer being unable to get near the lower prices which rumor claimed as current. In fact, some of the Pittsburgh mills decline to do better than $18. Against this is the fact that the Joliet mill will soon start, and thus restrict the territory of the Pittsburgh works.

The prospect of considerably lower prices on Steel Rails is discussed with some interest. If it should stimulate buying and thus increase largely the consumption of Bessemer Pig, the whole line of Steel products might be favorably affected. During its existence the Steel Rail Association has always been looked upon as adversely influencing Steel Billets.

Chicago records the fact that sales of Bars have been made in that market as low as 1.35¢, delivered, the lowest on record, from which the price has recovered a little since. Some buyers argue that as yet the rolling mills have not given away the whole of the decline in raw material, Steel Billets and Scrap and in wages, and that, therefore, there is still room below. While this may be true so far as the nominal published quotations are concerned, it is not the fact where the private terms granted for good specifications are taken as the basis. In some markets there has not been any business likely to bring out such figures.

In Structural work Pittsburgh has again captured the latest building in Philadelphia. In Chicago there is some good work coming out, but otherwise the markets are very bare and the outlook is still gloomy.

From the sale of American craft to Brazil it is inferred that the vessels will be replaced by others and thus give our shipyards some badly needed work.

How changed the financial situation is, is shown by an incident which happened to-day. A firm received two checks from iron manufacturers, both anticipating payment by deducting 23 and 51 days' interest respectively.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., October 31, 1893.

The situation shows very little change from last week. Billets are 50¢ dearer, but with that exception anything and everything can be bought at last week's prices, and for an extra sized lot or prompt cash settlement it may be possible to do a little better than that. There is no snap to the market, and so far as regards mills and furnaces in this vicinity there is no increase to the amount of business on hand, the week's deliveries being about equal to the week's new engagements. There is a somewhat better feeling, however, due to the reports from Washington and from the West, but at this late season it is doubtful if it will stimulate the demand, without which it is useless to expect better prices. Careful inquiry among consumers fails to reveal anything likely to improve the situation, those running fullest being on about half or three-quarters time, while in the majority of cases a considerable proportion of the capacity is doing little or nothing. Low prices seem to be no inducement whatever, the general reply being, "It is not a question of price; we will buy what we cannot do without, but low prices are no inducement for anything we do not need." This represents the situation all the way through, and explains an apathy which is almost without precedent.

Pig Iron. — Notwithstanding extremely low prices, and a surprisingly small production compared with that during the past three or four years, there is plenty of Iron, and decidedly more pressure to sell than there is to buy. This condition of affairs cannot last very much longer, but all the same it is as hard to move buyers as ever it was. Prices are not quotably lower, but they are irregular, and in spots easier, particularly when there is a pressure to realize, or when spot cash or something near to it seems to be in sight. Everybody recognizes the fact that prices cannot go any lower, but on the other hand there are no indications of an upward movement, and until something occurs to force an advance, buyers are likely to remain stolid and immovable. The chances are that something of that kind will happen before long, as the drop from a supply of 180,000 tons per week to less than 80,000 tons is too great to meet the consumptive requirements for any length of time, and as soon as indications of scarcity begin to crop up it will probably set people thinking. Meanwhile, however, business is mostly in small lots at prices varying from $13.75 to $14.25, delivered, for No. 1 Foundry, $13 to $13.50 for No. 2, and $12 to $12.50 for Standard Mill Irons, and for Southern No. 3 as low as $11.25 @ $11.50 has been accepted. It is difficult to give exact quotations, as a good deal depends on brand, quantity, terms of payment, &c.

Steel Rails.—Prices are down to $27, but there is not much demand, and it is doubtful if the year's deliveries will reach 1,000,000 tons. There is no inquiry for large lots, so that prices will probably remain at $27 until there is a class of business worth considering at a lower figure.

Steel Billets.—There is a firmer tone to the market for Billets, but only a small demand, as consumers are not using anything near to their usual quantity. Sales have been made at $20.75, delivered, for 500 and 1000 ton lots, and this is now said to be an inside figure. It is not unlikely that prices will remain firm, although with such a large falling off in consumption it will be difficult to secure an additional advance unless there is a sympathetic movement along the entire line.

Finished Material.—All that can be fairly said is that the market holds its own. There is certainly no improvement, and no business of sufficient amount to cause improvement, nor is there likely to be until after the turn of the year, if then. Large work is not coming out to any extent, without which it is impossible to get up any semblance of activity. The current demand for small lots is pretty fair, but as that comprises about all the new business there is mills are not getting themselves into any better shape than they have been in for some weeks past. Prices under such conditions are naturally weak and unsatisfactory, and while nominal quotations are about as follows very much better terms can be had on good sized lots, particularly for good deliveries and a certainty of prompt settlements:

Grooved Skelp, delivered	1.47½¢	@	1.50¢
Best Refined Bars	1.52½¢	@	1.55¢
At interior points	1.40¢	@	1.50¢
Tank Steel	1.60¢	@	1.65¢
Heavy Plates	1.65¢	@	1.70¢
Shell	1.75¢	@	1.85¢
Flange	2.00¢	@	2.20¢

Old Material.—There is no material change in this department. Holders appear to be unwilling to do business at the low figures usually offered; but the demand is so much out of proportion to the supply that it is difficult to find good buyers unless by making more or less of a reduction from the asking rates, which are about as follows:

No. 1 Wrought Scrap, delivered	$12.00	@	$13.00
Machinery Cast, delivered	10.00	@	11.00
Heavy Steel Scrap, delivered	12.00	@	13.00
Old Iron Rails, delivered	14.00	@	14.50
Old Street Rails, delivered	16.00	@	17.00
Wrought Turnings, delivered	10.00	@	11.00
Cast Borings, delivered	6.00	@	7.00
No. 2 Light Scrap	6.00	@	7.00

Cincinnati.

(By Telegraph.)

Office of *The Iron Age*, Fifth and Main Sts., CINCINNATI, November 1, 1893.

While there was little, if any, increase in the volume of business in Pig Iron during the week, there is certainly a more confident undertone to the market at the close, because there is more inquiry for forward delivery and less disposition on the part of furnaces to accept orders for delivery after January except at an advance. Gray Forge can yet be bought at $7, f.o.b. Birmingham, to a moderate extent for this year, but the furnaces ask an advance of 25¢ ₱ ton for the first half of next year, but no transactions have been made public. There has been rather more than the usual run of consumptive orders in this district during the week and there have been fairly liberal orders from the East for these times, although they are far short of what they would be in a normal condition of the trade. The Iron Pipe works continue to be the largest melters of Iron, and but for them there would have been in the recent past a nearer approach to stagnation in the trade. The repeal of the Silver Purchase law is hailed as the beginning of recuperation in the Iron

Hosted by Google

trade, but not time enough has elasped for its effect to make much impression. Collections have decidedly improved and now there is little complaint of backwardness except on the part of chronic lame ducks. Quotations are as follows:

Foundry.

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke No. 1	15.00 @ 15.25
Lake Superior Coke No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Forge.

Gray Forge	9.75 @ 10.00
Mottled Coke	9.50 @ 9.75

Pittsburgh.

(*By Mail.*)

Office of *The Iron Age*, Hamilton Building, PITTSBURGH, October 31, 1893.

While it is a bold statement to make just now, and may be received with some doubt, it can be truthfully stated that for the first time in many weeks the condition of the Iron and Steel trades is commencing to show some signs of betterment. This improvement, it should be stated, does not apply to prices, but to volume of business now going and to the outlook for the near future. In the first place, the repeal of the purchase clause of the Sherman act will undoubtedly have a good effect on finances and will give a stability to business that has been sadly lacking for some time. In the second place, personal investigation shows that there is a heavier volume of business offering and this applies all along the line of Raw and Finished Material. Commencing with Pig Iron we can state there is more actual buying being done and more inquiries are coming in from buyers than at any time within the past three or four months. Steel is in considerably better demand, the tonnage for the week being the heaviest for some time past. Going right through the entire list of Finished Material there is more or less business doing, some lines of course making a better showing than others. It would also seem that the conviction is becoming stronger among buyers that the level of low prices has about been reached, and that there is no risk in buying for future wants at prices now ruling. The fact is fully recognized by buyers, or should be, that the period of severe depression through which we have gone, and which made it necessary for mills to practically allow customers to make prices, must come to an end some time, and when trade again resumes its normal condition there is bound to be a recovery in values sufficient to allow a fair legitimate profit to the producer. Indications are already present which show it to be possible for this recovery to set in at no distant date.

Pig Iron.—During the week inquiries were more plentiful, with the result that a fair amount of Iron has changed hands since our last report. The increased activity in the Steel market has resulted in a heavier demand for Bessemer Pig, and several fairly large sales have been made within the last few days. There is also a little more doing in Gray Forge, but prices show no signs of improvement. One or two additional Edgar Thomson stacks have been started, and it is stated that the entire equipment of nine furnaces will be running before this month is out. It is also likely that the Monongahela Furnace Company will put their second stack on Bessemer within a week or so to make stock for the new Steel plant. We quote as follows:

Neutral Gray Forge	$10.50 @ $10.75	cash
All-Ore Mill	10.75 @ 11.00	"
Bessemer Pig	11.25 @ 11.50	"
No. 1 Foundry	12.50 @ 13.00	"
No. 2 Foundry	11.50 @ 12.00	"

We note a sale of 2000 tons of Bessemer at $11.25, Pittsburgh, for balance of the year delivery. Also one of 500 tons of Gray Forge at $10.75, Pittsburgh.

Billets.—There is a fairly large amount of Steel selling, and the disposition among makers to turn down business offered them at prices below their ideas of the market is becoming more pronounced. We are advised of quite a number of fair sized orders placed within the past week, and the promptness with which buyers accepted prices named by makers was a pleasing revelation and would seem to indicate that the downward tendency of the market has been checked, and also that buyers are becoming impressed with the idea that now is a good time to enter the market. In addition to the sales referred to above, some Eastern buyers are said to be in the market for considerable Steel. The local plants are in full operation and all have a fair amount of orders booked. Prices continue to range from $17.60 to $17.75, according to size of order and terms of delivery. It is not believed that $17.50 would be shaded, however desirable the order. We note a sale of 500 tons for early delivery at $17.75 at maker's mill.

Plates.—Competition for business is as keen as ever, and prices have been shoved a peg lower. There is only a moderate volume of business, and there is nothing to indicate that it will be heavier in the near future. We quote as follows: Tank, 1.40¢ @ 1.50¢; Shell, 1.60¢ @ 1.70¢; Flange, 1.65¢ @ 1.75¢; Fire Box, medium quality, 2.50¢ @ 3¢; best quality, 3.50¢ @ 4¢.

Structural Material.—The approaching close of the building season is having its effect, and business has recently fallen off perceptibly. Bridge work is also slow, although there are some old orders yet to fill. Should we be favored with a return to prosperity when the building season opens next year it is certain that there will be a very heavy demand for Structural Material, owing to its very low cost. We quote as follows: Beams up to 15 inches, 1.50¢ @ 1.60¢, according to order. Angles and Universal Plates, 1.60¢ @ 1.65¢; Tees, 1.75¢.

Rails.—Makers claim that the combination price of $29 at mills is still in force. As against this we have reliable information that this price has been shaded very materially on some recent sales. The local mill continues in operation, though not to full capacity.

Ferromanganese.—We continue to quote nominally at $55 for 80 % domestic. An order placed on the market just now would shade this price.

Muck Bars.—We are advised of a sale of 500 tons for November delivery at $20.50, delivered at buyer's mill. This may be considered the ruling price in this market. Very little Muck Bar has been sold here for some time.

Wire Rods.—The market continues fairly active, there being but few prompt Rods to be had. For delivery during the next two or three months $25.50 at maker's mill would be accepted.

Bars.—There is only a fair amount of business offering, and with the mills all desirious of running as full as possible there is naturally very severe competition and prices are somewhat lower. We quote Soft Steel Bars at 1.30¢ @ 1.35¢, with Bar Iron extras. Refined Iron Bars are held at about 1.40¢ at mill, half extras.

Merchant Steel.—There is nothing new to report. Trade is only fairly satisfactory, some of the mills having considerable business while others have very little. Prices are ruling about as follows: Open Hearth Spring Steel, 1.90¢ @ 2¢; Bessemer Machinery, 1.65¢ @ 1.75¢; Toe Calk, 1.90¢ @ 2¢; Tool Steel from 5½¢ upward, according to quality.

Wire Nails.—The active condition of the market referred to in our last report continues. Prices, however, show no improvement, but on the contrary have shown a weaker tendency. While we quote at $1.25 in carload lots at mill, it can be stated that this price is being shaded to some extent. In the Cut Nail market there is nothing new to report. Mills in the Wheeling district have a fair amount of orders on their books, but could take care of considerable additional business if offered. The market is represented by the quotation $1 @ $1.05 at maker's mill for the usual averages.

Barb Wire.—There has been no improvement in demand and the present condition of this industry is unsatisfactory. While we continue to quote $2.25 for Four-Point Galvanized in carload lots, it should be noted that some recent transactions were at a slightly lower figure. We continue to quote Painted at $1.85 in carload lots, but this price is also shaded.

Connellsville Coke.—For the week ending Saturday, October 21, there were 5454 ovens in the Connellsville region in blast and 12,006 idle, with a total estimated production for the week of 48,435 tons. We can report a better demand for Foundry Coke, and prices are being maintained on the basis of $1.50 to dealers and $1.65 to consumers. Coke makers expect an early improvement in the demand for Furnace Coke, and it is the impression that higher prices will prevail on the opening of the new year. We continue to quote Furnace Coke at $1.10 in tons of 2000 pounds, f.o.b. cars in Connellsville region.

St. Louis.

(*By Telegraph.*)

Office of *The Iron Age*, Bank of Commerce Building, ST. LOUIS, November 1, 1893.

Pig Iron.—Reports of low prices are not now so frequently heard, and the impression gains ground daily that the bottom at last has been reached. We have had occasion to make this remark before, when Iron was higher, and this prediction may prove erroneous, like its predecessors, but the fact remains that statistically the market was never in better shape to respond to an increased trade, and it seems unreasonable to assume that furnaces will continue to sell at prices which they claim

Hosted by Google

net them an absolute loss. Sales during the week are about on a par with preceding weeks, and prices are practically unchanged. We quote as follows for cash, f.o.b. cars St. Louis :

Southern Coke, No. 1 Foundry	$13.25 @ $13.50
Southern Coke, No. 2 Foundry	11.50 @ 11.75
Southern Coke, No. 3 Foundry	10.75 @ 10.95
Southern Gray Forge	10.25 @ 11.50
Southern Car Wheel	17.25 @ 18.25
Lake Superior Car Wheel	16.50 @ 17.00
Ohio Softeners	16.00 @ 16.50

Bar Iron—Local jobbers report a better demand both from the city and country trade. Prices for lots from store are a trifle higher and are now quoted at 1.70¢ @ 1.75¢. Mills quote 1.45¢, half extras, f.o.b. East St. Louis.

Barb Wire.—The scarcity of Rods has prevented mills from shipping promptly, and they are now pushed to fill their orders. Texas freight rates are again lower and some large shipments are made into that section. Prices are fairly firm, as follows: Mills quote Painted at $2, terms 60 days or 2 % discount for cash Jobbers ask $2.10 for Painted and $2.45 for Galvanized.

Wire Nails.—The weakness noted in our last report continues and $1.40 in carload lots to jobbers is now freely made. Indeed, rumors are afloat of $1.35 and even $1.30 for lots of from 2000 to 3000 kegs, net cash. Jobbers quote $1.50 @ $1.55, according to quantity.

Rails and Track Supplies.— A slight improvement is noted in this department, particularly for Track Supplies. Steel Rails are inactive at $30 @ $31. Splice Bars, Spikes, Bolts, same as last reported. Old Iron Rails dull at $15.

Pig Lead.—This metal is up one day and down the next, so much so that it is almost impossible to keep track of it. Since our last report sales were made at 3.35¢, but offerings are now made for November and December delivery at 3.15¢, with a possibility of 3¢ before the week is out.

Spelter.—No change to report. We continue to quote 3.30¢, but nothing doing at this price.

Chicago.

(*By Telegraph.*)

Office of *The Iron Age*, 59 Dearborn street, } CHICAGO, November 1, 1893. }

There is a distinctly better feeling in several branches of the Iron trade, and the opinion is quite general that a recovery in business will be experienced within the coming 90 days. Inquiries are much better, and in a few instances there is a perceptible hardening in prices.

Pig Iron.—In this branch there is no improvement to be noted. The only line in which there has been an increased business is in Lake Superior Charcoal. It is believed that within the past two or three weeks a considerable quantity of Charcoal Iron has been placed with large consumers at low prices. The only transactions which have come to light are two of 1000 tons each for delivery in this vicinity at about $15.25, on which the terms of payment run until the middle of next summer, although the Iron is to be delivered immediately. Coke Iron is quiet, only one sale of any size being reported, which was 500 tons of Soft Southern. Even the carload business is not any more active than it has been. Inquiries are light. Quotations are now as follows for cash :

Lake Superior Charcoal	$15.25 @ $16.00
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.25 @ 12.75
Local Scotch	14.00 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 14.50
Southern Silvery, No. 2	@ 14.00
Southern Coke, No. 2	12.10 @ 12.35
Southern Coke, No. 3	11.35 @ 11.60
Southern, No. 1, Soft	12.10 @ 12.35
Southern, No. 2, Soft	11.35 @ 11.60
Southern Gray Forge	10.85 @ 11.10
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	18.50 @ 18.75
Jackson County Silvery	16.50 @ 17.00
Other Ohio Silvery	15 00 @ 15.50

Bars.—The lowest level in this depression seems to have been struck last week when Bar Iron was sold here at 1.35¢, half extras. Since then the market has hardened and the lowest price now quoted on local brands is 1.40¢. The valley mills are standing at 1.45¢, Chicago, and from present indications that quotation will soon be the market rate. Large season contracts are still making their appearance from time to time, and one of this class was closed during the past week at better figures than such contracts realized early in the fall. Inquiries are increasing from the general class of consumers, and carload sales are more frequent than they have been. The local mills are well supplied with business for at least two weeks, which is quite an improvement in their condition. Soft Steel Bars are quoted by most sellers at 1.52½¢ @ 1.55¢, Chicago, and transactions in this line, as well as in Bar Iron, seem to be on the increase. Jobbers report a continued good movement from stock, their best customers still being the Agricultural Implement manufacturers. Store prices remain at 1.60¢ @ 1.70¢ on Bar Iron and 1.65¢ @ 1.70¢ on Soft Steel.

Structural Material.—Revised bids are being received on the Calumet Club Building and specifications are out for a new seven-story hotel. Outside of this there are no large buildings in sight. The demand for Shapes is a little larger from the bridge works, who seem to be in the possession of more orders than for some time. Quotations are maintained at the following prices on mill shipments, Chicago delivery : Beams, 1.75¢ @ 1.90¢; Tees, 1.95¢ @ 2.05¢ ; Angles and Universal Plates, 1.75¢ @ 1.80¢.

Plates.—Inquiries are very light, but dealers are adding to their stock in anticipation of a much better trade during the winter. At present they report only a light demand from stock. Mill shipments, Chicago delivery, are now quoted as follows: Tank Steel, 1.70¢ @ 1.80¢; Shell Steel, 2¢ @ 2.10¢; Flange Steel, 2.10¢ @ 2.20¢; Fire Box, 2.75¢ @ 5.50¢. Store prices now prevail as follows: Iron or Steel Sheets, Nos. 10 to 14, 2.25¢ @ 2.40¢; Tank Steel, 2 10¢ @ 2.20¢ ; Shell Steel, 2.20¢ @ 2.40¢; Flange Steel, 2.50¢ @ 2.65¢; Boiler Tubes, 70 %.

Sheets.—The labor troubles in the Sheet mills are interfering with deliveries on contracts and jobbers find much difficulties in supplying their customers. Some of them have just about caught up with sales made during the summer for September delivery. Mill prices show no improvement, but continue to be quoted at 2.75¢, Chicago, for No. 27. Common prices from stock, however, are firmer, and small lots are now held at 3¢. Galvanized Iron is in about the same condition as Black Sheets, with deliveries from mills considerably behind the orders. Juniata Galvanized is still quoted at 75 % off for mill shipment, freight added. Copper Sheets unchanged at 35 % off.

Merchant Steel.—New business continues to come in steadily in moderate quantities, but specifications on contracts are discouragingly slow. Large Steel consumers are of the opinion that there will be a shortage of Steel in January, by which time they expect that the agricultural works will all be in full operation and all trying to get deliveries from the mills at the same time. More sales have been made of Steel Billets at $20. The demand in this direction looks very favorable. Mill shipments, Chicago delivery, are quoted as follows: Smooth Finished Machinery, Tire and Open Hearth Spring Steel at 1.90¢ @ 2¢; Ordinary Bessemer Machinery, 1.60¢ @ 1 65¢; Ordinary Bessemer Tire, 1.55¢ @ 1.60¢; Ordinary Tool Steel, 6¢ @ 7¢; Specials, 12¢ and upward.

Rails and Track Supplies.—Steel Rail manufacturers report calls for small lots only of a few hundred tons, which they were able to supply from stock on hand. A considerable proportion of such orders is for Light Rails running down to 30 lb. Standard sizes are unchanged at $30 @ $32; Light Rails to 30 lb, $31.50 @ $32; 12 lb and upward, $34.50; Iron and Steel Splice Bars, 1.50¢ @ 1 55¢; Spikes, 1.85¢ @ 1.90¢.

Old Rails and Car Wheels.— Negotiations are pending for several lots of Old Iron Rails, but no sales have transpired; in the meantime quotations are continued at $14. Considerable more business has occurred in Old Steel Rails, which are quoted at $10 for long lengths and $7.50 @ $8 for short pieces. Old Car Wheels are neglected, with holders asking $13 @ $13.50 for carload lots.

Scrap.—Old Material is moving much better than at any time since June. Every kind of Scrap is in some demand except Steel. Old Rubber is in active demand with advancing prices. Shipments of Iron and Steel Scrap are coming in more freely from the country. Holders are getting anxious to realize and in some cases are selling for but a little more than they are obliged to pay for freight. Dealers' selling prices, net ten, are as follows: No. 1 Forge, $10; No. 1 Mill, $8; Sheet Iron, $4.50; Pipes and Flues, $8 ; Axles, $16; Horseshoes, $11; Fish Plates, $13 ; Spikes and Bolts, $10; Cast Borings, $4.50; Wrought Turnings, $6.50; Axle Turnings, $8; Heavy Cast, $9 50; Stove Plate, $7.75; Malleable Cast, $8 ; Mixed Steel, $7, gross ton; Leaf Steel, $14 50. An error was made in Axle quotations last week which was so apparent that a correction is hardly necessary.

Metals.—Carload lots of Lake Copper are unchanged at 10⅜¢ and casting brands 9¾¢, with very little doing. Consumers of Pig Lead are coming in to some extent and quotations have been advanced to 3.30¢ on large lots and 3.35¢ on single carloads. Spelter seems to be a little firmer and is quoted at 3.45¢.

Samuel Yahres, for some time connected with the Sharon Steel Casting Company, Sharon, Pa., has been elected secretary and treasurer of the Pneumatic Hammer Company of Chicago.

Hosted by Google

New York.

Office of *The Iron Age*, 96-102 Reade street, NEW YORK, November 1, 1893.

Pig Iron.—Current business is light and the market is without any strengthening tendency. The last sales of Charcoal Warrant Iron, covering 200 tons, went at a shade over $9, buyer to pay storage, which makes it equivalent to about $10. The previous sales at $3 and $1 were made in the absence of any members of the Iron trade at the Real Estate Exchange. Arrangements have now been made to conduct such sales at the Metal Exchange. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2; $12.25 @ $12.50 for Gray Forge at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft. Gray Forge is $11.25 @ $12.

Spiegeleisen and Ferromanganese.—No business of any consequence has transpired. We quote: Foreign Spiegeleisen, nominally, for 10 % @ 12 %, $21.50 @ $22, and 20 % $25.50 @ $26, on cars, Jersey City, and Ferromanganese, $55 50 @ $56.

Billets and Rods.—There have been sales of round lots of Billets by Western works to Eastern mills, several thousand tons of special and common Billets being involved. The terms were private, but were not as low as some of the rumors have made them. Open Hearth Billets have sold down to $23.75 at Western mill. Small lots of foreign Special Steel have also been asked for. We quote nominally: Domestic Billets, $20.25 @ $22.50, and foreign Billets, $28 @ $28.50, tidewater; domestic Wire Rods, $28.25 @ $29, and foreign Rods, $39.50 @ $40, tidewater.

Steel Rails.—There is a growing uneasiness in the Rail trade, and indications seem to substantiate the claims that lower prices have been made at other points. In this market no sales have yet taken place to test the matter thoroughly. There is reason to believe that distant mills are making efforts to find customers in the markets tributary to the Eastern mills. The situation will probably be cleared up at an early date.

Track Material.—Small lots are selling at the following prices: Spikes, 1.80¢ @ 1.90¢; Fish Plates, 1.40¢ @ 1.60¢; Track Bolts, Square Nuts, 2.25¢ @ 2.40¢, and Hexagon Nuts, 2.40¢ @ 2.50¢, delivered. Concessions would be made for round lots.

Manufactured Iron and Steel.—The work for the Paterson City Hall has been placed, going to the mills in that locality. There has been no relief from the paucity of orders, so that current values have not been tested for some time by any specifications of consequence. As yet the prices for finished material do not appear to have followed the recent heavy decline in raw Steel. We quote nominally: Beams up to 15 inch, 1.75¢ @ 2¢; 20-inch, 2¢ @ 2.25¢, for round lots; Angles, 1.75¢ @ 1.90¢; Universal Mill Plates, 1.65¢ @ 1.90¢; Tees, 2¢ @ 2.15¢; Channels, 1.80¢ @ 2¢, on dock. Steel Plates are 1.60¢ @ 1.70¢ for Tank; 1.75¢ @ 1.90¢ for Shell; 2¢ @ 2.15¢ for Flange, and 2.50¢ @ 2.80¢ for Fire Box, on dock; Refined Bars are 1.50¢ @ 1.9¢, on dock, and Common, 1.40¢ @ 1.50¢; Soft Steel Bars are 1.50¢ @ 1.70¢; Scrap Axles are quotable at 1.70¢ @ 2¢, delivered; Steel Axles, 1.70¢ @ 1.90¢, and Links and Pins, 1.70¢ @ 1.80¢; Steel Hoops, 1.75¢ @ 1.90¢, delivered; Cotton Ties, 70¢ @ 72½¢ ℔ 45 lb bundle, at mill.

Old Material.—Old Iron Rails are nominally at $13 @ $14; Old Steel Rails, $8 @ $9, and Wrought Scrap $9 @ $11.

British Iron and Metal Markets.

[*Special Cable Dispatch to The Iron Age.*]

LONDON, WEDNESDAY, November 1, 1893.

Pig Tin prices have dropped about £2 ℔ ton during the week, prompts selling at as low at £76. 10/ on Tuesday. On the decline there has been only moderate trading in prompts, but transactions in three months' futures were quite heavy, reaching a total of several hundred tons. The sales were chiefly by operators who became alarmed over the decline in silver, unfavorable advices from the American market and very heavy shipments from the Straits. At the close the market was rather quiet; sales at £76. 17/6 for prompts and £77. 10/ for three months' futures.

Copper has averaged somewhat higher. Merchant Bars for prompt delivery sold up to £42. 15/ under the influence of better advices from America, but upon dealers taking profits there was a reaction to £42. 6/3. From the latter point there was some recovery, due chiefly to purchases for American account. Outside speculative interest is quiet and confined to moderate ventures in futures. Prices at the close were £42 @ £42. 2/6 for Merchant Bars, prompt delivery, £42. 10/ @ £42. 12/6 for three months' futures, and £46 for Best Selected English.

Tin Plate prices are still rather irregular, and some business has been done at 3 pence decline from late quotations. Demand is chiefly for moderate quantities of ordinary Cokes, and for special sizes. Stocks at Swansea have increased somewhat and are now estimated at 236,000 boxes. Liverpool quotations are as follows:

IC Charcoal, Alloway grade	12/9 @ 13/3
IC Bessemer Steel, Coke finish.	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12/
IC Coke, B. V. grade, 14 x 20	11/6 @ 11/9
Charcoal Terne, Dean grade	11/3 @ 11/6

Pig Lead has remained stationary in price, and the market is slow, with sellers at £9. 12/6 for Soft Spanish.

Spelter has met with slow sale, and the market is unchanged at £16. 15/ for ordinary Silesian.

In the various branches of the Iron and Steel trade business has continued slow, and prices, while rather weak, show no radical change. Last dealings in warrants were at 42/2 @ 42/3 for Scotch, 34/6 for Cleveland, and 44/6 for Hematite.

The furnace of the Tonawanda Iron & Steel Company, at Tonawanda, N. Y., will go into blast on the 13th inst.

Metal Market.

Copper.—Home consumers have purchased moderate quantities of Ingot through local sales agents and brokers, the aggregate of which, while problematical, seems to have been sufficient, in connection with exports on previous orders and on consignment, to prevent really burdensome accumulation of stock in first hands. The movement has sufficed to steady values a trifle. Further than that, however, it has had no particular influence aside from holding speculative offers of futures in check for the time being, since all indications are that there will be quite enough Copper to go around during the balance of the year. Lake Superior was offered in some quarters at 9¾¢, although the leading producers quote ⅛¢ @ ¼¢ above that price. On Electrolytic the range is 9¼¢ @ 9½¢, and common casting stock is 9⅛¢ @ 9⅜¢, according to brand, delivery, &c.

Pig Tin.—In the price of Straits Tin there has been a decline during the past week of about ¼¢ ℔ lb. Spot stock went as at low as 20 45¢ on Metal Exchange contracts and quite as cheaply at private sale. A month ago the spot price was 21¢, bid. In the interval there has been more or less buying to "average down," with the expectation that the restriction of importations by the McKinley duty should naturally turn the tide by November 1. The speculation, however, has proved to be one of those frequent experiences wherein buyers found it easy to purchase goods, but difficult to realize profits. Steadily declining prices in London, due chiefly to heavy shipments of Tin thence from the primary sources of supply, have doubtless had a certain unfavorable bearing, but lack of local support and absence of outside speculative demand leaves the principal holders at some disadvantage. Apropos of the movement from the Straits, it is worthy of note that 1850 tons were sent to Great Britain and 200 tons to the Continent during the last half of October, and that the total shipments for the month were 3500 tons, against 3225 tons during October last year. This would indicate that the excess in European supply more than balances the decrease in American stocks. The stock in the United States, exclusive of Pacific Coast ports, is, according to the Metal Exchange data, down to 3635 tons, against 6710 tons on August 1. Prices were a shade firmer at the close, with 20.50¢ bid for current month delivery, 20.60¢ for November and 20.70¢ @ 20.80¢ for later deliveries.

Pig Lead.—Under speculative manipulation the price for common domestic Lead was raised to 3.50¢ for November and slightly higher for more distant future deliveries. Lead came out and speculative buyers at the advance went out. Prices eased off, as a matter of course, and very few contracts changed hands at the decline. Meanwhile some business was effected quietly at 3.40¢ outside of the speculative circle and the latter price fairly reflected market value at the close for carload or large lots deliverable during the next 30 days. Consumers have been very indifferent buyers of late and their best bids at present are considerably below those made by speculators. At the end of the week actual Lead was on sale at 3.40¢, prompt shipment, in the face of speculative bids of higher prices for distant future deliveries.

Hosted by Google

Spelter.—The higher range of value established last week has been fully maintained, and surface indications are that sellers have gained some further slight advantage. In any event 3.60¢ @ 3.65¢ stand as close quotations on ordinary Western brands in carload or larger lots, and some few sales were reported at those figures. Dealings in this quarter have been on a rather small scale, however, and the demand at present is rather slow.

Antimony.—Only a moderate business is passing, and the market shows no decided change in any particular. On wholesale lots the quotations are about 9⅝¢ @ 9¾¢ for Hallett's, 10¢ for L. X., and 10⅛¢ @ 10¼¢ for Cookson's, in round lots.

Tin Plates.—Although somewhat irregular, the demand for Cokes for both prompt and future delivery has been fairly active, and enough business resulted to impart an air of firmness to the market. Bright Charcoals and Ternes have also met with slightly better sale, chiefly in small lots. In a few instances, where assortments are poor, prices rule a shade higher, but the general line of quotations is very similar to that which prevailed a week ago. Spot quotations are as follows: Coke Tins—Penlan grade, IC, 14 x 20, $5.35; J. B. grade, do., $5.40; Bessemer full weight, $5.35 @ $5.40; light weights, $4.95 @ $5 for 100 lb, $4.85 for 95 lb, $4.70 @ $4.75 for 90 lb. Siemens Steel scarce. Stamping Plates—Bessemer Steel, Coke finish, IC basis, $5.60; Siemens Steel, IC basis, $5.65; IX basis, $6.75 @ $7. Charcoals—Melyn grade, IC, $6.37½ @ $6.50; Crosses, $8; Allaway grade, IC, $5.60; Crosses, $6.75; Grange grade, IC, $5.75; Crosses, $6.85. Charcoal Ternes—Worcester, 14 x 20, scarce; do., 20 x 28, $11.35; M. F., 14 x 20, $7.75; do., 20 x 28, $15; Dean grade, 14 x 20, $5.30 @ $5.37½; do., 20 x 28, $10.50 @ $10.60; D. R. D. grade, 14 x 20, $5.15; do., 20 x 28, $10.10; Alyn, 14 x 20, $5.32½ @ $5.35; do., 20 x 28, $10.40; Wasters—S. T. P. grade, 14 x 20, $4.75; do., 20 x 28, $9; Abercarne grade, 14 x 20, $4.60; do., 20 x 28, $8.87½.

Mortimer H. Cort, who was connected for over 17 years with the firm of N. L. Cort & Co., has started in business at 9 Burling slip as importer and dealer in Tin Plates, Pig Tin, Sheet Iron and Zinc.

Financial.

The week under review has seen the long looked for vote in the Senate, which decrees the unconditional repeal of the Silver Purchase law. To-day the House passed the Senate bill with its amendments and all doubts are at rest. That this circumstance will have a most important bearing on the general financial situation throughout the country is undoubted. It is for this event that the business and banking communities in particular have been waiting, and it is but reasonable to expect that its consummation will be followed by a general improvement in the country's financial and industrial condition. That this improvement will be a gradual one is more than likely, as it will naturally take some time before confidence—proverbially a plant of slow growth—will recover from the rude shocks which it has received during the past months of suspense and financial stringency. It is too early yet to discover any substantial evidence of a revival in trade and commerce, but most of the requisite conditions exist for such recuperation. The banks of the country hold an abundant supply of money ready for profitable investment, and with the assurance of stability in the currency, they are now in good shape to afford the necessary accommodation to borrowers. The New York banks in particular have made enormous gains in their reserves. Last Saturday's statement of the Associated Banks displayed a gain of $9,000,000 currency through interior remittances. The surplus of reserve above legal requirements increased $6,140,000, the total now standing at nearly $49,000,000; figures which have been rarely equaled at this time of the year. The fact of such an abundance of unemployed money being available just at the time when other favorable conditions are developing is a good sign for the prospects of an active revival of business in the near future.

The outstanding Clearing House loan certificates in New York have all been canceled, and, for the first time for many weeks, mention is made of a resumption of gold imports. The sum of $1,500,000 has been secured by a New York house from London, and is now afloat. London advices state that a large withdrawal for the United States is expected in that city; and although exchange rose early in this week above a point at which it would be possible to import specie, this condition is regarded as only transitory, while it is known that much capital is waiting on the other side for a favorable time to purchase American securities.

Speculation on the Stock Exchange during the week has been most active, the market prices of nearly all securities rising at one time to a higher level than had been reached since the panic, with a large volume of business. The following statement, giving the business of the exchange for the week ended October 28, shows the remarkable impetus given to speculation by the favorable reports from Washington:

	1893.	1892.	Changes.
Stocks, shares...	2,400,065	2,247,896	Inc.. 152,069
Governments ..	$19,800	.....	Inc.. $ 19,800
State and railroad bonds...	11,714,500	$7,519,000	Inc..4,195,500
Silver certs. oz	30,000	302,000	Dec.. 312,000
Stock rights...	7,451	.....	Inc.. 7,451

The last days of the week witnessed a strong and buoyant market, with a large and well distributed volume of trading. Saturday's transactions aggregated 233,195 shares of stock and $1,126,000 of bonds, a remarkable record for a half holiday. The market closed on Saturday with the whole list of active stocks marked from 5 % to 10 % higher than on the previous Monday, the upward movement continuing to the end of business. Monday saw, however, a not unexpected reaction in speculation, which carried down the list an average of 1½ points. Erie and Union Pacific suffered in particular from well authenticated rumors that these companies would default in the payment of the November interest on their several bond issues. Tuesday's announcement of the passage of the repeal bill by the Senate failed to stimulate the stock market, which, indeed, suffered from a most decided reaction under a heavy "bear" attack, prices dropping along the whole line. This was accounted for by the fact that the action of the Senate had been already discounted and acted upon in the advance of from 10 % to 15 % that had occurred in active stocks during the previous fortnight. It was also said that many speculators had chosen the present time to sell the shares they had bought at low prices during the panic. This was also given as the reason for heavy selling orders from London, which were a marked feature of the day's business. Shrewd foreign operators who acquired stocks during the summer were believed to be intent on securing the handsome profits which have accrued since that time on their purchases. Foreign selling orders of this nature were said to have approached in value about $3,500,000. The market showed firmer, however, at the close of business. The following list shows the extreme fluctuations of the more active stocks since October 25, with closing quotations for November 1:

	Highest.	Lowest.	Closing, Nov. 1.
Am. Sugar Ref.....	105⅓	99	102¼
Atchison, T. & S. Fé....	23⅛	20¼	20⅞
Balt. & Ohio.....	77⅞	73	75⅛
Chicago Gas.....	69¾	63½	67¾
Chic., B. & Q.....	87⅝	82	84
Chic., Mil. & St. Paul...	68¾	63½	66⅝

Government bonds have been strong and unchanged, with no sales on call. Closing quotations on Wednesday were as follows:

	Bid.	Asked.
2s, 1891, registered.....	96	.....
4s, registered.....	111	112
4s, coupon.....	111	112

The movement in the railroad and miscellaneous bond market last week kept pace with that in the stock market, and nearly 100 issues showed advanced prices, dealings being very large, and over 50 % in volume above those of the corresponding week of last year. Values at the same time advanced from 5 % to 10 % in the more active issues. The general bond market was, however, less active in the early part of the present, week, with a downward tendency in prices.

Money on call has been in ample supply at 1½% @ 2 %, a number of special transactions having been made at even as low as 1 %. The demand for accommodation has not yet, however, expanded to any appreciable extent, and the market is entirely in sellers' favor. Time loans are quoted on readily marketable collateral at 3 % @ 3½ % for 30 and 60 days, 3½ % @ 4 % for three and four months, and 4½ % @ 5½ % for longer terms. Commercial paper continues in good demand by out of town banks, rates being quoted at 5 % @ 6 % for choice indorsed receivables, 6½ % @ 7 % for the next grade, and 7 % @ 8 % for choice single names having from four to six months to run.

Foreign exchange was weak and irregular up to Tuesday, with an increase in the volume of cotton bills offered. On that day, however, the market for sterling stiffened appreciably, notwith-

Hosted by Google

standing the Senate's action, and bills were in sharp demand against heavy sellings of stocks for London account. Offerings of cotton bills were also lighter. On Wednesday rates were reduced. Actual rates for sterling were quoted at the close as follows: 60 days', $4.80½; demand, $4.83½; cables, $4.83¾ @ $4.84; commercial, $4 79½ @ 4.79¾.

Domestic exchange on New York is quoted as follows: New Orleans, commercial 200 @ 250 discount, bank par; Charleston, buying ⅛ discount, selling par; San Francisco, sight 15, telegraph 20 premium; Savannah, buying ⅛ discount, selling ¼ discount @ par; Chicago, 75 premium; St. Louis, 60 premium. Boston, 15¢ @ 17¢ discount.

Silver continues to decline, the London price for bars being down to 31½ pence ℔ ounce, and in New York 68½¢ ℔ ounce. The latest purchases at the Treasury Department were made at 70¢ ℔ ounce, being a decline of 4½¢ from the price paid for Silver on the first purchase day of October. A large amount of silver has been exported during the week.

The anthracite coal trade shows steady improvement; the output, amounting to about 1,000,000 tons per week, being regularly absorbed. The total amount of anthracite coal sent to market for the week ending October 21, as reported by the several carrying companies, was 1,034,086 tons, compared with 869,105 tons in the corresponding week of last year, an increase of 164,981 tons, and for the year to that date the total tonnage has been 34,264,530 tons, compared with 33,394,150 tons in the corresponding period of 1892, an increase of 870,380 tons

The M. C. Bullock Mfg. Company.

The main exhibit of the M. C. Bullock Mfg. Company, in the southeast central section of the Mines and Mining Building, occupied a space of 45 x 47 feet. These exhibitors applied for a much larger space, intending to exhibit several of their newest designs of transfer and underground rope haulage plants, large geared and first motion plants of the conical drum type, like the various plants which they have furnished the great Chapin Mine, and also a pair of tandem compound Bullock-Corliss engines, operating first motion flat rope reels, similar to the plant which they furnished to the famous Huanchaca Mine of Bolivia, the largest silver mine in the world.

Standing in the center of their space was a fine sample of their sectional portable steel derrick tower, triangular in shape, 16 feet wide at the base, while the apex carrying and supporting the sheave towers 52 feet high in the air. This company are the sole manufacturers of these towers, which were designed and brought out by them to send to tropical countries where the ravages of the weather and insects destroy timber so rapidly that the ordinary timber derrick is both costly and dangerous.

The company showed eight different sizes and styles of diamond pointed prospecting core drills, ranging from their small machines for light prospecting, boring holes to a depth of 300 feet, to their regular sizes of prospecting machines capable of boring holes to depths of 1000 feet to 2500 feet, and to their larger size, the Favorite, which has capacity to bore to a depth of 3000 feet. They also showed one of their new Giant drills, the most powerful diamond drill ever built, and which they will guarantee to bore a hole 1 mile deep. The president of the company, Milan C. Bullock, was the pioneer of this valuable mining appliance, which is and has been such a boon to prospectors and mining engineers in all parts of the world. In passing it may be of interest to state that the first diamond drill was invented by an eminent French engineer, Rudolph Leschot, for use in driving the Mont Cenis tunnel. His idea of arranging and securing the diamonds so as to retain them in the steel setting was complete, and was in itself a great invention, but his lack of combined practical knowledge of mechanics and mining prevented his making practical working machines which could be successfully introduced for prospecting purposes.

Space will not permit a detailed description of all varieties of the Bullock diamond drill, but the following outlines may be interesting to the reader: Their little hand power drill, the Bravo or prospector's friend, for surface or inside prospecting will bore a hole 1⅓ inches in diameter to a depth of 350 feet, taking out a solid cylindrical core $\frac{15}{16}$ inch in diameter, showing an exact cross section of all strata penetrated. The machine is so portable that it can be readily divided into 20-pound packages for transportation by men or muleback.

The Badger is a new type of machine especially adapted to underground prospecting. It is mounted on columns fitted with extension screws and is designed especially for drilling holes to distances of 500 feet ahead of proposed developments. Its single cylinder engine, designed for use either of steam or compressed air, is of the trunk type with patent valve, readily reversed. The feed screw and feed gears are carried in a hinged swivel head, allowing them to be swung back out of the way while removing and returning the drill rods to the hole. The weight of the machine on columns is but 585 pounds, which can be divided into 50-pound packages for muleback transportation.

The Beacon drill is also of new design, especially adapted for light underground work. It is provided with Bullock-Brotherhood three-cylinder engine, with large ports to prevent freezing when using compressed air, its working parts balanced and arranged to run at a high rotative speed. The feed screw and feed gears are carried in a hinged swivel head which is inclosed to prevent injury to the working parts and for the protection of the operator when working in confined localities. The feed gears are so arranged that the rate of advance or reverse (running back the screw) can be changed while the machine is running by simply moving one lever. The Beacon drill will bore a 1⅜-inch hole, taking out a $\frac{15}{16}$ inch core to a depth of 650 feet. It weighs but 530 pounds and can be divided into packages of 50 pounds or less.

The Beauty drill was designed to meet the demand for a light, strong, compact, durable and economical drill, which could be used either on the surface or underground. This machine is driven by a pair of their standard type of trunk engines. It is very compact and light running, and the moving parts are so well balanced that it will run from 1000 to 1500 revolutions per minute without any undue vibration. The valves, ports and passages are short and direct, adapted for use either of steam or compressed air. The swivel head is mounted upon their patent hinged swivel plate, allowing holes to be bored at any desired angle, and can be opened out from the line of holes to facilitate the manipulation of the rods. It is manufactured as a column drill with elevating reel for adjusting to the required hight for work inside of mines, and presents an appearance similar to the Beacon, and can be used either upon bed plate or columns, as desired. This drill is fitted with a hoisting drum capable of handling the required amount of rods, and when mounted on its bed plate weighs only 490 pounds, occupying a space 20 inches square, and can readily be divided into packages weighing not over 75 pounds each. The Beauty bores a 1⅜-inch hole, taking out a core $\frac{15}{16}$ inch in diameter to a depth of 800 feet.

The Crescent is a neat, compact machine, somewhat similar in design to the Dauntless, having its hoisting drum and gearing underneath the crank shaft, arranged to be thrown into and out of gear very readily by the movement of one lever. It is also provided with a brake attachment for lowering long lines of heavy rods. This machine is provided with an improved double cylinder type of hydraulic feed, the cross head being provided with a steel guide, which not only steadies the driving of the spindle, but can also be graduated to show the degree of speed at which the bit is penetrating the rock. The Crescent will bore a hole 1¾ inches in diameter, taking out a $1\frac{3}{16}$-inch core, to a depth of 800 feet.

The Champion is the smallest drill fitted with Bullock's thrust register, and will bore a 1¼-inch hole, taking out a $1\frac{3}{16}$-inch core, to a depth of 1500 feet. The machine weighs only 1200 pounds and can be divided into 100-pound packages for mountain transportation. One of these machines has bored over 100,000 feet of hole and is still in use.

The Dauntless is powerful, durable and economical; is fitted with the patent thrust register and other improvements, and will bore a hole 2 inches in diameter, taking out a $1\frac{7}{16}$-inch core to a depth of 2000 feet. In June, 1893 one of the Dauntless drills completed a 2-inch bore hole at a depth of 2500 feet (the deepest 2-inch hole ever bored), on the Rand-Victoria gold mines at Johannesburg, South Africa, cutting at a depth of 2397 feet a solid blanket vein 5 feet 8 inches wide, carrying a high percentage of visible gold.

The Favorite is one of the latest designs. It is fitted with thrust register, reversible engines and double hoisting drums adapted to handle rapidly and safely long lines of heavy drill rods or casing. It is also fitted with the new device for removing cores from the bottom of deep holes without the loss of time and the labor required for withdrawing and removing the bit and rods and again returning them to the bottom of the hole. For instance, it required ten hours of hard labor for a gang of men to hoist out and return to the bottom of the hole a line of rods 2000 feet long, while with this new apparatus the operators have frequently removed cores from the bottom of holes ranging from 1800 to 2400 feet in depth in 20 to 40 minutes, which covered full time of stopping. The improvement not only effects a saving of time in handling the rods in deep hole prospecting or well boring, but what is of equal importance is the fact that this method of rapid drilling and withdrawal of the cores permits prospecting of the swelling or caving ground which is frequently encountered in the soft coal measures. Among the great number of holes which have been bored with it are three, as follows: One reaching a

Hosted by Google

depth of 2006 feet 4 inches, another reaching a depth of 2401 feet 10 inches and another reaching a depth of 2463 feet.

The Giant is the largest diamond drill ever built; it is powerful enough to drill holes varying from 8 inches to 14 inches in diameter to a depth of one mile, and is especially designed for very deep hole prospecting or well boring. It handles a long heavy line of casing, rotating it to the left while at the same time the regular boring tools are as rapidly rotating to the right, boring ahead of the casing. The machine is so arranged that by the movement of a single lever the feed can be stopped, while both the lines of drill rods and casing are kept rotating in opposite directions. Or, if desired, the machine can be put to "jacking up" all of the boring tools, or the casing or the boring tools can be "jacked up" separately, and the machine is so powerful that it will lift 40 tons at the rate of 12 feet per minute. This arrangement is valuable in prospecting in loose, swelling or caving ground. On the upper cross head is carried a pair of the patent thrust registers, one of them showing the weight of the rods, while the other registers the pressure on the face of the bit against the rock, showing accurately all changes of measures the instant they occur, and their distance from the surface. The lower cross head carries a similar register gauge which indicates the condition of the casing bit, when the casing becomes clogged by caving ground, &c.

The exhibitors also showed a small air compressing plant consisting of a 6 horse-power Simplex gas engine belted to a 7 x 7 inch water jacketed air compressor. This engine is a new claimant for honors in America. It was invented in France by M. Delamare Debouteville and M. Malandin, and is being manufactured there in large numbers. It receives one impulse for every other revolution, like other successful gas engines. It has a very simple yet sensitive form of governor, and it will regulate so accurately that it is used extensively for driving electric lighting plants. The charge is fired by electricity, which permits the use of fuel gas of very low illuminating power. In fact, the fuel gas produced by the Lencauchez process "from meager coals" (and which is successfully used with the Simplex gas engine) is so poor in illuminating qualities that it cannot be fired by the ordinary "torch" or incandescent tube used on the English and German gas engines. The arrangement of the valves, firing device and primary battery for furnishing the spark is simple and economical in its action. The larger types of engines are supplied with self starters.

The M. C. Bullock Mfg. Company make a new percussion rock drill, the Monarch. The drill can be operated either by steam or compressed air; it is simple, compact and easily handled. Various sizes of these drills are made, mounted for different classes of quarry and mining work. The patent quarry bars, tunnel columns, shaft bars and adjustable tripods contain many new and novel points of excellence which will readily commend them to the practical quarryman or miner. The following outline covers a few (only) of the special claims for excellence and superiority which the manufacturers make for these drills :

1. The piston strikes an uncushioned blow on the rock.

2. While the recovery is very rapid it is impossible for the piston to strike the back head, for at a certain point of the inward stroke live steam or air at full pressure is admitted behind the piston, thus forming by compression a live cushion which not only receives and arrests the momentum, but starts the piston on its forward stroke with a greater force than that due to the initial pressure of steam.

3. The drill has only two reciprocating parts, the piston and the valve, and the weight of metal is so judiciously distributed that breakage is rare and the cost of repairs is reduced.

4. The drills are all manufactured by the use of jigs and templates, so that all parts are interchangeable, which is of great value to purchasers.

The band friction hoists are built with double engines connected at right angles to the driving shaft, to which is keyed a steel pinion shrouded on both sides for strength; the pinion drives a spur gear which is keyed fast to the drum shaft. The drum is loose on the shaft, the bearing being lined with hard brass bushes to insure longevity and a ready means of repair. The drum is driven by Lane's band friction clutch, which enables the operator to have control of the starting, stopping and lowering of the load without reversing and while the engines are running at full speed. The drum is provided with a powerful band brake for lowering the load without running the engines. Both hoisting and lowering are controlled by the single movement of a hand wheel, which automatically loosens the brake band while tightening the driving band, thus simplifying the manipulation of the machine and diminishing the liability to accident caused by the operator losing his presence of mind. The load may be started gradually, without shock or jar, while the engine is running at full speed, thus bringing the full power of the engine to act on the load in starting it from the bottom, and when the load has reached the top the steam may be shut off, and by one turn of the hand wheel the drum is released and the empty car, bucket, skip or cage is lowered quickly, but under control.

PERSONAL.

James P. Witherow of Pittsburgh sailed for Europe last week.

Sir Henry Wood, secretary of the British World's Fair Commission, has returned to England.

Daniel Adamson of Hyde was a recent visitor in New York.

The statement has been made that low prices for certain grades of pig iron necessarily prove that the metal is being sold below cost of production. It does not follow that because a Southern furnace is selling gray forge at $6.50 when the cost is $7.50 that the plant must be losing money. Let it be assumed that a furnace is making pig iron at that figure and that it is producing, say, equal quantities of gray forge, No. 2, and No. 1 foundry. If the furnace is getting $7.50 for No. 2 and $8.50 for No. 1, it is evidently selling its whole product at an average of $7.50, or at cost, even though there may be an apparent loss of $1 per ton on its sales of gray forge. While our figures are, of course, only chosen by way of illustration, we do believe that there are cases where they are not far out of the way.

Patent and Trade-Mark Laws.

A committee of the Patent and Trade-Mark Congress having had the subject of formulating resolutions before them, reported as follows:

One of the rules under which auxiliary congresses are held is that no resolutions shall be passed relating to controverted matters. We have, therefore, confined those here presented to such matters as seemed to us to have the consensus of all of the opinions which have been heretofore expressed, without attempting to cover many of the valuable suggestions made.

Resolved, By this congress, assembled under the auspices of the World's Congress Auxiliary of the World's Columbian Exposition, for the purpose of considering inventions and trade-marks, and the various systems and laws relating thereto :

1. That for the purpose of encouraging improvements in the useful arts; the development of new industries; and to make it an object for inventors or licensed manufacturers to practically put inventions into operation, a sufficient protection should be given to them to warrant such an undertaking.

2. That as steam and electricity have brought all civilized nations near to each other, some practically uniform international system of granting patents should be adopted under which all of the patents of these several nations may be issued.

3. That some international system for repatenting or registering patents should be adopted by the several nations granting them, whereby patents granted in one country may be made effective in each of the others without burdensome fees, taxes or annuities.

4. That a requirement of working or of putting the invention into use within a stated time is an onerous condition which leads to the non-patenting and to a consequent non-use of inventions which require extensive plants or machinery, and that it is a condition which retards the introduction of inventions in the countries requiring it.

5. That all patents should for their duration be independent of patents for the same invention in other countries and be granted for the same term as that allowed by law for patents in the country granting them, and with no further restrictions than that the applications therefor be limited to the time fixed for applications by citizens and the date of grant antedating that of the oldest prior patent.

6. That a trade-mark valid in one country should be valid the world over to the first user, except only when antagonistic to local laws as to good morals.

7. That priority in the matter of trade-marks should be referred to the time of the commencement of a continuous user, and not to the date of a registration.

8. That a mark connected with a false indication of origin should be considered contrary to good morals.

9. That a committee of five be appointed by the president of this congress charged with the duty of bringing these resolutions before the Congress of the United states and the legislatures of other countries, as well as any future conference under the convention for the Protection of Industrial Property concluded at Paris, March 20, 1883, and to take such steps as they shall deem

Hosted by Google

proper to perpetuate this congress as a body for the amelioration of patent and trade-mark laws in their international relations; that this committee have power to fill vacancies and to add to their number members from each country desiring to aid in these enterprises. L. L. Bond, J. M. Thacher, James Buchanan, R. J. Gatling, Francis Forbes, committee.

The committee also reported the following as proposed by Dr. Carl Pieper of Germany: That the culpability of dishonest competition should be universally established and efficiently enforced on the wide field of industrial property. This was also adopted.

The Evolution of the Nail.

The first nails produced in the United States were made by hand, and Fisher Ames of Massachusetts, in a speech made before Congress in 1789, when it was proposed to put a duty of a cent a pound upon all imported spikes, nails, tacks and brads, in order to foster the home product, said of this industry: "It has become common for the country people in Massachusetts to erect small forges in their chimney corners, and in winter and on evenings when little other work can be done, great quantities of nails are made, even by children. These people take the rod iron of the merchant and return him the nails; and in consequence of this easy mode of barter, the manufacture is prodigiously great. This business might be prosecuted in a similar manner in every State exerting equal industry."

In August, 1797, Samuel Briggs of Philadelphia, in connection with his son, is said to have received the first patent for a nail making machine ever issued by the United States, but as at about the same time several inventions for manufacturing nails were made by various persons in different parts of the country, it is still a somewhat disputed point to whom the credit of absolute priority is due.

In 1817 the device known as the Blanchard machine, an invention of Thomas Blanchard and others of Boston, was successfully demonstrated in practical use, and the patent sold to a company for the comparatively small sum of $5000. This Blanchard machine was intended particularly for small nails, brads and tacks, and is the basis of the inventions which are in use to-day.

It is a curious contrast presented by the contemplation of a family engaged at odd hours in their home laboriously shaping nails by hand a century ago and the product of a single day of any one of the many nail and tack factories in States which were then an unknown wilderness, or inhabited by wild animals and wilder Indians.

Fifty millions of small nails and tacks is the daily output of several of these factories, weighing in the aggregate a dozen tons or more, and distributed in all the markets of the world. A single machine is capable of cutting and heading over 15,000 tacks an hour, and shoe nails are cut at the rate of 2000 a minute.

It is not many years since it was the custom in many wholesale houses to keep the boys employed in idle moments picking up and straightening out stray nails which had been removed from packing cases. The wire nail, which in its present form is a comparatively recent invention, has from its convenience and lesser cost so completely superseded the finishing nail and patent cut brad that there is little demand for these one time favorites.

Test of Fire-Resisting Materials.

A rather curious and instructive experiment was carried out in Berlin not very long ago, some account of which may prove interesting to our readers. An old building, which was to be removed to make way for new constructions, was secured, and a competitive test of fire-resisting materials instituted. Of course it was impracticable to rebuild the house with real fire proof construction, but in Germany, as here, there are many manufacturers of materials for building fire proof partitions, or for protecting ordinary wooden construction against fire, and the architects and fire engineers who instituted the test thought, with justice, that a thorough trial of these was of great importance, and that the opportunity of making it should not be neglected. In order to make the test conform as closely as possible to the conditions likely to be met with in practice, the different rooms were fitted up in various ways. Several were left as simple living rooms, with such furniture as would be found in ordinary dwellings; one was fitted up as a furniture manufactory, another as a drug store, a third as a molding mill, a fourth as a storage room for furniture and two others as petroleum stores. The rooms were then assigned to the manufacturers who wished to compete for them to protect according to their systems. In order to make the test as comprehensive as possible, however, the manufacturers were required to protect various pieces of iron work by their own systems, and in some cases, where there was a doubt as to the capacity of the fire-proofing material for enduring a sudden shock, heavy weights of iron were supported above them by light wooden frames, so that on the burning of the frames the weights would fall. Arrangements were made for extinguishing the fires both by hydrant streams and hose from a steam fire engine, so as to test the resistance of the various materials to sudden cooling and to the violent impact of the engine stream, and, with the scientific thoroughness characteristic of the Germans, a set of pieces of different substances, made for the purpose and fusible at known temperatures, was placed in each room, so that the temperature produced by the fire would be registered.

JURY OF EXPERTS.

A jury of experts was appointed, and a large company of architects, fire engineers, builders and scientific men was invited to witness the test. As this lasted several days, the rooms being separately set afire and extinguished, a restaurant in the neighborhood was engaged for the use of the guests, and there the manufacturers displayed drawings and models of their systems, while the preliminary discourse, by the veteran Herr Stude, the Director of the Berlin fire service, was given, and the decisions of the jury announced, in the same place. According to the admirable description in the *Deutsche Bauzeitung*, from which we can only borrow the most important particulars, says the *American Architect and Building News*, it appears that the fire was first set in an upper chamber, which had been treated by an exhibitor from Breslau, a carpenter named Schubert. The novel portion of Herr Schubert's construction consisted in plastering on a network of square wooden rods, interwoven with wire. Plastering in Germany is usually done on reeds, instead of wooden lath, so that the Schubert construction was particularly interesting to the company, and, as his square laths were set with the edge toward the front, he secured a good key, besides protecting a larger part of the surface of the laths than is usual with wooden lathing. In the room tested this sort of lathing was applied in various ways. The old walls and the underside of the rafters were covered with it, and plastered; a partition was made of two thicknesses of it, the laths of the two thicknesses crossing, and plastered on both sides; another partition was made of two thicknesses, but on studding, and the space between filled with slag, and a floor was laid with it and covered with cement, the ceiling under being lathed in the same way, and plastered, while a deafening of earth, in the ordinary German manner, was put between the beams. After the fire was extinguished it was found that, although the temperature, as shown by the fusible standards, had exceeded 1000° C., which is about the melting point of cast iron, the plastering on the Schubert laths showed only unimportant cracks. Where the laths were exposed in these places they were charred, but the mortar at the back of the charred laths was uninjured. The floor of cement on lath was in good condition, and water tight. Besides this construction, however, Herr Schubert showed other devices of a less simple and sensible sort. Among these was a door, consisting of a single sheet of magnesite, applied on a double layer of jute fabric. This door, although it was very small, being only 2 feet wide and less than 6 feet high, had warped under the heat so as to allow the fire to pass through the opening into the next room and patches of the magnesite had scaled off. He had also treated the wooden stairs by soaking them for two weeks with brine and then covering them with asbestos linoleum, a process which the *Deutsche Bauzeitung* calls an "excuse for protection, very disproportionate to the object sought," while it describes the appearance of the staircase as "anything but pleasing."

ONE OF THE MATERIALS TESTED.

The next exhibitor showed a material which reminds one strongly of the so-called "fire proof" materials to which the attention of architects here is frequently called. This substance was a linen canvas, made "fire proof" by impregnation with some mineral salt, and water proof by painting, and represented to be desirable for protecting wood work, covering roofs and laying over floors. According to the report of the jury, who watched its behavior, this valuable material "immediately blazed up" as soon as it was touched by the fire, and, so far as they could see, it presented "no noticeable resistance to fire," although they thought it possible that, being freshly painted, it might not have done so well in this instance as it would under more favorable circumstances. Next to the linen canvas fire proofing came a system of covering with plates of cement-concrete, which was applied to walls, ceilings and floors in one of the rooms, as well as to iron beams; while a partition was built up through the middle of the house, consisting of two thicknesses of it, with an air space between. Although the heat in the room exceeded 1000°, the cement plates resisted admirably. Here and there the cement was slightly cracked, but the wood and iron under it was perfectly protected, the iron beams showing no loss of strength in testing subsequently. The report of the jury pronounced this system, known in Germany as "Boklen's construction" to be "thoroughly fire proof," so far as the results of the test showed.

Sewer pipe manufacturers of the Ohio Valley will, it is stated, form a combination.

HARDWARE.

Condition of Trade.

OCTOBER BUSINESS was on the whole somewhat disappointing, having failed to come up to the more sanguine expectations of many in the trade. The month opened well, with an evident increase in the volume of business, but this increased demand fell off, and the trade of the month as a whole was only moderate, covering in nearly all cases such goods only as were imperatively required. The delay in repealing the purchasing clause of the Sherman bill is generally regarded as the cause of not a little of the curtailment of business, and now that repeal may be regarded as consummated it is anticipated that there will be the return of a more confident feeling, which will be followed, it is hoped, by a steady improvement. The business of the past month was thus considerably less than that of the average October, and fell still further behind that of last year, which was especially good. A similar comparison might be made between the four months of the current half year and the corresponding time of other years. A somewhat extended inquiry among manufacturers in regard to the way in which the business of July, August and September of this year compares with last year develops a wide diversity, all, however, agreeing that this year there has been a very material falling off in the volume of trade. Some manufacturers refer to this year's business in the three months mentioned as being about half of last year's, and in a few cases this year's proportion is still smaller. Other manufacturers advise us that their business this year is as much as 70 or 75 per cent. of last year's, but so large a proportion is not reported by any considerable number. An average figure for the business of Hardware manufacturers during July, August and September of this year, as compared with the same months of 1892, would be probably not far from 60 or 65 per cent. The amount of business of different manufacturers naturally varies largely with the character of the goods and the class of trade to whom their goods are principally sold. It is the general experience of manufacturers who sell the bulk of their goods to a few large houses that the falling off in this year's trade has been exceptionally heavy, while those who sell to a larger number of customers, including the retail trade and the smaller jobbers, have had a business more nearly normal.

There is little to report in regard to prices except the somewhat lower figures which are ruling on Wire and Cut Nails and Barb Wire, as referred to more fully in the following columns. The tone of the market, however, is not so strong as it has been, and in other lines concessions are made more freely. Some of the leading jobbing houses are also cutting prices with a view to effecting sales and thus lightening their at present not over heavy stock. Some manufacturers, also with a view to securing orders, are yielding somewhat in the matter of prices, but on the whole a conservative disposition prevails among manufacturers and prevents them from seeking business at unprofitable prices. A reduction in the price of raw material in some lines, with lower wages, enables them, however, to produce some goods at a slightly diminished cost. The production of goods in nearly all lines is largely curtailed, manufacturers avoiding the accumulation of stocks, and throughout the country, in the hands of both the wholesale and retail trade, stocks are unquestionably much lighter than usual. When the demand for goods is again vigorous there will probably be difficulty in obtaining them. Much less complaint is made of late in regard to collections, and the financial condition appears to be constantly improving.

Chicago.

(By Telegraph.)

Shelf Hardware jobbers report their trade very dull. The demand for season goods is over for the time, and orders now being received are for general Hardware, but in only very small lots. The country merchants are buying merely what they are absolutely compelled to take, and are keeping their stocks as low as possible. They report that they are cutting down their credits as much as they can, and keeping themselves in good financial shape for what they fear is a period of decided dullness. Jobbers here are inclined to the opinion that the coming two months will be productive of very little business in Shelf Hardware. A great deal more is doing in Heavy Hardware, but mainly in the line of Iron and Steel to the implement manufacturers. The wagon and carriage builders are still doing very little or nothing.

St. Louis.

(By Telegraph.)

There is a gradual improvement in the demand for Hardware, more particularly for shelf goods. A few straggling orders for Builders' Hardware are also received, and a general assortment of winter goods are found in orders now coming in. The general opinion is now current, based on the absolute certainty of repeal, that a largely increased trade will be in order after the turn of the year. One of the largest jobbing houses has just sent out specifications for goods, the delivery of which in former years commenced in January, but which now call for delivery commencing with December and a guarantee that the shipments will be made according to contract. This is a strong indication that this house at least are firm believers in better times in the very near future. Prices are inclined to be a trifle firmer, and some considerable improvement is expected in this direction as the demand continues to improve.

Boston.

BIGELOW & DOWSE.—The Hardware trade is comparatively busy, but no one claims that the volume is as large as it should be at this season. As no one expects it every one is happy in the thought that he is in good company. Dealers' stocks are light and orders from retailers cover the whole line. Outside of a few staple goods prices are being well sustained. Prices of both Steel Cut and Wire Nails are lower. Cordage, Carriage and Machine Bolts and Lag Screws are lower. What the effect of the repeal of the silver clause of the Sherman bill will be no one is willing to prophesy, but all seem to agree that if the Senate had been as prompt in its action as the House every one would have been benefited, but that it is too late now to help trade this fall.

The ease in the money market must help trade in the future. It is helping the remittances now. The indebtedness of the Hardware trade is less now than it has been for a series of years and it is not thought that there will be many failures this fall.

Baltimore.

CARLIN & FULTON.—Stimulated by cool weather, trade seems more active than when we last wrote, and orders, though not large, are more numerous. Seasonable goods are moving fairly well, and with the recollection of last winter's experience with Skates there is a disposition this year not to wait until the last moment to purchase that line, but to exercise a little faith in the probabilities of ice and snow during the coming winter.

Our travelers in the cotton States report a scarcity of goods in the hands of the retailers, but at the present time they are more interested in marketing the cotton crop and in making collections than in buying goods, and in fact there is never much business done in that section at this time of the year.

It will take some time yet for the trade to recover from the paralysis caused by the action of the United States Senate, but there will undoubtedly be a reaction in the not distant future.

Omaha.

LEE-CLARKE-ANDREESEN HARDWARE COMPANY.—The improvement in the volume of business noted in our previous report still continues. Although orders are not large the aggregate is augmented by the excessive number received daily.

October closes with a record fully up to the same month two years since. It could not be expected to rival October, 1892. Dealers, of course, are not buying with the freedom that formerly characterized their purchases, and economy is more popular just now than extravagance.

Stocks of all kinds are kept down to lowest possible limit, and it is a matter of surprise that the total volume of business should be as large as it is, taking all the drawbacks into consideration.

Collections are strongly inclined to drag, and complaint of the slowness of the country in meeting obligations is frequently heard.

The tremendous draft that the World's Fair has made upon this country is about exhausted, and the immense sums of money left in Chicago by Western visitors, it may be assumed, will return before long, and business must soon feel the effect of the restoration of the natural order of things.

Portland, Ore.

CORBETT, FAILING & ROBERTSON.—With a favorable change in the weather one's ideas of the future are likely to rise with the barometer. In Eastern Oregon and Washington the harvesting machinery is again at work. Should the good weather continue for a month undoubtedly a large amount of grain will be saved that was looked on as lost. The outlook, however, for an increase in business has not improved since our last. While better weather may help some to make payments on accounts now too large and long past due, there will be a necessity of carrying over to the fall of 1894 many that have been expected to pay up sure this fall.

The news of the probable repeal of the Sherman bill that has just reached us gives general satisfaction. Of late it has been hard to find silver men. Many that were for free coinage do not even stop at bimetallism, but go to the extreme of gold only. The curtailment in credits and locking up of money has taught them the evil of their ways where argument only failed to reach them.

St. Paul.

FARWELL, OZMUN, KIRK & CO.—There are but few items of special interest to the trade to report. Business is moving along in about the usual current, to which we have grown accustomed this year. There is considerable demand for seasonable goods, and also some trade in the general line of shelf goods, but the volume of trade is considerably less than that of the corresponding time last year, and jobbers have accepted the situation and have adapted themselves to it to the fullest extent possible. Retail dealers have bought so sparingly for some months past that their stocks are very low, and they are obliged to send in orders more frequently, thus increasing the number of orders, but the amount of sales is, as stated, considerably below those of '92.

Prices have been fairly well maintained in almost all lines of goods; the only special exception being that of Ammunition, which, for some reason, seems to have become somewhat demoralized. It is remarkable that this should occur, as orders for Ammunition have been filled sparingly and quite unsatisfactorily, and jobbers have been more or less out of stock all the while. Still it is a fact that some houses are cutting prices on Ammunition and this is not confined alone to the goods made by those houses whose reputation as to the quality of the goods has not been of the foremost. What the result will be the future alone will determine.

Collections are up to expectations. They might be better, and, again, they might have been considerably poorer. If wheat were bringing 15 cents per bushel higher price trade and collections would be both decidedly improved, but thus far there does not seem much hope of advance at an early date.

Louisville.

W. B. BELKNAP & CO.—A fair volume of business is maintained, based on the barest necessities of consumption. The amount of purchasing is more than usually limited, inasmuch as prices show especial strength, or at least not any tendency toward reaction from their very low level.

There is not an overplentiful supply of goods. It is difficult really to get an assorted order filled at the factory with any degree of promptness.

There is still a marked scarcity of Ammunition and Loaded Shells—factories claim to be several weeks behind in orders, and delayed shipments would confirm this.

Continued low water in the Ohio River has thrown all of the Wheeling and Pittsburgh tonnage, which often comes by river, on to the railroads. This freight with the unusual passenger travel has conspired to keep the railroads tolerably busy, although many of them are showing a heavy decrease in earnings.

A firm belief in the ultimate triumph of repeal in the Senate is the only thing which has given business any life at all. The success of the measure is now fully discounted. The accumulation of money in the various financial institutions (which is noticable here as elsewhere) is doing us very little good until there is a willingness to lend it out on reasonable security. The shrinkage in values and general liquidation have been something extremely unpleasant to reflect on. Possibly it may delight us at some future date to remember these things, but that possibility seems so very remote that it can hardly be taken into account.

Philadelphia.

SUPPLEE HARDWARE COMPANY.—If there has been any change in the volume of trade since our last letter it can be safely said that it is on the side of improvement over the preceding two weeks. Orders have been more frequent and covered a greater line of goods, although in the aggregate they will in no way compare favorably with the trade of one year ago.

We fear in many cases customers have lost their aggressive ambition which existed one year ago; otherwise the hopeful signs as seen in the blue skies at a distance would inspire them with greater confidence for the future.

Credits are scrutinized more carefully than one year ago, especially with the class of trade who were unfavorably located, or who have heretofore been looked upon as "chronic slow pay."

A little incident quite appropriate to the occasion is told by a traveling salesman. While discussing the financial stringency with a customer the customer stated: "Well, I simply at present cannot pay my merchandise accounts as they fall due. My creditors must wait." Said the salesman, "Why, this is a perfect picnic for you. You never did pay your bills promptly. You now have a reasonable excuse, while before it was a chronic disease with you."

We fancy all houses have had some similiar experiences during the last four months. Fortunately, however, a large portion of the trade have a higher regard for their credit, and, under ordinary trade conditions, so systematically manage their business and so watch their maturing accounts that it is unusual for them to be behind in their payments; but, as a rule, we find it is always wise to deal cautiously with a customer who "becomes mad" when one asks for his just dues.

The country has had great occasion and necessity during the last five months to practice what is first impressed upon them in early youth: "Faith, Hope and Charity, and the greatest of these is Charity."

The shock given to our finances some months ago entered the vitals of our banking institutions and trust companies, as well as savings banks, where the mechanic, farmer and wage earner had deposited their slim savings. It closed the doors of hundreds of banks, which resulted in business failures unprecedented, and further extended into the Government's old vaults, and affected our revenue receipts, so that our gold reserve has been largely encroached upon, and the receipts are

Hosted by Google

running behind daily expenditures; industrial enterprises became embarrassed; manufacturers closed their doors, throwing millions of people out of employment, and have compelled many thousands to ask assistance even for their daily bread.

Never was there a time when the country needed more quick and active legislation, in order to quiet the nerves of a diseased nation, yet never has there been shown in the Halls of Congress such partisan insincerity, such calm insolence, total disregard for the welfare of the nation, such insulting indifference to the strong appeals, not only from the President himself, but from 1500 mercantile and trade organizations, non-political Boards of Trade, political organizations (both Democratic and Republican), from manufacturers and jobbers, from merchants (both wholesale and retail), mechanics and farmers. North, South, East and West have all joined in the pressing demand for relief.

No stronger demonstration or evidence of what a majority of the American people desire could possibly have been furnished. Besides this the millions of unemployed throughout manufacturing districts, and the cry from the throats of many thousand hungry wives and children, with the possibility of families being turned from their homes because they could not pay their rent, have had no effect upon those Senators who were sent to Congress to legislate intelligently for the welfare of 65,000,000 of people.

The assumption that the representatives from seven silver mining States, showing a population at the last census of less than 1,000,000, as against 65,000,000 (population of the United States), have controlled the action of the Senate, is misleading. It has been the undercurrent of those Senators unfavorable to repeal, who at heart desired free coinage, while on the surface they favored repeal, who encouraged Senators from the silver mining States in this prolonged struggle.

The comparison of our Senate with the House of Lords, as made by some of our papers, places the thing entirely too mildly. There has not been a time during the last half a century when the House of Lords would dare ignore such demands of the people as have been made upon our Senators. There has never been a time during the last 50 years when the House of Lords were not compelled to adapt themselves to the will of the people less clearly expressed than has been the case in our country during the last five months.

It is always in the power of the Prime Minister, when defeated, to go before the country and the House of Lords invariably concede in their action any overwhelming defeat, while in the case of the Senate, through many long tedious weeks, they have been persistently determined that no vote should be taken.

We have always contended that the silver purchasing clause was but one of the four causes of our financial trouble. Had it been otherwise, while waiting for action of the Senate we would have seen ten failures where one has occurred. Had it been otherwise we would not have seen confidence partially restored at a time when a compromise, far worse than the original bill, was assuming vast proportions and repeal looked doubtful.

The pressing necessity for its repeal becomes more apparent each day, as the amount of gold in the United States Treasury is fast becoming depleted, and there is great anxiety and uneasiness in the minds of many, who fear that there will be delay in increasing our reserve after the silver bill has been passed by the Senate.

A strengthening of the United States Treasury by $150,000,000 to $200,000,000 in gold would leave us in a position to assure the world that we could protect our large outstanding indebtedness. Without this, should Congress adjourn, we are liable to a second panic, which, in its effects, may be greater than the first.

Cleveland.

THE W. BINGHAM COMPANY.—We are sorry to be unable to report any increase in trade since our last, but are thankful to report that it is no worse. It seems to have settled down to a hand to mouth basis that is likely to continue throughout the remainder of the year. Prices are fairly steady, but without that firmness characteristic of a rushing trade. In the cities and manufacturing towns business is rather worse than in agricultural districts. Factories still remain closed altogether or are running on short time. Retailers in this city are not busy. Buildings that have been under way are about completed, and the outlook for the winter is not encouraging. Trade in Mechanics' Tools seems to have dropped off entirely. Collections are fair.

San Francisco.

HUNTINGTON HOPKINS COMPANY.—Trade has of late been without special feature. The grain harvest is over, continuing much later this season than usual. The crops in the northern section of the State are rather light, while in the middle and southern sections they are good. The prices, however, are so very low that it is very discouraging to the farmers. As the crops are marketed money becomes more plentiful and collections have been fairly good of late. As a result of the prevailing hard times economy is the rule, and people are satisfied with the necessities of life, so that trade in some lines is very dull.

Locally the prospects of the coming Midwinter Fair have stimulated trade to a certain extent, and from this source we anticipate a lively winter.

Notes on Prices.

Wire Nails.—The past week has developed lower prices on Wire Nails and the market is now represented by $1.25 base for carload lots at mill, but orders for large lots can be placed at $1.20. The aggregate of business has been fairly large, a good many of the trade purchasing for the replenishing of their stocks and most of the mills running, though not to their full capacity. A large sale is reported in the West at a figure somewhat below $1.20, but it is understood to have been for a lot exceptionally large for these times.

Chicago, by Telegraph.—The Wire Nail manufacturers report a continued flow of orders. Inquiries are coming in from a fresh lot of buyers from time to time, showing that the belief generally prevails that this is a good time to stock up, with prices down to the lowest point on record. Quotations are based on $1.32½, Chicago, for largest lots from factory, and $1.40 to $1.45 for single carloads. Small lots from stock are quoted in a regular way at $1.50, but prices show a weakening tendency and good buyers can shade this rate.

Barb Wire.—The Barb Wire market is in an unsettled condition and prices are lower and weak. The market is perhaps fairly represented by the quotation of $2.15 for carload lots of Four-Point Galvanized at mill, but sales have been made at a lower figure. Some manufacturers are, however, holding at a somewhat higher price. The demand is light.

Chicago, by Telegraph.—The Barb Wire trade seems to be getting lighter. Manufacturers talk discouragingly about the present condition of business and prospects for the winter. The factories in operation are running only on part time and even then seem to be overstocking the market. Ordinary Galvanized Barb Wire is quoted from factory $2.40 to $2.50, while 10 cents advance is asked on less than carloads. Jobbers report their trade very quiet, but quote small lots from stock at $2.55.

Cut Nails.—The weakness developed in the Wire Nail market naturally has its effect on Cut Nails, and prices are not as high or as steady as for the past week or two. The market is represented by the quotation of 95 cents to $1 basis for carload lots at mill, but sales have been made at somewhat lower figures. The production of the mills is considerably diminished, and in the East is probably not over 60 per cent. of the capacity of the mills. The New York price for small lots from store is $1.20 to $1.25.

Chicago, by Telegraph.—The Cut Steel Nail manufacturers are doing a better trade than at any previous time this fall. Orders are coming in quite freely for carload lots and meanwhile specifications are being received in better shape from those having time contracts. Prices are unchanged at $1.20 to $1.25, while small lots from stock are still selling at $1.30.

Champion Egg Opener.—The Champion Egg Opener is put on the market by the Magic Introduction Company, 321 Broadway, New York. A description of the Opener appeared in our last issue. The device is sold to the trade at the following net prices:

	Per dozen.
Nickel plated, handsomely embossed	$2.00
Silver plated, in satin lined case	4.50

Crescent Lock Joint Stove Pipe.—This Pipe was illustrated in our last issue as put on the market by Logan, Gregg & Co., Pittsburgh, Pa., by whom it is sold to the trade at the following prices:

4-inch	$2.50	6-inch	$3.00
5-inch	2 75	7-inch	3.25

Solid Steel Putty Knife.—A description of this article appeared in *The*

Hosted by Google

Iron Age of last week. It is put on the market by Chas. J. Healy, 106 Chambers street, New York, and is sold to the trade at $1 per dozen. The Knife is nickel plated, with embossed handle.

Forg's Adjustable Door Stop and Holder.—This article is manufactured by P. Forg, Somerville, Mass., and was illustrated in our last issue. It is sold to the trade from the following list, which is subject to a discount of from 20 per cent. to 20 and 15 per cent.:

	Per dozen.
No. 155, 2½-inch, with wall bracket or holder	$6.00
No. 155, 3-inch, with wall bracket or holder	7.25
No. 156, 2½-inch, with floor bracket or holder	5.50
No. 156, 3-inch, with floor bracket or holder	6.75

Plumbers' Self Clamping Tacks.—Evory Mfg. Company, 21 and 23 Ann street, New York, are putting these goods on the market, a description of them having appeared in our last issue. The Tacks are sold to the trade from the following list, which is subject to a discount of 20 and 10 per cent. on the plain and galvanized and 20 per cent. on the nickel plated, the prices given being per 100:

Regular Pattern.

	P. I.	Galv.	N. P.
For ⅜ and ½ inch Pipe	$9.00	$10.00	$15.50
For ⅝ and ¾ inch Pipe	10.00	11.00	16.50
For 1 to 1½ inch Pipe	11.60	12.75	18.25

Single Corner Pattern.

For ⅜ and ½ inch Pipe	$9.00	$10.00	$15.50
For ⅝ and ¾ inch Pipe	10.00	11.00	16.50
For 1 to 1½ inch Pipe	11.60	12.75	18.25

Half Pattern.

For ⅜ and ½ inch Pipe	$5.00	$6.00	$9.00
For ⅝ and ¾ inch Pipe	6.00	7.00	11.00
For 1 to 1½ inch Pipe	8.00	9.00	13.00

Flush and Supply.

For ⅜ to 1½ inch Pipe	$22.50	$35.00	$50.00

Star Pattern.

For ⅜ to ½ inch Pipe	$7.00	$8.00	.....
For ⅝ to ¾ " "	8.00	9.00	.....

Glass.—In round numbers there is a capacity for the manufacture of Window Glass in this country equivalent to 1800 pots. Of these about 10 per cent., or 182 pots, are reported as now in operation. It is understood that the Workmen's Wage Committee are willing to sign an agreement for the coming fire upon the same basis as last year's scale; and are, in addition, willing to submit to a reduction equivalent to the reduction in tariff on Glass should the tariff be revised. Indiana and Pittsburgh manufacturers demand a reduction from last year's scale, and are unwilling to accede to the workmen's terms. There are no printed quotations on Glass, but a fair factory price for Window Glass in car lots is probably 85 and 5 per cent. discount for Single, and 85 and 10 per cent. discount for Double, with freight allowance. Special assortments made up by manufacturers could probably be bought for spot cash in car lots at 85 and 20 per cent. discount. Imported Window Glass is sold at from 75 and 10 and 5 to 80 and 5 per cent. discount. In Plate Glass the price depends entirely upon assortment, and prices from jobbers range from 50 and 10 and 7½ to 60 and 5 per cent. discount. Trade in all lines of Glass is quiet, with little of encouragement for the future.

ANNOUNCEMENT IS MADE by William Rothery, Wm. A. Rothery and Frederick Rothery that the recent death of John Rothery, senior member of the firm of J. & W. Rothery, Matteawan, N. Y., will in no wise change the business carried on by them for so many years. It will be continued as formerly by the surviving member of the old firm and the two sons of the deceased member under the style of Wm. Rothery & Co.

Price-Lists, Circulars, &c.

BELLEVILLE PUMP & SKEIN WORKS, Belleville, Ill.: Air Power and Hand Mining Drills, Ventilating Fans for mines and coal cars, Chilled Car Wheels, Jack Screws, Ratchet and Track Jacks, Copying Presses, &c. These goods are represented in catalogues which illustrate the various lines, with prices and descriptions. Attention is directed to their Post Hand Drill, and the Smith Double Rotary Air Drill, both of which are for use in coal mines.

THE GILBERT & BENNETT MFG. COMPANY, 44 Cliff street, New York, and 148 Lake street, Chicago: Three catalogues—Nos. 125, 126 and 127. The first is devoted to Screens for coal, sand, gravel, &c., Wire Cloth, Coal Dealers' Supplies and Wire Goods. A great variety of Screens is shown for use in handling coal, covering Car Screens, Yard Screens, Pocket or Shute Screens, House Screens, &c. Among these are some new constructions, specially designed to meet particular requirements. The Wire Goods shown in this catalogue consist of Fencing, Poultry Netting, Stove and Grate Guards, &c. The second catalogue is entitled "Fencing and Netting," and covers these subjects thoroughly, including ornamental gates and tools for erecting, fastening and stretching Wire Fencing and Netting. The third catalogue covers Wire Goods in general, such as Flower Stands, Spark Guards, Corn Poppers, Rat Traps, Wire Cloth, Window Guards, Counter and Desk Railing, Stable Fittings, &c. All are profusely illustrated.

NICOL & Co., 55 West Washington street, Chicago: High Art Hair Tools, Hardware specialties, &c. In a catalogue, No. 17, devoted to Hair Tools illustrations, descriptions and prices are given of Nicol's Curling Iron Heater, Ætna Curling Iron Heater, and of the following Curling Irons: Cute, Moustache, Columbia, Queen, French, Favorite, Silver Tipped, Grace Darling, and Cape May; also of Electric Comb Curlers, Cape May Adjustable Wave or Crimping Iron, Lillian Russell silver tipped Crimping Iron and Cape May Pinching Iron. Catalogue No. 18 is devoted to Broom Holders, Twine Boxes, Paper Bag Holders, Wagon Jacks, Bill Files, Showcard Holders, Mail Boxes, House Numbers, Lemon Squeezers, Tourist Lamp Stove, Nut Cracks, Flag Holders, &c.

BRUCE & MARKS, Gas City, Ind.: Marks' patent Grass Hooks, Weymouth patent Hay Knives, Electric and Clip per Corn Knives. An illustrated descriptive price-list shows these goods, with double backs to Corn Knives and Grass Hooks; Corn Knife with hook for picking up fallen corn; also Hay Knife.

THE YOUNGSTOWN STAMPING COMPANY, Youngstown, Ohio: Kerosene Oil Cans, sheet metal specialties, &c. A catalogue devoted to glass oil cans, galvanized iron spout Cans, Tip-top Cans, galvanized Buckets, Sap Pails and Fruit Cans, calls attention to the company's facilities for manufacturing these goods. In addition to the Friend glass Oil Cans, other grades are made including Excelsior, Favorite and Globe. Selected names for quantity orders are made a specialty. Blue brand galvanized iron spout Cans are made in 1, 2, 3 and 5 gallons. Galvanized faucet Cans, Blue brand, are made in 3 and 5 gallons. Cans to tip, Blue brand, are made in 5-gallon sizes only.

How to Keep the Store Neat and Clean.

BY WALTER EIKEL.

That depends on the store—will be an answer which naturally forces itself upon one, when he considers the diversity of store buildings. Where the store means simply a salesroom, with samples only of large goods, and small quantities of shelf goods, the matter of neatness is not nearly as difficult as it is in a store where a single room represents salesroom, office and warehouse combined.

It is absolutely impossible to even imagine a perfectly clean Hardware store. There must be a corner, or a room, and often a number of corners or rooms, where unsightly and dirty things can be stored. Dirt is simply a question of distribution.

Neatness and cleanness mean not so much the absence of dust and dirt as the distribution of these unavoidable evils. When a portion of a store building is devoted only to the display of goods it is not a very difficult matter to keep this portion of the store perfectly neat and clean. Of course, goods will be left on ledges and in improper places during a rush of custom, but a clerk or clerks with an eye for neatness will soon find an otherwise unoccupied moment in which to remedy these irregularities.

INCLINED TO SLOVENLINESS.

"To have a place for everything, and everything in its place," is the great desideratum. This will only be reached when each individual is held responsible for a certain portion of the store, and when clerks who are by nature inclined to slovenliness (and there are such) are forced to be neat in their persons as well as in their surroundings, because a person slovenly dressed, standing behind the counter, will completely counteract the beneficial influence of a neat-looking store on a customer. Of course, it goes without saying that cleanness and neatness are a great attractive feature in a store. Unhappily, many Hardware stores are so unclean and disorderly that ladies

Hosted by Google

are afraid to enter them. In such stores goods are usually covered with dust; bright goods are to a greater or less extent corroded, often through careless sprinkling, all of which detracts from the selling qualities of the goods. It is a well-known fact that whoever buys goods wants them to be new, and wants them to look new. Even such people as will leave a new Axe in the open yard during a rainy night will not be satisfied to buy an Axe with a rust spot on it.

A SPRINKLING POT.

It is necessary to have a "general cleaning up" of the store once a day. This should commence on opening the store in the morning. It should be made an inflexible rule that all goods should be in their proper places before closing in the evening. By this the accidental sprinkling of water on goods left on the floor during the day will have been avoided. Much importance attaches to the use and abuse of a sprinkling pot. It is a very easy matter to spray a few drops of water into a Nail bin now and then, or on the base of counters and the legs of Stoves; but each drop will count, and will detract from the general appearance of the store. Even in so insignificant a matter as sprinkling it is necessary to use care and judgment. Of sweeping and dusting, the same may be said. It is impossible that these daily cleanings should be anything more than superficial. To make the cleanness of the store as nearly perfect as possible, it is necessary that on each day, after the general cleaning, and during leisure moments, a small portion of the stock be cleaned thoroughly. To do this, goods must be moved from their places and replaced after thorough cleaning. It is very disgusting for a would-be purchaser to have a cloud of dust blown into his face from the top of a bird cage which is being taken from its hook, and where it had hung unmoved since its arrival in the store.

SHOW WINDOWS.

Show windows (and showcases also, to a more limited extent) should contain samples only, so that it is not ordinarily necessary to remove part of a display to supply a customer. When it is unavoidable to thus "rob" a show window, the missing article should be immediately replaced, since nothing is less attractive than a show window with empty spaces in it. Better have no show window than to have one that is not absolutely neat and clean at all times.

CUSTOMERS SEE TOO MUCH.

New goods should in all cases be unpacked and marked as far away from the interference of customers as possible, preferably in the warehouse, and should be stored as quickly as circumstances will permit. It is very undesirable to have customers see too much of the inside workings of your business. It is therefore a necessity to have a place set apart for the storage of goods pending delivery, or the arrival of invoices, for unpacking and marking. Odd goods, such as samples of articles not in stock, should not be allowed to accumulate in any one place, but should rather be distributed among other similar articles. This will greatly increase the chance of selling, and thus removing them. Never should imperfect goods be allowed to lay about, least of all such as have been returned for imperfections. Broken articles should be either repaired at once, or, when that cannot be done, they should be removed, since all imperfect goods discredit perfect ones of the same kind. Next in importance to the buying and selecting of goods is the keeping of them neat and clean.

Local Hardware Associations.

WE HAVE already referred to the association of Hardware merchants in Chattanooga, Tenn., which has been in successful operation during the present year. Information in regard to the manner in which it is constituted and its method of organization may be of interest to Hardwaremen in other cities and towns, and may suggest the lines on which similar associations may be organized. We accordingly give below a copy of the constitution and by-laws of this association:

Constitution and By-Laws of the Chattanooga Retail Hardware Association.

OFFICERS AND TERMS OF OFFICE.

The officers of the association shall be a president, vice-president, a secretary and a treasurer. The term of office shall be for one year, and the officers shall be elected on the second Monday of March of each year, and shall serve without salary unless the association should see cause to vote a special salary at any time.

DUTIES OF PRESIDENT.

The president shall preside at all meetings. He shall appoint all committees and perform all the duties incident to the office of president.

DUTIES OF VICE-PRESIDENT.

The vice-president shall preside instead of the president in his absence or inability to act.

DUTIES OF SECRETARY.

The secretary shall keep a correct record of all actions taken by the committees and when directed by the association or the committee he shall report same in writing to each member of the association. He shall keep a record of date on which information is given to members, and shall keep a copy book and copy each communication sent out, and perform any duty incumbent upon the office of secretary.

DUTIES OF TREASURER.

The treasurer shall have entire control of the finances of the association. He shall collect all dues and pay all bills and perform any duties incident to the office of treasurer.

MEETINGS.

The regular meetings of the association shall be held on every Monday night unless changed by the president, but the president may call a meeting at any time without stating purpose and action to be taken, and any action taken at such meetings shall be legal and binding.

GOVERNMENT IN MEETINGS.

Parliamentary usage as laid down in Cushing's manual shall govern this body in meetings.

REGULAR COMMITTEES.

The president may appoint a committee of three on prices. It shall be the duty of this committee to adjust all matters pertaining to prices of goods and any special matter that may be referred to them. He may also appoint a committee on railroad rates, &c. This committee shall take action on matters relating to railroads, such as overcharges, demurrage, &c., where such matters are brought before the association for action, and such other matters as may be referred to them. Also a committee of three on credits and finances. This committee shall have charge of all matters pertaining to giving and taking away credits, reporting on past due accounts unpaid, bad debts, &c., and such other matters as may be referred to them from time to time.

Also a committee of three on legislation. This committee shall keep posted on the laws directly affecting the Hardware trade and where in their judgment any good effect can be brought about in any way, the same shall be reported to the association for action.

ALL ACTION BINDING.

Every member of the association shall be bound by the action of the association and the committees on any matter referred to them.

TERMS OF STANDING COMMITTEES.

All committees shall serve for six months, but the same committees may be reappointed at the option of the president.

DUES.

The dues of each member shall be $— , payable quarterly, in advance.

ASSESSMENTS.

The association may at any time assess the members by a two-thirds vote of the entire membership.

ELIGIBILITY.

Any Hardware firm in good standing, doing business in Chattanooga, is eligible to membership, and all members of firms are entitled to attend meetings of the association; but each firm will be entitled to one vote only.

This constitution may be amended at any meeting by a two-thirds vote of the entire membership.

Trade Items.

THE CHICAGO HARDWARE SPECIALTY COMPANY, 147 and 149 Lake street, Chicago, are handling a number of novelties in the Hardware line. Among these is the Standard Stove Mat, made of asbestos, and intended for use on oil, gas or gasoline stoves, to place directly over the flame and thus keep food from burning while cooking. It is claimed that articles which usually require constant attention and stirring to keep them from burning can be cooked without stirring by the use of this Mat. They also sell the Spery combination Grater and Slicer, illustrated in these columns some time since. They further handle the Sunol Express, which is a Tricycle with a box about 28 inches square fastened in the rear to carry merchandise. The rider

Hosted by Google

sits on a Bicycle saddle on a center post and operates Bicycle pedals which propel the machine by suitable gearing connecting with the rear wheels. The machine is fitted with ball bearings and is otherwise well and durably made.

WE ARE ADVISED that the H. W. Johns Mfg. Company, who handle Peck, Stow & Wilcox Company's insulated linemen's Pliers, have received a letter to the effect that in a recent trolley accident involving a human life it was not necessary to use rubber gloves to remove the live wire, an 8-inch molded mica Plier being the only tool used. The highly charged and dangerous wire was cut quickly and easily without the least shock to the operator.

THE ELMIRA STAMPING & PAPER COMPANY, Elmira, N. Y., make a specialty of Ithaca red rosin sized Sheathing Paper, put up in rolls of 500, 809 and 1000 square feet. They emphasize the point that this Paper is especially desirable for sheathing purposes.

CHARLES N. HIGHBERGER of the Hardware firm of D. P. Highberger & Son, Wilkinsburg, Pa., died on the 10th ult., after an illness extending over two months. The deceased was in the twenty-fifth year of his age and had assisted his father in establishing the business in which they were engaged, which was started about two years ago. Previous to engaging in the Hardware business Mr. Highberger had been in the service of the Pennsylvania Railroad Company. Mr. Highberger was married in December last to Miss Grace W. Anderson, youngest daughter of William Anderson of the Pittsburgh *Commercial Gazette.* He is highly spoken of for his integrity and personal qualities.

THE SPECIAL HOLIDAY ANNOUNCEMENT of the Bissell Carpet Sweeper Company for the coming holiday season has just been issued, and comprehends a handsome line of Bissell Sweepers, in the construction of which 12 handsome woods will be used. The Sweepers will be packed, one of each wood in each dozen, and will be furnished at regular prices. In order to stimulate the sale of these goods in the hands of the dealers the Bissell Company propose to first spend several thousand dollars in advertising to consumers through the weeklies and monthlies to create a demand for the Sweepers as Christmas presents. Attached to each one of the Christmas styles of Sweepers will be a lithographed gift card by which this special Sweeper can be identified by customers with the one used in their advertisements. In connection with the cards a line of display cards for the dealers' use will also be distributed. The company state that their aim will be to so widely create a demand for the coming holiday season for their high grade goods that dealers will be warranted in stocking up without fear of carrying any over. A pamphlet is issued by the company illustrating and describing the Sweepers; also showing lithograph gift card, display cards and other advertising matter to accompany the Sweepers.

THE BARB WIRE ACT recently enacted in England is now in force. Under this act, when there is on any land adjoining a highway a fence made of Barb Wire, or on which Barb Wire has been placed, and such Barb Wire is a nuisance to such highway, the legal authorities are authorized to have it removed. It is expected that little time will be lost in abolishing the use of Barb Wire along the highways, and the authorities are referred to by our English contemporaries as beginning to enforce the provisions of the act. The suggestion is made to ironmongers that they should give attention as to how they may best avail themselves of the opportunities thus presented for supplying and fixing up other sorts of fencing to replace the Barb Wire which is removed. They also suggest that the action of the authorities might advantageously be anticipated, and that business might in this way be secured by the trade.

E. J. HUSSEY & Co., 80 John street, New York, have been appointed sole agents for the Falls Heater in the State of New York, and are also prepared to handle export trade. The Heater consists of a metal drum, with short pipes extending out from its sides. The drum is hung upon a projective from a standard, directly over the chimney of a lamp, for heating small rooms, offices, &c. The Heater can be adjusted in hight to suit the lamp over which it is used.

SAMUEL M. NICHOLSON, who for several years has held the positions of vice-president and secretary of the Nicholson File Company, Providence, R. I., was on October 21 elected president to succeed his father, the late William T. Nicholson.

Horseshoe Rack.

WE ARE INDEBTED to Murphy, Maclay & Co., Great Falls, Mon., for a description of the Horseshoe rack shown in the accompanying illustrations, Figs. 798 and 799. The rack consists, it will be observed, of an arrangement of boxes, 12 x 12, 18 inches deep, which are suspended in a frame, as shown in Fig. 798. The construction of the boxes and dimensions are shown in Fig. 799. The boxes have on the sides a ¾-inch hole bored a little above their center, with wrought washers screwed against the sides to serve as bearings. A corresponding hole is bored in the uprights and a machine bolt used as an axle. Each box will hold about 125 pounds of Shoes. By tilting the boxes it is easy to get at Shoes for customers and also to replenish the boxes from stock. A sample of the Shoes kept in each box is fastened to the outside, with a printed designation of the kind and size of Shoe. The extreme hight of the frame is 4 feet 2 inches, and the frame is made of sufficient length to accommodate the required number of boxes. Murphy, Maclay & Co. use 32 boxes, which accommodate the three kinds of Shoes they carry. These boxes are divided among four frames, two of which have eight boxes each, one ten boxes, and one six boxes. They are located in the warehouse adjoining the store.

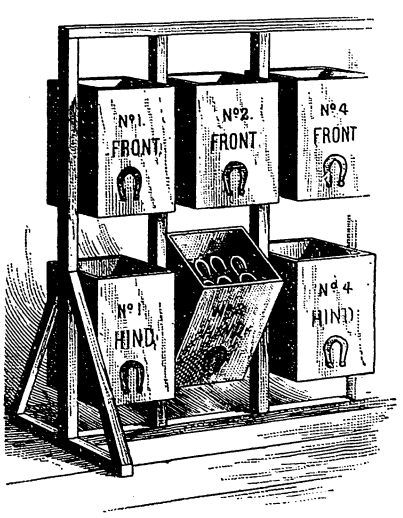

Fig. 798.—Horseshoe Rack.

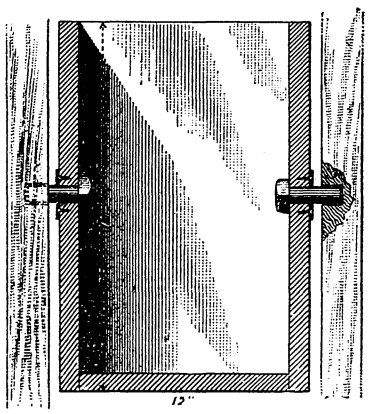

Fig. 799.—Size and Construction of Boxes.

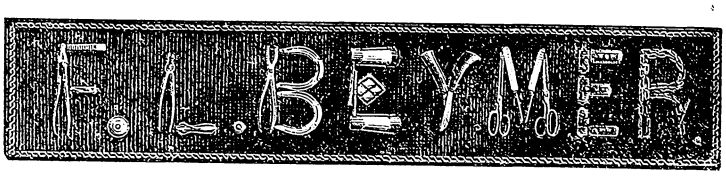
Selling At a Loss.

WE HAVE RECEIVED the following interesting communication from an esteemed Western correspondent:

"I sold two carloads out of store Saturday, but did not make a cent—there was no profit in it." The speaker was a young salesmen representing one of the largest houses in the iron trade in the West. And why "no profit in it?" Was it because the young man lacked capacity to transact business profitably, or are his employers brainless? If no profit, then a loss. There is no other ending, except the final one of bankruptcy. And bankruptcy brought about by a policy so deliberately suicidal is positive dishonesty. All merchandise ought to be sold at a profit to the merchant. Not a profit that will enable him to just live and finally die poor, but a profit that pays his reasonable expenses of doing business and leaving him a comfortable income for old age and his family. But the policy of "there was no profit in it" induces the merchant to contend fiercely for still lower prices when buying goods, thereby forcing values downward. No sooner has he obtained a slight concession than he wires his traveling salesman "take the order at any price." And the man who has just bought at "any price" at once proceeds to "knock out" his hated rival in business by taking the contract or order when there is "no money in it." And so he swings surely toward the point where he "cannot pay," and the one who sold him "two carloads of goods with no profit in it" is struck with possibly $15,000 worth of hopeless debt, and then proceeds to tell everybody that these are terrible times. A house strongly intrenched in capital may stand up for many years under such a policy, but the weaker ones die young.

In my experience I recall no instance of a business governed by a sound policy being forced to the wall and com-



Hosted by Google

pelled to accept defeat. I recall a marked example of selling goods with no profit. A buyer for a large house, in my presence, made a strong attempt to secure a concession on a bill of goods, claiming that they were resold at cost. The house is noted for selling goods at low prices, and while they have secured trade in several of the Oriental countries, I have known profitable business almost at their own doors to be neglected. Why send goods to Japan while home trade goes uncared for? Why sell a carload of goods with a value of, say, from $1000 to $1500 for less profit than could be realized on one-tenth of the sum named? When we engage in business we hope to succeed; but we can only have success by getting back our dollar with interest and a profit added. Any other policy than this leads to dishonest bankruptcy.

It is time the press called attention to this subject. It ought to be placed before the eyes of every man in business, and in such a way that when he goes home he will carry the matter in his mind. Thinking about a thing at home generally results in something good.

Closely related to this matter of selling goods at no profit is this: Every traveling man ought to be instructed never to make a price on his goods unless there is a reasonable ground for securing an order. It is not good policy to walk into a wholesale Hardware house in St. Paul and, knowing that the house is already heavily stocked with nails and does not wish to buy, offer 30,000 kegs at 10 cents less than market rates. This is bound to "come back" at the traveling man's house sooner or later with bad results.

Business men, you do not like a loss in dollars and cents, but you do like to see good round profits. Some of you are not on the right track to secure the latter. Think of this matter with care and you may adopt a policy that will secure you a good return on your money invested and at a reduced risk. Better sell less and make more profit than make little profit and sell more.

A Hardware Sign.

A Hardware Sign.

THERE is much ingenuity shown by Hardware merchants in the arrangement of their names in articles of Hardware, for window or store display, or for use in connection with exhibits at fairs, &c. The arrangement illustrated in the accompanying cut was used by F. L. Beymer of Indianola, Iowa, and was placed in connection with a wall exhibit at a fair. The sign was made on a board 7 feet long and 1 foot wide, surrounded by molding and covered with red plush, a bright chain surrounding the whole as a border. The letters were 8 inches in hight and composed of Tools, as shown. The F was formed of Pliers, Rivet Set and Pocket Level; the L of Hog Ringers and Recapper; the B of Spring Punch and two Horseshoes; the E of two Rattle Boxes, two Nutmeg Graters and a fancy Cake Cutter: the Y of two Farrier Knives; the M of two pairs of Scissors and two Table Knives; the E of Cupboard Catches and the R of Halter Chain. Washers, Octagon Machine Nut and Picture Nail were used for periods. The sign attracted the attention of old and young and was a pronounced success. Above it was an exhibit of Tools and Tinware tastefully arranged on a black background, and beneath it on the floor stood cook and heating Stoves, Coal Vases, &c. In front of the Stoves on the floor was a piece of black cloth 2 x 5 feet in size, upon which was written with small brass Safety Chain, in one piece. "Beymer is on south side of square." The i's were dotted with three links of the Chain, and a small steel Square placed after "of" represented the word square. This was read by nearly every one who passed the exhibit, and was especially attractive receiving many commendations.

The Atha Tool Company's Catalogue.

THE illustrated catalogue and price-list of the Atha Tool Company, Newark, N. J., just issued, is a handsomely printed book of 158 pages, bound in stiff cloth covers. The manufacturers state that tools stamped Atha Tool Company are made from best cast steel and are fully warranted, while tools stamped J. Rose, and Standard are made from cast steel, but are not warranted. The line of goods shown includes Nail, Carpet, Farriers' and Riveting Hammers; Prospecting Picks; Prospecting, Carriage Ironers', Machinists', Engineers', Blacksmiths', Plow, Coopers', Clipping, Tinners', Farriers' Turning, Pavers', Upholsterers', Saddlers' and File Cutters' Hammers; Coopers' Drivers, Hoop Sets, Splitting Chisels; Stone Axes, Stone Hammers, Stone and Quarry Picks, Masons' Hammers, Stone Sledges, Drilling Hammers, Blacksmiths' Sledges, Wood Choppers' Mauls, Wedges, Mill Picks, Railroad Track Wedges, Crowbars, Swages, Hardies, Tongs, Cold Chisels, &c. The completeness of the lines of Hammers, Sledges and blacksmiths' tools is referred to; also to the fact that the book has been arranged with the idea of making it one which buyers in the jobbing trade will find complete in these goods, and at the same time easy of reference. It is remarked that a new extra quality of adze eye Nail Hammers and Machinists' Hammers has been recently added to their line, and that both styles of this grade of Hammers are nickel plated, and that the quality of material and workmanship are the best. Several styles of Hammers are shown which, it is stated, have become popular, and which are manufactured exclusively by this company. Among these, particular attention is called to the patented Nail Holding Hammer and to the adze eye Machinists' Hammer, both ball pein and straight pein.

It Is Reported—

That O. R. Cross & Co. are successors to H. Moffett & Co., Hardware merchants, Visalia, Cal.

That Beenvenne & Boulanger are a new firm at Suncook, N. H. They will deal in Stoves and Tinware.

That Stephen Squier has entered the Hardware and Stove business at Buffalo, N. Y. He will also conduct a plumbing department.

That Gimmell & Irvine, dealers in Stoves, &c., Parkersburg, Pa., have been succeeded by Irvine & Galbraith.

That the Hardware firm of Lane & Ellis, Corning, N. Y., have dissolved partnership, I. C. Lane purchasing his partner's interest.

That C. F. Linthurst has disposed of his Hardware business at Exeter, Neb., to Chain & Williams of Utica, who have taken possession. Mr. Linthurst will return to Iowa after he has closed up his business affairs at Exeter.

That A. O. Nelson, manager of the Stillwater Hardware Company, Stillwater, Minn., has been succeeded by George L. Bancroft, who comes from Chicago, where he was for a number of years connected with Kelly, Maus & Co.

That Manfred Sears has purchased the interest of Mr. Hester in the Hardware firm of Plummer & Hester, Dallas, Ore.

That S. M. Beattie of Quitman, Mo., has sold his Hardware stock and residence in that place to R. A. Wyatt.

That John W. Lincoln, Plattsburg, Mo., has sold his stock of Hardware to Logan Trimble and Thomas Messick.

That J. W. Lattin, Wahoo, Neb., has purchased the John Schram & Co. Hardware stock and engaged in business. F. M. Adell will be Mr. Lattin's assistant in conducting the store.

That E. A. and N. M. Worden have bought the Hardware store of Taylor, Stebbins & Co., Hinsdale, N. H. The business will be hereafter carried on under the style of the Worden Company. The Worden brothers were part owners of the store for five and a half years under the firm name of Worden, Jones & Co., having bought out L. A. Lamson. They sold out three years ago to the late E. S. Taylor and W. O. Stebbins.

That the Hardware firm of Osborn & Alexander, San Francisco, Cal., has been dissolved. George W. Alexander will continue the business.

That Grimmer & Dick are a new Hardware house at Calais, Maine.

That W. G. Stanton, Hardware merchant, Oneonta, N. Y., has sold out his stock to Lewis & Wilson.

That Thomas Pearce, Hardware merchant, Little Falls, Minn., has removed to Staples, Minn.

That on the night of the 21st ult. the Hardware store of G. G. Gaston, Steubenville, Ohio, was robbed of a large amount of Cutlery and Firearms.

Hosted by Google

To cover up their tracks the thieves kindled a fire in the rear of the store, but the fire was discovered by passers by and extinguished.

That Bakko & Breidal have succeeded M. O. Bakko & Co. in the Hardware business at Kenyon, Minn.

That Byron D. Wilson has purchased the Hardware store of W. Phillips at Excelsior, Minn.

That McKay & Seymour have succeeded B. F. Fowler, Hardware merchant, at Dickinson, N. D.

That O'Connor & Grandy, Hardware merchants, St. Thomas, N. D., have been succeeded by Joseph O'Connor.

That Coulson & Brundage's Hardware store at La Harpe, Ill., was damaged by fire on the 15th ult. Loss, $1000; fully insured.

That Laughlin & Brown, McComb, Ohio, have purchased from the receivers the Hardware stock of Orwig & Starr, and will continue the business at the former stand.

That Simpson Bros. & Co., Duncombe, Iowa, have purchased the Hard ware stock of Creed & Bailey, and moved it into their new brick building.

That W. G. Oliver, Waupun, Wis., has sold his Hardware business to Lovell & Co. of Hustisford, Wis. Mr. Oliver has been in the Hardware business in Waupun for 41 years and thinks he has earned a rest. He will, however, continue the manufacture of the Oliver Street Lamp.

That John Harphol's Hardware store at Clinton, Ky., was destroyed by fire September 22.

That Fred. Bilsborrow has sold his Hardware business at Paw Paw, Mich., to J. Holmes and E. Bilsborrow, who will conduct it under the firm style of Holmes & Bilsborrow.

That burglars broke into the Hardware store of Everson & Hawkins, Oshawa, Ont., on the 25th ult., and stole some 40 Jackknives.

That the Hardware store of O. A. La Budde, Elkhart, Wis., was robbed on the 21st ult. of $100 worth of Guns, Razors and Pocket Knives.

That the Hardware firm of Stilwell & Allen, who have been in business at Glens Falls, N. Y., for 16 years, have been dissolved. C. R. Whipple has purchased the interest of J. M. Allen, and the new firm will be Stilwell & Whipple.

That in a large fire at King City, Mo., on the 15th ult., the Hardware store of T. J. Hasty & Son was entirely destroyed.

That Cobban Brothers' Hardware store, at Groveland, Mass., was burglarized on the 19th ult. The safe was blown open and a small sum of money and some watches taken. The explosion smashed a large stock of Glass and Crockery Ware.

That E. A. Allen, dealer in Hardware, Huntington, Mass., is contemplating selling out his stock of Hardware, Stoves and Tin.

That Fred. Kuhn of the Simmons Hardware Company, St. Louis, will shortly be married to Miss Ottilie Villinger of Mascoutah, Ill.

That the store of C. H. Mason, Hardware merchant, Salamanca, N. Y., was destroyed by fire on the 13th ult. Loss, $4500; insurance, $3000.

That Mr. Burtress of the Hardware firm of Burtress & Evanson, Ulen, Minn., has disposed of his interest in the business to Herman Dahl.

That the firm of J. H. Burbanks & Co., Hardware dealers, Cohoes, N. Y., was dissolved on the 12th ult. The firm will hereafter be known as Burbanks & Co., the partners being Clara E. Burbanks and Adolphus G. Burbanks. The business will be continued at the old stand.

That the safe in the Hardware store of R. W. Wetherbee, Lincoln, Maine, was blown open on the 15th ult., but the burglars were frightened away.

That Kundert & Fitzgerald's Hardware store, at Madison, S. D. was set on fire on the afternoon of the 11th ult., from a kettle of boiling tar on a gasoline stove in the work room in the rear of the store. The energetic work of the firemen, however, saved the building, although the loss by water and smoke is estimated at $3000.

Paints and Colors.

It should be understood that the prices quoted in this column are strictly those current in the wholesale market, and that higher prices are paid for retail lots. The quality of goods frequently necessitates a considerable range of prices.

Between slowness of trade in most lines of goods and rather sharp competition in some, the general market presents an unsettled appearance. Thus the "outside" manufacturers of White Lead are aggressive enough to cause some uneasiness among the combined corroders; the "outsiders" interested in Quicksilver Vermilion manufacture have forced a reduction in association prices, and outside of these lines is a sort of helter skelter competition that gives matters anything but a pleasing appearance. It is remarkable in this connection that lower prices have failed to stimulate business in the slightest degree. Spot purchases have been of very commonplace type, at all events, and orders for future deliveries lose something by comparison with the general run at this season of the year. Just now the prospects do not appear brilliant for radical improvement in any line.

White Lead.—Between private offering of "outside" brands at low prices and the aggressiveness of some manufacturers of "quick process" Lead in both private and Government contracts, the market is at least superficially disturbed. Some jobbers go so far as to intimate that the combined corroders have made special prices in a broader area of territory than is generally understood, and that the official list and terms are more "nominal" than otherwise. That jobbers still sell at prices under the "list" is beyond all question of doubt, and there are some signs that the general market, under weight of various adverse influences, is really a weak one.

Red Lead.—Purchases of foreign stock in bulk have been on a moderate scale, and the demand is rather slow at present. German is offered in round lots, to arrive, at 6⅝¢, and might be secured at a shade less for December or later shipment. The naval contract for domestic was taken at a shade under 5¼¢ by an outside manufacturer and knowledge of the fact has a momentarily unfavorable influence upon the general market, as far as large buyers are concerned.

Litharge.—The demand has fallen off to very moderate proportions and business is at present on a rather small scale. There is no positive change in prices, but the market seems to be a shade easier, particularly for the low grades.

Orange Mineral.—Quite good sales have been made of French and German brands for near future delivery, but the movement has not sufficed to affect prices materially. Domestic is quiet and without change.

Zincs.—Raw material has advanced somewhat in price, and that fact, along with steady deliveries of Oxide on former orders, imparts better tone to the market for the latter. New business, however, is still on a moderate scale. Foreign brands sell slowly and at somewhat irregular prices.

Colors, &c.—In American Quicksilver Vermilion prices a reduction to the basis of 53¢ for bulk and 54¢ for bags has been made by the association. Outside manufacturers are meeting the reduction and the market at present is unsettled. In other lines of Colors no positive changes have been announced, but the general market looks rather soft and is unmistakably slow.

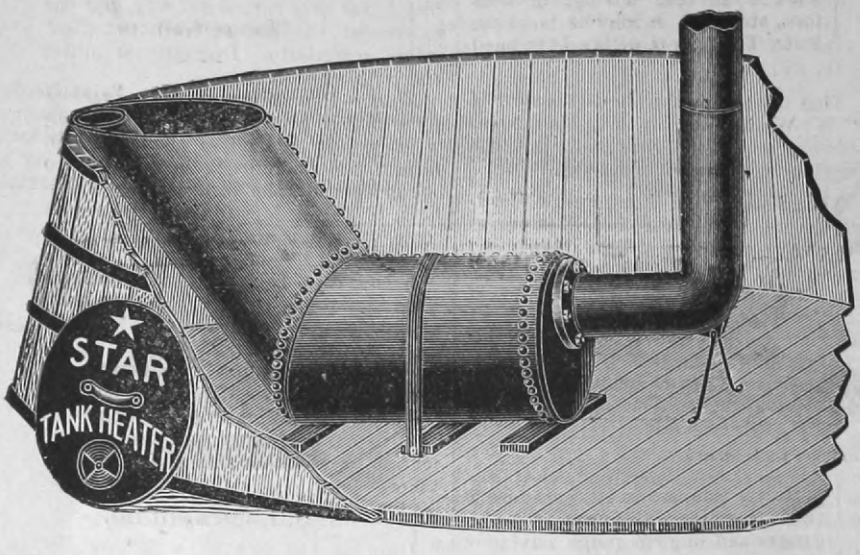
Oils and Turpentine.

Drawing the line at a further advance in pressers' prices for Lard Oil for prompt delivery, there has been no change to speak of in the market for Animal and Vegetable Oils. Speculation has remained dormant and export interest continues very tame in all departments. Home trade buying, except of Cotton Seed product by a few large Western consumers, has been of strictly conservative type. As a whole, the situation remains very much the same as it was a week ago, with little sign of immediate radical movement in values.

Linseed Oil.—City pressers keep their price at 40¢ for Raw Oil, and outside brands are offered at 38¢. There has been no pressure to sell from either source, and the market has gained in tone to that extent. The periodical rumor of an agreement between the conflicting interests has circulation, but it does not appear that buyers have been influenced thereby to the slightest extent. In any event most reports were to the effect that business is merely fair for the season.

Cotton Seed Oils.—Fairly good sales have been made of both crude and refined product. It was an uneven, fitful business, but ultimately operated to stiffen prices, and at the close the market showed quite steady tone. Prime crude brought 36¢ @ 36½¢, prime Summer Yellow 40¢ @ 41¢, and other grades corresponding prices.

Lard Oil.—City pressers have advanced their price for prime Oil to 80¢ upward. Receivers of Western brands are asking quite as much, and the general report is that available supplies are moderate. Sales have been small at the advance, and the demand just now is very sluggish.



Miscellaneous.—There has been no change in the market for any variety of Fish Oils and former prices prevail throughout. Olive Oil has met with somewhat freer sale at last week's prices. Cocoanut Oil is unchanged and has met with slow sale.

Spirits Turpentine.—Under the influence of quite lively demand prices advanced to 31¢ @ 31½¢, as to style of package. Since then there has been a slight reaction, but the market shows very good tone in the absence of any considerable addition to the supply here.

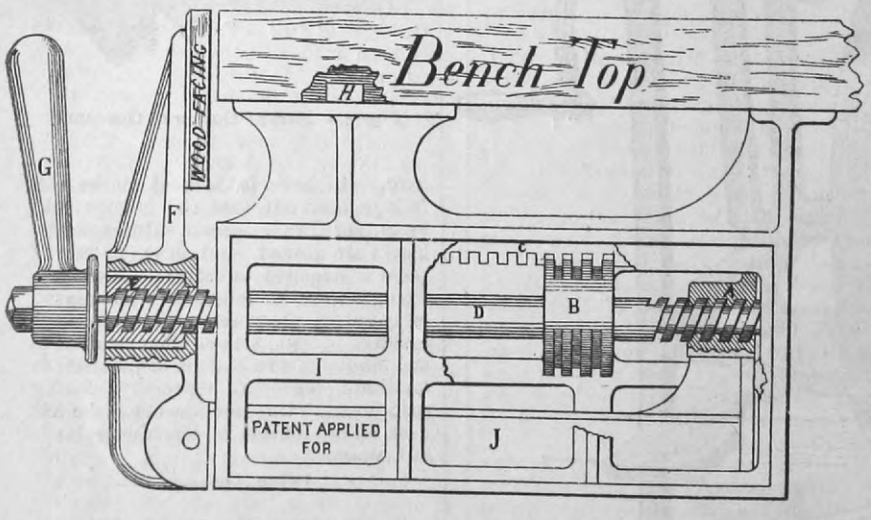
The Star Steel Tank Heater.

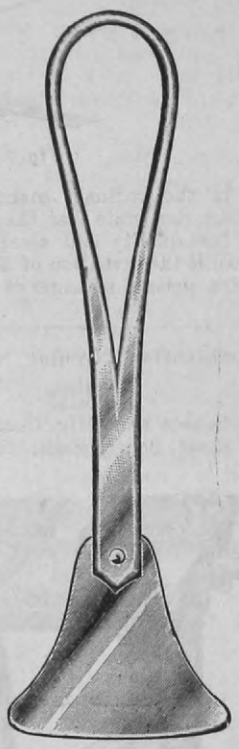


An illustration is presented herewith of a tank heater which has been brought out by Hunt, Helm & Ferris of Harvard, Ill. As will be seen from the cut, it is a stove made of heavy boiler steel which is intended to be placed in the tank to be heated and is almost entirely under the water. It is intended to burn any kind of fuel—hard or soft coal, wood, chips or cobs—can be set in any tank without cutting the tank and the ashes can be taken up at any time without disturbing the fire. Being made of wrought metal exclusively, it is not liable to be broken in shipping, nor to crack or break when in use.

The Star Steel Tank Heater.

The Lightning Quick Acting Bench Vise.

George A. Gumphert & Co., 146 Bread street, Philadelphia, are putting on the market a quick acting bench vise, as illustrated herewith. The device consists of a cast iron casing I having the rack C in its top. The shaft D is made from cold rolled shafting, held in place by the phosphor bronze wheel B. The shaft is connected with the slide J by means of the nut A, and by turning the handle G the slide is made to move backward. The toggle nut E has a thread of coarser pitch than the thread in the nut A, thus the same operation of the handle causes the jaw F to move toward the material held in the vise at a slightly faster pace than the slide J, the object of this being to prevent the springing of the jaw from the top edge of the material. When the handle G is in a vertical position a blank part in the wheel B, from which the thread is cut away, allows the wheel B to run clear of the rack C when the front is pulled out or pushed in. In operation material is held against the edge of the bench, the vise front pushed forward as far as it will go, and the handle turned until the material is held tightly. It is claimed that this is a quick acting vise, combining the screw principle with rapidity of action, in such a way as to secure a tight grip; that it can be attached to a bench in a few moments; that it will take work from zero to 9 inches in thickness, and that it is always ready for instant operation.



The Lightning Quick Acting Bench Vise.

THE AMERICAN AXE & TOOL COMPANY'S plant, at East Douglas, Mass., was visited by fire on the 21st ult., the reports in regard to which in the daily newspapers have greatly exaggerated the facts. The building destroyed was 200 x 65 feet in dimensions, and the loss, we are advised, is inside of $65,000, which is fairly, if not fully, covered by insurance. Adjusters are now working on the claim. The shop destroyed never employed more than 60 men. The company's stock of Axes at that point, having been stored elsewhere, was not injured, so that by utilizing other factories the company do not expect to be embarrassed in executing orders.

Streeter's Pot Scraper.

The cut herewith shown represents a pot scraper put on the market by N. R. Streeter & Co., Groton, N. Y. It consists of a nickel plated steel blade with a sharpened rounded edge, the blade being attached to a nickel plated metal handle. A combined pot chain and scraper also is made by the same company, in which a pot chain is hung to the blade of a scraper, similar in shape to the one shown in the cut. In operation the scraper blade is put on the pot chain for scouring, or the scraper may be used by itself. This arrangement obviates the necessity of the hand coming in contact with the pot chain when cleaning pots, kettles, &c.

Streeter's Pot Scraper.

McGuire's Edging Shears.

Dille & McGuire Mfg. Company, Richmond, Ind., for whom S. A. Haines is manager of the sales department, are putting on the market edging shears with detachable handles, as herewith shown, a patent on which has been applied for. In Fig. 1 the shears are shown, while their use is illustrated in Fig. 2. They are designed for borders and edges where the ordinary mower cannot be operated. They are also used

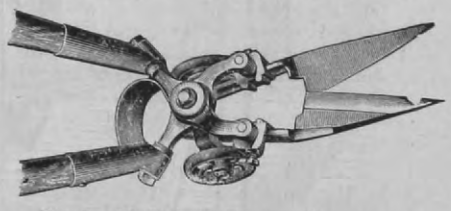


Fig. 1.—McGuire's Edging Shears.

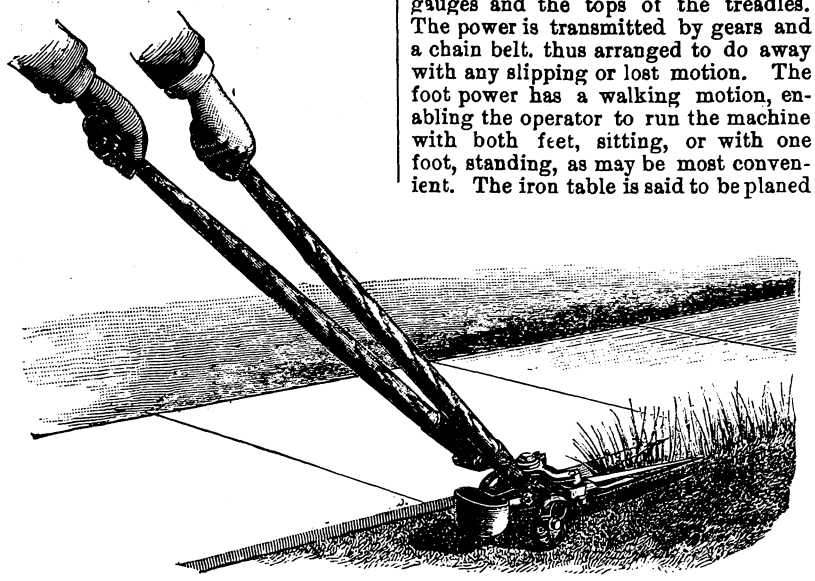
Hosted by Google

for trimming shrubbery, both high and low. If desirable the handles may be readily detached and the shears used by hand in the ordinary manner. The manufacturers state that the shears are of the best quality and nicely finished. The tool is the invention of Elwood W. McGuire, general manager of the company.



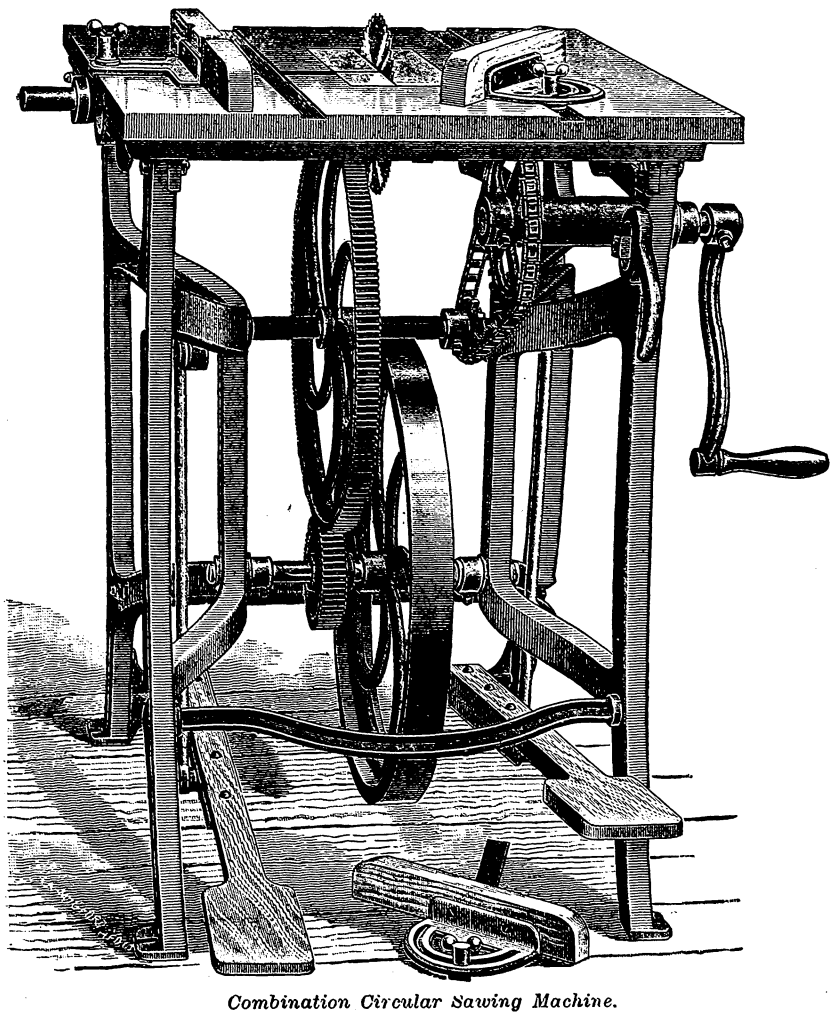


Fig. 2.—Edging Shears in Operation.

Combination Circular Sawing Machine.

The Seneca Falls Mfg. Company, 209 Water street, Seneca Falls, N. Y., are putting on the market the combination circular sawing machine herewith shown. The machine is made of iron and steel, with the exception of the hardwood strips in the center of the table, as well as on the face of the gauges and the tops of the treadles. The power is transmitted by gears and a chain belt. thus arranged to do away with any slipping or lost motion. The foot power has a walking motion, enabling the operator to run the machine with both feet, sitting, or with one foot, standing, as may be most convenient. The iron table is said to be planed perfectly true and in its center are fitted two adjustable sliding cut off or miter gauges and one rip gauge having steel slides fitting the grooves in the table, thus securing, it is claimed, accuracy in their adjustments. The table is hinged at the back and can be adjusted up or down by the hand screw in front for grooving, rabbeting, &c. The machine has been especially designed for the use of carpenters, cabinet, pattern, picture frame and box makers, as well as wood workers generally, and is known as a No. 2 Union combination saw. The manufacturers refer to the machine as being strong, substantial and thoroughly well built, suitable for various kinds of work in light ripping, cutting off, mitering, grooving, gaining, edging up, boring, jointing stuff, &c. Ready for use the machine weighs 305 pounds and when boxed for shipment 410 pounds.

Combination Circular Sawing Machine.

Change Gatherer.

E. Chouanard, 3 Rue Saint-Denis, Paris, France, is offering the change gatherer as herewith shown. It consists of a metallic tray mounted on a base, the tray being held in a horizontal position when not in use, as shown in Fig. 1. Change in coins is placed on the tray by the salesman and slides into the hand of the customer when he tips the tray, by pressing downward with the back of the hand upon the projecting lever at either end. Thus the gatherer may be operated by either hand, whichever is the most convenient. It is pointed out that the change may be gathered in a second, although the hands are gloved, and even if one of them is engaged in carrying packages. The gatherer is designed to be placed on counters, showcases and in front of cashiers' desks, ticket office windows, and similar places and is calculated to facilitate business, especially during rush hours. One of these machines has been on exhibition in Machinery Hall, at Chicago.

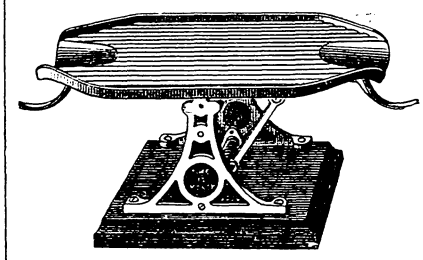

Fig. 1.—Change Gatherer.

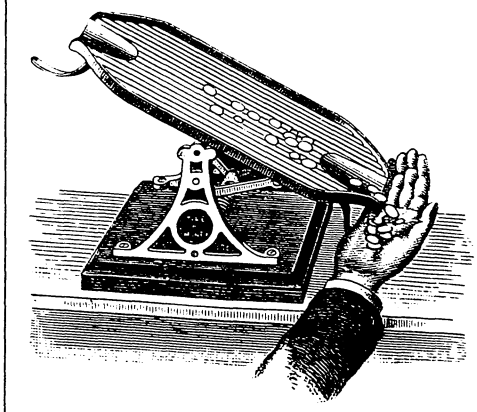

Fig. 2.—Change Gatherer Operated.

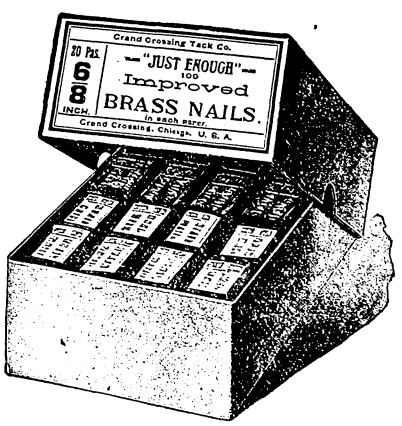

E. Benedict died at his home in Wellington, Ohio, of heart failure on October 25, in the sixty-seventh year of his age. The deceased was born in Sharon, Conn., April 7, 1826, was a miller by trade, but came to Wellington in 1854 and there engaged in the Hardware business, which he carried on to the time of his death. Mr. Benedict is referred to as an exemplary

Hosted by Google

citizen, whose loss will be felt by a wide circle of business associates and friends.

"Just Enough" Improved Brass Nails.

Grand Crossing Tack Company, Chicago, Ill., are putting up ⅝ brass nails, as shown in the accompanying cut. The nails are for tapping shoes, and for this purpose each paper contains 100 nails, just enough, it is stated, to tap any pair of boots or shoes. The nails retail at 5 cents a paper, and are packed 20 papers in a carton, 50 cartons in a

"Just Enough" Improved Brass Nails.

case. Swedes iron nails are put up by this company in the same form, but in "double enough" packages, each paper containing 200 nails, or enough nails to tap two pairs of boots or shoes.

CHANCES OF SUCCESS. Episodes and Observations in the Life of a Busy Man. By Erastus Wiman.

Erastus Wiman has been a conspicuous figure in business circles in this country and Canada for a number of years, and has been at different times an eager, if not a very judicious champion of causes coming up. His anxiety to bring together his native and his adopted country has led to scenes bordering on the humorous. He has attempted again and again to drag the Canadians and Americans into one another's arms without conspicuous success thus far. Mr. Wiman has met the majority of the leading men who are making history in this country, and has an exceedingly entertaining and clever way of narrating his experiences. This and a light method of dealing with a serious subject will make his work very attractive to a good many readers.

It is unpardonable, however, when dealing with economic subjects that Mr. Wiman does not better inform himself. In a chapter entitled "Has the National Debt Ever Been Paid?" he takes up the steel rail trade and figures out that since 1865, $17.60, the duty on steel rails, has been paid on the steel put down on 130,000 miles. Figuring at the rate of $1800 a mile Mr. Wiman reaches the brilliant conclusion that there has been expended upon the railroads of the country for duty or royalty to a class a sum of about $235,000,000. Mr. Wiman doubts whether the Government got one-tenth of this sum. It appears that the manufacturers "very kindly and generously distributed to the laboring classes and spent for raw material half the amount realized, but the other half, the royalty of $17.60 per ton, went into the pockets of the patriotic manufacturers." In other words, the steel rail manufacturers have, since 1865, pocketed a little more than $100,000,000. Why did they stop in their extortions at the tonnage required for new roads? An enormous tonnage has been put down for renewals. Did they not exact their $17.60 per ton on that too? Considering the fact that a number of them failed during this process of assimilation of $100,000,000, the remaining few must have absorbed the greater part of this sum. In spite of this, one of the oldest and largest concerns went into the hands of receivers this year. Where did their share of the untold millions go to?

Seriously, it is difficult to conceive how an intelligent business man can do such criminal blundering. There has been no time during the last 20 years when the difference between the price of American rails and of foreign rails was equal to the duty; or in other words, American rail manufacturers have never had a chance, even had they desired it, to make the selling price of their rails as high as the sum of the foreign price and the duty. In the same chapter Mr. Wiman makes the statement that steel rails to-day can be had in England for about $14 per ton. As a matter of fact, the lowest price of which we have heard is £3 10/, equivalent to $17.

It is quite evident that Mr. Wiman depends for his facts upon the reports occasionally printed in the daily press. Thus, in a chapter entitled "Combination Upon Combination," he swallows whole the story that the principal men in the Standard Oil Company have consolidated the iron ore interests of Lake Superior, "a consolidation involving $100,000.000 in value." We need hardly recall to our readers the fact that this much talked of consolidation takes care of only a number of properties in the Mesaba range, while the famous older ranges, the Marquette, Menominee and Gogebic, are still controlled by the same interests which have been the producers for years. We hold that Mr. Wiman has no right to give whatever weight his statements may possess to the perpetration of falsehoods like those referred to. He may be pardoned when he alludes to Andrew Carnegie as "the genial Scot who is playing such a successful 'star engagement' before the American people," because that is a matter between himself and another individual, but he has no right to prejudice great interests by unpardonable slovenliness in the examination of facts.

The Board of Railroad Commissioners of the State of Missouri in their eighth annual report state that they do not think any material increase in the railroad mileage of that State can be reasonably looked for the coming few years. It is true there are large areas in the State totally unprovided with railroad facilities, but these sections are generally but sparsely settled and present physical difficulties in the way of railroad construction which will be hard to overcome within a reasonable limit of cost. The day of speculative railroad construction seems to have passed, and where it cannot clearly be demonstrated that a projected line will be fairly remunerative the capital necessary for its construction cannot be had. It is not probable that railroads in the future will be built in Missouri in advance of actual requirements. There are a few lines in the State for which extensions seem to be necessities, and these extensions may be built, but the commissioners do not think the construction of independent new lines can be expected to any great extent.

Current Hardware Prices.

NOVEMBER 1, 1893.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

The character @ is used to indicate a range of price; thus discount 50&10@50&10&5 % signifies that the goods in question are sold at prices ranging from discount 50 and 10 % to discount 50 and 10 and 5 %.

THE IRON AGE

THURSDAY, NOVEMBER 9, 1893.

The Jeffrey Portable Elevator, Screen and Conveyor.

The engraving here presented shows a machine designed by the Jeffrey Mfg. Company of Columbus, Ohio, which is designed for handling sand and gravel. It is arranged to dig the sand and gravel from the bank and then separate it and deposit it in separate cars. The capacity of this machine is about 40 cars per day of 10 hours, making it possible to load 30 cars of sand to 10 cars of gravel, this depending largely upon the per cent. of sand in the bank.

The lower timber work is mounted on truck wheels to suit standard railroad gauge. On this track is placed a circular gear rack engaging with the gear pinion, which is fastened to an upright shaft on the upper frame work. Caster wheels and center plates are placed between the upper and lower frame work for the purpose of revolving the entire upper part of the machine on the lower frame work in a complete circular movement, thus enabling the operator to reach the bank from either side of track.

THE JEFFREY PORTABLE ELEVATOR, SCREEN AND CONVEYOR.

The elevator is provided with the Jeffrey double strand steel chain, to which suitable buckets are attached. The buckets are made of heavy sheet steel, banded on the top edge with teeth riveted to the front lip for the purpose

Hosted by Google

of digging the material from the bank. This elevator is mounted on a wrought iron angle ladder frame, which is allowed to swing from the upper or delivery end of the elevator by means of two wire cables fastened to the lower end of the ladder and passing over the sheave wheels at the end of the jib timbers and down on to two spools on the frame work.

By means of crank and gearing the elevator is raised up to the bank, and then is allowed to work its way down to a line even with the track.

The sand and gravel are elevated and discharged on a shaking screen, the mesh of which can be made to suit the grade of sand desired, the gravel passing off over the screen to a rubber belt conveyor into the car, the sand passing through the screen to a chute below and into the car.

If it is desired at any time to work the elevator at an angle with the track the shaking screen, chute and conveyor are arranged to swing at an angle in order to keep them about square with the car.

Chicago's Iron and Steel Interests.

While the census figures for 1890 are for a period so long past that they have no practical business value, they possess historical interest. For this reason alone a statement concerning Chicago recently obtained from the Hon. Carroll D. Wright, now in charge of the Census Office, is worthy of attention. The statistics given cover the iron and steel industries of the city of Chicago, and do not include important establishments usually classed with Chicago but located outside of the city limits. The table is as follows:

Iron and Steel Industries for the City of Chicago, Illinois.

	No. of establishments.	Capital (*b*).	Average No. of employees (*c*).	Total wages paid.	Cost of materials used.	Value of products.
Iron and steel (*a*)	14	$22,803,264	4,326	$3,081,598	$11,217,414	$24,317,831
Minor iron and steel industries:						
Foundry and machine shop products.....	213	22,410,275	13,130	7,797,613	13,874,810	30,227,816
Hardware.	27	2,183,595	1,704	946,958	1,649,904	2,724,968
Iron and steel forgings.	6	688,000	259	194,712	364,523	687,400
Iron and steel nails and spikes, cut and wrought, including wire nails.....	4	723,104	376	193,008	289,830	635,084
Iron work, architectural and ornamental..	90	3,252,798	2,427	1,643,507	2,345,209	5,018,159
Springs, steel car and carriage..... .	5	501,876	240	165,680	213,265	565,000
Steam fittings and heating apparatus.....	16	2,626,623	2,224	1,269,260	1,552,224	3,921,738
Wire work, including wire rope and cable .	24	431,980	366	217,511	377,241	893,299
Total.....	399	$55,621,715	25,052	$15,509,877	$39,284,420	$68,991,295

(*a*) The weight of the products of these 14 establishments is 1,147,744 tons of pig iron and finished iron and steel.
(*b*) Does not include the value of hired property.
(*c*) Is a general average for all classes of wage earners, including officers and firm members engaged in the business or in supervision, also clerks.

It will be seen from this table that the foundries and machine shops of Chicago constitute the most important part of the city's iron and steel interests. The establishments engaged in architectural and ornamental iron work really belong to the same class. The aggregate thus formed comprised over 300 establishments, with a capital of over $25,600,000, employing 15,500 hands. These foundries and shops are engaged in turning out practically the whole range of products covered by such works anywhere. They have advanced from the mere jobbing establishments which spring up in growing towns, or the more pretentious works of the same class based on railroad patronage, until in creative and constructive capabilities they are found in line with the establishments in older sections whose fame rests on a reputation earned in past generations. While the production of the cruder forms of iron and steel is a very important part of Chicago's industrial prominence, yet it is in foundry and machine work that specially rapid progress seems destined to be made. Instead of becoming another Pittsburgh, in which manufacturing steel and iron for the country at large takes preponderance, Chicago seems destined to be a Manchester or a Philadelphia, manufacturing crude iron and steel into highly finished forms, and thus building up a congeries of the minor industries. This view is borne out by the rapidity with which such establishments have sprung into existence within the past two or three years, or else have removed to the vicinity of Chicago from other localities, both East and West. If a census could now be taken, it would undoubtedly disclose very great growth as compared with the figures given in the above statement.

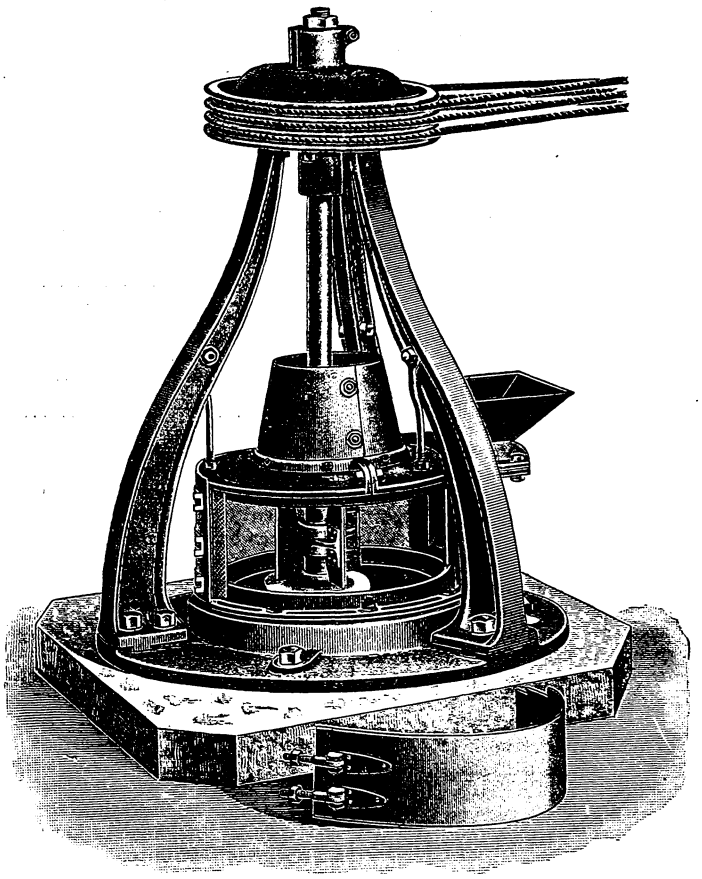
In this connection it would be an unpardonable oversight not to refer to agricultural implement factories and car works. Such establishments were not included in the statistics above given, probably for the reason that they turn out a composite product. They consume large quantities of iron and steel, however, and their foundries, machine shops and forges employ thousands of skilled workmen. Perhaps in no other line has there been greater growth in Chicago in the past three years, either in the extension of the facilities of old works or the erection of new ones in manufacturing agricultural implements. In 1890 they employed an aggregate of 3945 hands, while last year one establishment alone employed as many, if not more.

The minutes of the British Admiralty in the "Victoria"-"Camperdown" court martial, which have just been promulgated, confirm the findings of the court. The report closes thus: "The 'Victoria' capsized owing to her water tight doors not being closed. Otherwise she would have remained afloat and reached port under her own steam. The general structure did not by any fault of principle contribute to her loss. Regulations will be issued to the fleet which, while maintaining the responsibility and discretionary powers of the commanders, will insure under certain circumstances, and especially when a collision is possible, that the water tight doors and hatches shall be closed as far as possible and that men shall be stationed at those necessarily kept open." The minutes express regret that Captain Johnstone of the "Camperdown" failed at once to order extreme helm and full speed astern.

The Columbia Iron & Steel Company.

Before the Circuit Court of Appeals at Pittsburgh last week an argument was made on the motion for the appointment of a receiver for the Columbia Iron & Steel Company of Pittsburgh, whose works are located at Uniontown, Pa. The attorneys who argued against the appointment of a receiver stated that the petitioning creditors are second mortgage bondholders and that the real estate is intact, and nothing has occurred to interfere with the securities. Any transactions complained of affect only the personal property and there is no need of a receiver as yet. The court has not rendered a decision. F. A. Yeager, formerly secretary of the Columbia Iron & Steel Company, has furnished the following statement regarding the troubles of the concern:

When in March, 1891, the company went into the hands of a receiver the Uniontown people and papers said the sole cause of the failure was mismanagement. Now they say hard times caused the second failure. At the first failure E. M. Butz started to work to have the receiver discharged, and got a lot of Uniontown men to advance money in return for enough stock to control the board. The stock was in trust and was to be returned when Mr. Butz got the company in a solvent condition. Mr. Butz got a five years' extension from the creditors and later got them to accept second mortgage bonds.



With the plant practically free from debt the Uniontown people took charge of it. Strikes closed Carnegie's beam mills and business boomed for the Columbia Company. The Uniontown people thought they had struck a gold mine. They elected Robert Hogsett as president. He had no experience in running a steel mill. The mill manager was forced to resign, and then Mr. Butz, vice-president, general manager and only practical man about the mill, was voted out. The president was voted a salary of $10,000 per year and the secretary $3600, where before the president got nothing and the secretary $1500.

The company entered into a unique deal. The Reading Rolling Mill Company were furnished with steel beam blanks on credit, which they manufactured into finished material, and then outsold the Columbia Company in the Eastern and Western markets. The Reading Company failed to meet their paper, and the Columbia directors got frightened and closed their works and began selling off the stock on hand. They then confessed judgment to themselves.

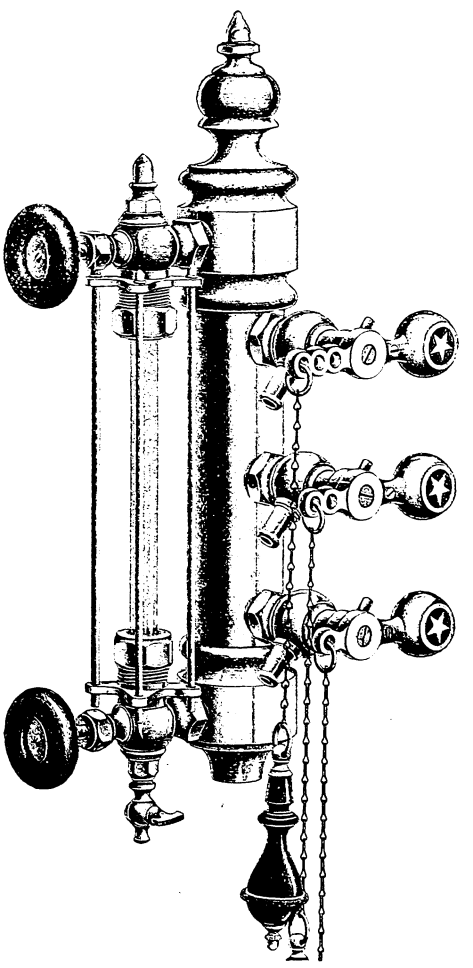
The Griffin Mill Arranged for Rope Drive.

The Griffin mill, for the reduction of rock and ores of all kinds to a fine powder, employs in its construction the principle of a rigid roll on a suspended shaft running against a ring or die. The roll on the revolving shaft is free to swing outward against the die by the use of a universal joint, the centrifugal force holding the roll in contact with the ring or die against which it runs. The shaft is suspended from a pulley above by means of a universal joint rotating with the pulley. The roll is revolved within the die in the same direction that the shaft is driven, but when coming in contact with the die it travels around the die in the opposite direction from that in which the roll is revolving with the shaft, thus giving the mill two direct actions on the material being ground.

THE GRIFFIN MILL ARRANGED FOR ROPE DRIVE.

The material to be ground is put into the automatic feeder, which delivers it into the pulverizing chamber, where the rapidly revolving roll with plows attached to the under side keeps the material in constant motion between the roll and die, and, as the whole mass of material is being stirred, the fine portion rises to the top and passes out through the screens.



On the shaft above the roll are fans, which draw in air through the conical housing and assist in forcing out the finished product. By this method no dust can escape except through the screens. After going through the screens the pulverized material passes through an opening into the receptacle underneath, from whence it can be conveyed wherever desired.

The mills will work either wet or dry. The engraving represents a Griffin mill of small size, arranged for rope drive. This mill is intended for the same work as the larger ones, but is of less capacity. It will grind 12 to 15 tons of ore per day, with 10 to 12 horse-power. These mills are made by the Bradley Fertilizer Company of 92 State street, Boston.

After 18 years of active business at 85 to 91 Elm street, New York, the well-known firm of Ogden & Wallace, iron and steel merchants, are preparing to remove their business to more commodious quarters and a location more advantageously situated as regards transportation facilities and accessibilty to tidewater. The firm are now having built for them a warehouse at the corner of Greenwich and Houston streets, the structure being after their own designs and being arranged with a view to the easy and expeditious handling of stock. The warehouse will be 100 x 100 feet in size, having doors on Houston and on Greenwich streets, with a driveway extending through from street to street. It will be one story in hight, and the offices will be located in a structure built above, thus consolidating the entire business practically under one roof and providing for greater efficiency in carrying on the business. It is hardly necessary to state that the warehouse, as well as the office annex, will be equipped with modern conveniences for the economical and speedy conduct of business and delivery of stock. The original firm was established early in the nineteenth century by George W. Shields at the corner of Broad and Beaver streets. The business is therefore one of the oldest in the iron and steel trades. Afterward the firm of Geo. W. Shields & Co. was established, the Co. being Messrs. Smith and Hegeman, who afterward succeeded Mr. Shields. About 1868 the firm moved to the corner of Pearl and Dover streets, where the Brooklyn Bridge anchorage now is. Mr. Hegeman died soon after this, and the firm of Smith, Sturges & Co. was then formed, Messrs. Ogden and Wallace, who constitute the present firm, being the unnamed partners. In 1874 G. G. Smith retired, when the present partners succeeded to the business. A year later the warehouse and office of the firm were removed to the present location in Elm street, where, with greater facilities, the business has largely increased. It is expected with the larger and more modern warehouse now building and more advantageous location, that it will be still further increased.

The Star Gauge Cock.

The Star Brass Mfg. Company of 33 Lancaster street, Boston, Mass., are introducing an improved gauge cock especially adapted for high pressure boilers. It is provided with Jenkins' adjustable vulcanized packing, which is so arranged that by removing the adjustable screw it can easily be taken out and another substituted. The arrangement of the cock is clearly brought out in the engraving. These cocks are made with length of bodies from center of water gauge connections of 12, 15 and 18 inches.

The Star Gauge Cock.

One day last week New Orleans broke the cotton record with the largest receipts of the staple ever known at that or any other port, namely 54,433 bales.

Sheet Mill Progress.—I.

BY A. BEARD, CAMBRIDGE, OHIO.

Unlike other branches of the iron and steel industry, there has been no record of radical or noticeable changes in the method of rolling iron and steel sheets until recent years. In the manufacture of bars, structural shapes, plates, &c., the three high, universal or Belgian and reversible mills have almost entirely taken the place of old style two high rolls, but no one has to this date been intrepid enough to spend any very large amount of time or money in an attempt to revolutionize the old established process of making light sheets. Many improvements have been made in the manner of producing a high finish, and in a marked degree the quantity produced has been materially increased in mills devoted to the manufacture of sheets of ordinary finish, but so far as the initial process is concerned the sheet rolling industry occupies nearly the same position which it did 50 years ago. The inventions of Bessemer, Siemens and others have assisted progress in sheet mill practice and have provided means in the shape of steel billets and sheet bars for the production of sheets of first-class quality at about the same cost for which common sheets were formerly produced. Sheet mill managers have, however, combined their ideas with those of machinists and foundrymen, and as a result remarkable changes have been made in the construction of machinery.

English Practice.

Before referring to these changes in detail it is necessary to review briefly the causes leading to them. For this purpose a drawing is presented herewith to illustrate the method so long employed in English sheet mills. In English mills, Fig. 1, a stand of bar rolls is attached to each sheet mill on the outer end, and all pile rolling is done on these rolls. Muck bar piles, made sufficiently heavy to make two sheet bars of the required weight to produce sheets of a specified thickness, are charged into the pile furnace, averaging 15 to the heat. They are then passed through the bar rolls, and when drawn to the proper length are cut into two pieces at bar shears, which are operated by means of a small pair of pinions attached to the wabblers on outer end of bar rolls. On the lower pinion a lug is cast, upon which the long arm of the shear works. When cut to length, with the usual allowance for trimming after the sheets are finished, these bars are given two passes through the sand rolls, after which they are taken to the chilled rolls and are reduced to about No. 18. To accomplish this two sheets are rolled together. This completes the first part of the process, all being done without reheating. At this stage sheets are termed "singles." To still further reduce the thickness three sheets are placed together, and, after being reheated, are passed through the chilled rolls for the second time. This product is called "doubles." When sheets No. 26 to 30 gauge are required, the pack of three sheets is opened, the sides meeting each other are reversed and doubled, afterward placed in the reheating furnace for the third time, and again passed through the chilled rolls. When this work is completed sheets of No. 26 or 27 gauge are called "lattens," and lighter than this "extra lattens." Prices paid for labor are regulated on this basis. After the rolling is finished the packs are taken to jaw shears and the edges trimmed. When sheets are made of iron there is a cut of 1 inch or more taken from the edges, as the sides of the pack crack when rolled; but steel sheets preserve a more even edge, and the amount required for trimming does not exceed ½ to ⅝ inch on each side of the pack. When the trimming is completed the sheets are annealed in the reheating furnace, and when cold are ready for shipment. Box annealing, or "close annealing," as the process is termed in England, is not a common practice. Fully three fourths of the sheets produced are annealed in an open furnace where the flame is allowed to come into direct contact with the surface of the sheets, the result being scale raising, red edges, burnt corners and a generally uneven appearance.*

American Practice.

In American practice all light sheets are box annealed, being placed on cast iron carriers upon which the sheets are piled, then covered with a cast or wrought iron lid, made air tight by piling sand around the bottom. This carrier and box are then drawn into the annealing furnace and heat applied. By using this method scale is not raised on the sheets—they are smooth, flat and of even color. It appears strange, from an American point of view, that the young English ironmasters do not avail themselves of this method, as it gives so much superior appearance to the sheets, but they are content to do as their predecessors did before them, a commendable trait except when competition is brisk and modern advantages necessary to success. In the matter of utilization of waste heat and the employment of power the English are very careful. Fuel is expensive It will be noticed that a vertical boiler is attached to the sheet mill, Fig. 1. This boiler has one large central flue and two cross flues near the top. It is auxiliary to the steam plant of the establishment. The power of the engine is always used to its greatest capacity. To illustrate this, note that the jaw shear is operated by a long connecting rod attached to an eccentric on the main shaft.

It is a noteworthy fact that while importations of English sheets of iron and steel have decreased with the erection of American mills, English manufacturers make frequent purchases of American highly finished sheets for use as locomotive jackets, for lagging purposes, gas stoves and other uses where a fine appearance is required.

Labor in English and American Mills.

Comparisons of wages earned by English and American workmen have been made so often and prostituted to such base political purposes that the writer has not the assurance to present figures on this matter, but this article would not be complete without a comparison of the amount of labor performed in English and American sheet mills respectively. In English mills the crews work 12 hours each and do all the work they can in that time, taking only short intervals for meals. They commence with muck bar piles and do their own annealing. During 24 hours about 16,000 pounds of finished sheets are produced by two crews consisting of the following men:

Rollers	2
Roughers	2
Catchers	2
Furnacemen	2
Helpers	2
Prilers	2
Shearmen (using jaw shears)	2
Markers	2
Scrap Boys	2
Total	18

Compared with this, American crews only work eight hours. They commence with sheet bars already prepared for them on an independent bar mill and have no annealing to do. There are three shifts during 24 hours, which produce about 19,000 pounds of finished sheets sheared ready for the annealer. To accomplish this work the following men are employed:

Rollers	3
Roughers	3
Catchers	3
Heaters	3
Pair heaters	3
Matchers	3
Doublers	3
Shearman (using squaring shears)	1
Hold up	1
Opener	1
Scrap boy	1
Total	25

The shearman and his helpers are allowed to shear for three shifts. They work about eight hours. From this statement it will be seen that the Englishmen have much the hardest time of it for about two-thirds as much money for their work. An English mill only turns out 16,000 pounds of product to 19,000 pounds in an American mill, but it takes seven more men to do the work in America. Having discussed the method of making sheets and the result obtained in England, it is in order to notice the means used for the purpose and compare with those now employed to produce the increased product and at the same time reduce the risk of breakage and consequent stoppage to a minimum. English and American sheet mills were similar 20 years ago excepting that Americans never aspired to the luxury of a stand of bar rolls for each mill. This being the case the old "housing," "housen" or holster as it is variously called in different localities will serve to illustrate old time machinery of both countries.

The piece of machinery represented in Fig. 2 is not as antiquated as a sheet mill man might imagine upon just looking at it. It is only 20 years old, being designed in 1873 for a sheet mill now in operation. It was reinforced at its weak points in 1885 and since that time has been reordered no less than seven times to replace broken ones. All orders being from the same mill. This housing weighs about 11,000 pounds. It is what is commonly known as flat-footed. In the evolution of sheet-mill machinery this old style housing and its dovetailed bed plate are dying hard. It is not until the executor or sheriff offers this kind of machinery for sale that the massive modern housing with its V-shaped bed plate and solid masonry takes its place. The pattern of the old style housing is still in possession of a prominent firm of iron founders at Pittsburgh. It was used as late as last year and is almost a counterpart of a piece of machinery manufactured by a well-known Staffordshire, England, concern for 50 years past. The rolls used in housings of this design are 20 inches in diameter, necks 15 inches in diameter and the wabbler 11¾ inches at

* Box annealing is a common method in English and Welsh tin mills. This article refers only to mills making light sheets for galvanizing, roofing and general manufacturing purposes.

Hosted by Google

its largest part. To illustrate the difference in the strength of these rolls a sketch showing the relative sizes of the wabblers on the old style rolls and the modern 24-inch rolls is shown in Figs. 3*a* and 3*b*.

Chilled rolls, 20 inches diameter, for light sheet mills have long been considered all that was required in the way of strength in English mills, and some manufacturers in this country use rolls of that size to this day, but it is probably because they have their old housings and want to make the last penny out of the old machinery and not because they do not acknowledge the benefits derived from using heavier machinery.

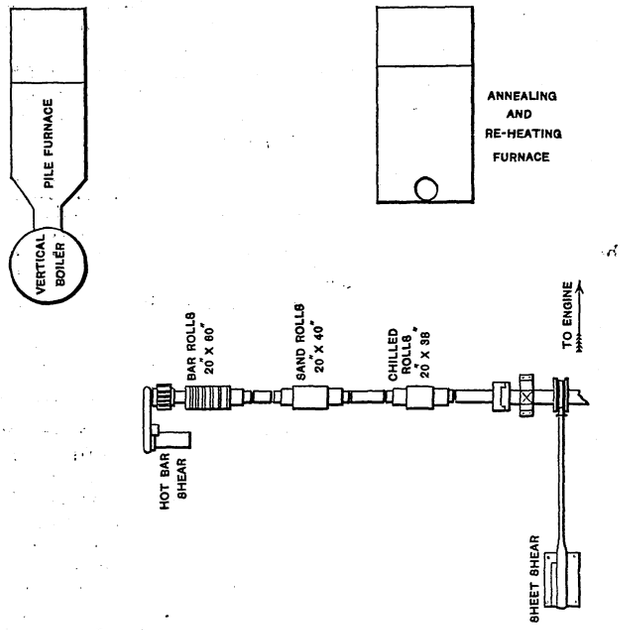

Fig. 1.—Plan of English Sheet Mill, 20-Inch Rolls. —Weight of Housings, 11,000 Pounds.

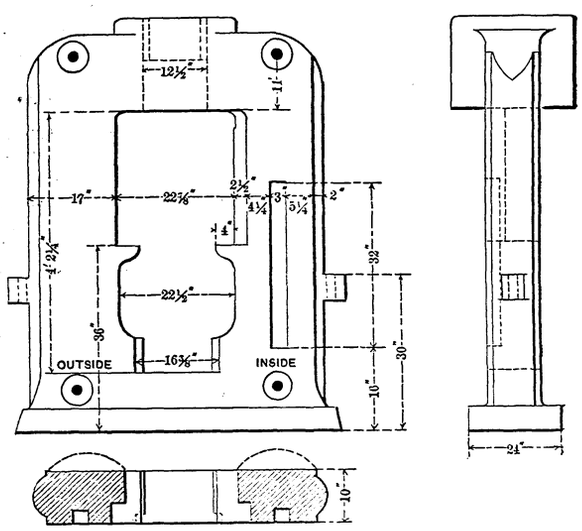

Fig. 2.—Old Style Housings, Designed 1873.—Weight, 11,000 Pounds.

SHEET MILL PROGRESS.

Heavier Machinery.

The main object of American sheet-mill men appears to have been to produce the largest quantity possible and so construct the machinery that breakages become exceptions instead of a rule. A great deal has been accomplished in this direction and the means employed are worthy of notice. The illustration, Fig. 4, of an American sheet mill plant shows many points of economy. Furnaces are all set near to the railroad coal track, so that coal is unloaded directly to the bins at the sides of the furnaces. Under the coal bin shutes a narrow gauge track is laid, to convey sheet bars from the bar shears to the pair furnaces. The large and small engines are placed near together, so that only one man is needed to attend them. The small engine operates two pairs of shears, runs the machinery to raise annealing boxes and also runs the roll lathe. The annealing furnaces are near to the shears, and no material has to be handled twice. The process is progressive, from the billet furnace to the warehouse. All that has to be brought back is scrap from the sheet shears to the scrap furnace. A plant of this description would turn out 35 to 40 tons per day of sheets, from No. 18 to 30 gauge, various widths, from 20 to 36 inches.

When the agreement made between rolling mill proprietors and the Amalgamated Association of Iron and Steel Workers, increasing 8 hours' work from 105 to 135 pairs of double sheet, came into force many mill managers found that their machinery would not stand the strain. Rollers "rushed their mills," breakages came fast, and managers grew furious. As a result the output was in many instances limited to the old standard, but in many mills the diameter of sheet rolls was changed from 22 to 24 inches and the mills were then equal to the work. As a result of increased output all rolling mill builders had to make patterns for heavier machinery. The housings have been increased in size, also the rolls. A mill recently built in the Mahoning Valley was constructed in such a heavy manner that the roll trains weighed fully one half more than a roll train constructed for a similar purpose 20 years ago—viz.: rolling light sheets from No. 18 to No. 30. The housings in this mill, illustrated herewith, Fig. 5, weighed 23,000 pounds and the bed plate 1000 pounds to the foot of roll train. The mill is running successfully and if a breakage occurs it will be a matter of much surprise. Of course, chilled rolls will break as they always have done, for no one has yet found a preventive. There is fame and fortune for the man who fathoms this unexplained mystery and devises means to keep chilled sheet rolls from breaking at an unexpected moment.

If translated reports are correct, Bohemia is ahead of the United States in the uses to which steel rolls are put. In American practice cast steel rolls have long been used in bar mills, and for rolling rails, channels, I-beams and other structural shapes, but the Bohemians are credited with having used steel rolls successfully in the manufacture of sheets. An order was placed with a Chicago concern some time ago for a pair of sheet rolls to be made of steel, but for some reason or other it was never filled. Can it be that herein lies a substitute for cast iron chilled rolls of every day use, that treacherous piece of machinery, the constant and unexplained breakage of which is the bane of sheet mill managers' lives? Is there no way of hardening the surface of a steel roll so as to make it impervious to scale marks, so that it will retain a smooth surface when in use, equal, if not superior to the surface of a chilled iron roll? It has been stated that steel rolls become pitted when used, that scale adheres to them, and that they are not suitable for obtaining a fine finish on a large area. If this purpose can be accomplished, and the

Hosted by Google

common theory regarding steel rolls be proved incorrect, then chilled roll makers will lose a profitable business which only years of successful practice makes profitable, and the steel sheet roll will furnish managers with a serviceable and unbreakable piece of rolling mill machinery, and it is quite probable that one-third of the sheet rolls now made will supply the demand. Strange things have happened in the mechanical world. Why not this?

The Breaking of Rolls.

To explain more fully the trouble which sheet manufacturers who use the hot finish process have to contend with, and the exigencies which have to be allowed for in their cost accounts, a drawing is presented herewith to illustrate the degree of expansion and contraction to which sheet rolls are subjected during ordinary treatment.

The dark lines in the drawing show the shape of the rolls when heated, and dotted lines indicate the shape of rolls after they are dressed in a roll lathe ready for work, and while the roll is cold before work is commenced. The concave in these two rolls amounts to about $\frac{1}{64}$ and $\frac{1}{128}$ inch = 0.0234375. It varies according to the class of work to be performed. If wide sheets are to be rolled—*i. e.*, nearly the width of the body of the roll—the concave is made in a lesser degree than if sheets of narrow widths are to be rolled, as narrow widths will "puff up" or expand the rolls near their center quicker than wide sheets, which distribute the heat more generally throughout the body of the rolls. In the manner of turning or dressing sheet rolls custom varies; some roll turners turn one roll straight and put all the concave in the other, while others divide it between the two rolls. This seems to be a matter of opinion the correct view of which has never, if properly demonstrated, been made public.

In ordinary sheet mill practice the rolls expand after the third or fourth heat until they are nearly straight. Good rollers exercise the utmost care in starting up their mills, and endeavor to avoid breakage through warming up too rapidly, particularly in cold or frosty weather, and they will continue at all times during their work to exercise care, avoiding extremes in the rise and fall of the temperature of their rolls and giving the screw pressure in accordance with conditions, but in spite of all this care the best of rollers meet with mishaps, a report like that of a carbine is heard, the pack buckles in the rolls and the roller realizes that he has "cracked one," to use a rolling mill expression.

Probably there is not a sheet roller living to-day who has ever told how he broke a roll, and if there is common cause for it the secret is well kept. Theory has, however, provided many causes, and reasons are given which

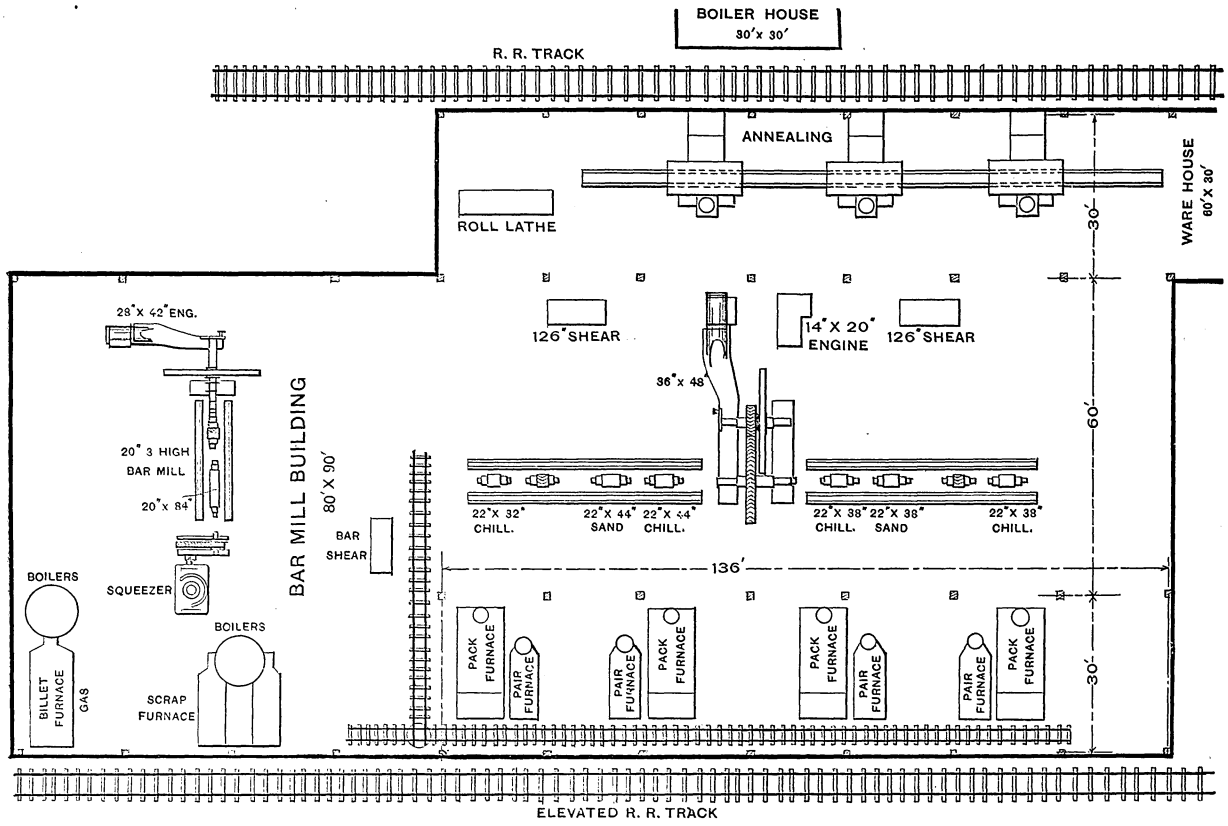

Fig. 4.—Plan of Modern American Sheet Mill.—Beard Design.—Capacity, 35 to 40 Tons per Day, No. 18 to 30 Gauge, 20 Inches to 36 Inches Width.

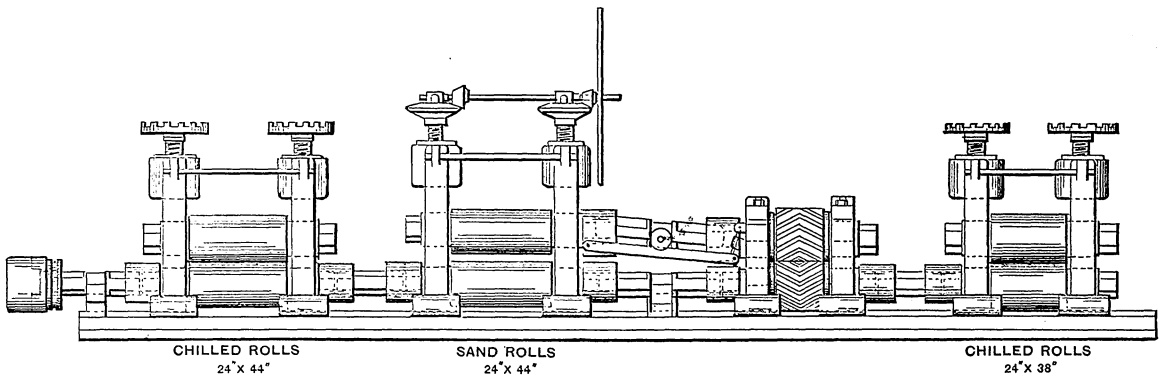

Fig. 4a.—Elevation of Modern American Light Sheet Mill, 24-Inch Rolls.—Weight of Housings, 23,000 Pounds.—Booth Design.

SHEET MILL PROGRESS.

Hosted by Google

are worth consideration. Rapid expansion and excessive screw pressure are undoubtedly the two principal causes of sheet roll breaking. Upon those two causes all others rest except those attributable to machinery which is out of line, or culpable negligence, such as rolling bars not properly heated, &c. A modern sheet roll 24 inches diameter, of solid cast iron, is a massive looking affair to an outsider, and it seems incredible that they will break through their center without a moment's warning, nevertheless it is a fact. It is a trouble with which sheet mills the world over have to contend, and the proprietors are looking for a man who can find a remedy or a substitute. A cooling tube through the center has been tried without effect, and brasses having a current of water running through them were supposed to be a step toward greater safety, but rolls

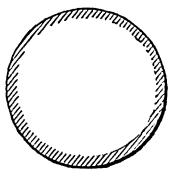

Fig. 5b.—Center of Roll, Open Grain.—Lines Show Chill, Varying from 5/8 Inch to 3/4 Inch.

SHEET MILL PROGRESS.

keep on breaking, and managers seem to have become somewhat reconciled to the no-cure theory and they devote their energy to preventing such misfortunes by training their men to exercise great care, keeping the rolls free from cold drafts of air, keeping the roll train in line, and such precautions. If a substitute is to be found it looks as though some outsider must furnish it. Can steel foundrymen do it? The writer does not say they cannot; the question is asked, not for curiosity, but for information.

The natural life of a sheet roll under ordinary wear and tear, average depth of chill, is about eight months. It is liable to be broken at any time during that period. A guaranteed life of that length would be well worth the price at which chilled rolls are now sold and a big premium attached.

By the recently issued report of the Minister of Mines of Tasmania, for 1892-93, it is shown that the quantities of the various minerals produced in that colony during the year were: Gold, 37,303 ounces; silver, 10,339 tons ore, and 23 tons bullion; tin, 5009 tons; and coal, 39,000 tons. The total value of the island's mineral output was $3,257,385, exceeding that of the previous year by $200,000.

WORLD'S FAIR NOTES.

The Standard Oil Exhibit.

Dr. David T. Day, in charge of the Standard Oil Company's great technical exhibit in the north gallery of the Mines Building, announced last week that the entire exhibit had been given to the Chicago University, to be held in trust for the Columbian Museum. The exhibit cost $50,000 in collection and installation. It is the most complete and best arranged illustration of petroleum deposits, working and distribution ever made. All details are covered in this exhibit, and there is scarcely a question to be asked with regard to petroleum that has not been anticipated and a graphic illustration made to answer it. It is given to the Chicago University in trust so it may be held intact until the university trustees are satisfied that the museum is on a sound basis of organization and is prepared to install the display in accordance with the wishes of the donors.

The Columbian Museum.

The Columbian Museum, to which a slight allusion has been made above, is a contemplated outgrowth of the fair. Its projectors have secured a charter of incorporation and hope to retain the Fine Arts Building in Jackson Park as the home of the museum and a memorial of the great exposition. This building is strictly fire proof, being constructed of brick and steel, the only perishable feature being an outer coating of staff, which can be renewed from time to time as it needs repairs or else can be replaced by something more durable. Valuable collections of a greatly varied kind have already been secured for it. Many of the exhibits are of such a character that their owners would prefer to give them away, although costing large sums of money, if they knew that they would be cared for or would serve a useful purpose. For some time there was doubt about the project succeeding, as it was seen that it would be expensive, and the city authorities had no power to assume such a burden. But last week Marshall Field, the merchant prince, whose fame has grown with Chicago's growth, made a gift of $1,000,000, on condition that the incorporators raise $500,000 more in cash and secure the donation of $2,000,000 in exposition stock. This stock has a prospective value now of 15 to 20 cents on the $1, owing to the very favorable turn in the affairs of the Exposition within the last two months. So many holders of stock have already given it to the museum, and so many citizens of Chicago have subscribed cash in addition, that Mr. Field's contribution is almost as good as clinched. Now that the museum project is in such excellent working order, the work of soliciting gifts for collections of various kinds by technical schools and other institutions have been in great measure abandoned, on the ground that it is better for the general good to have one great collection in such a museum than a number of fragmentary ones.

Other Collections.

Some institutions are and have been hard at work securing exhibits which they have paid for handsomely. The technical schools are prominent among these. Here again is the lavish generosity of a Chicagoan made conspicuous. Philip D. Armour, the packer, some time since gave his personal check for $50,000 to the Armour Institute, to be expended among the fair exhibitors for scientific and technical or educational apparatus. The agents of the Institute have consequently been active in inspecting exhibits and taking what they considered desirable. They are said to have secured the best of the instruments of precision and other scientific apparatus in the Electricity Building, while in the Mines Building very fine mineral collections have been obtained which would otherwise have been brought together slowly and at very much greater cost. This has been a grand opportunity for the Armour Institute, which has been appreciated at its full value. But other technical schools have not been idle. Their agents have also been at work. Their alumni have further been keen to see something that would be appreciated by the *alma mater* and have given much assistance in securing apparatus of great value or specimens of exceeding interest.

A Woman's Memorial Building.

So much was accomplished by women in showing the special aptitude of the sex in connection with World's Fair matters that efforts are being made to continue the work thus begun. Potter Palmer of Chicago, whose wife was the brilliant president of the Board of Lady Managers, has donated $200,000 toward the erection of a building in some suitable location in that city. This is another of the many permanent influences growing out of the great forces exerted in the building up of the fair, and is made possible through the munificent endowment of one of Chicago's public spirited citizens.

The Passing of the Fair.

Those who counted on being able to supplement in November the partial sight-seeing previously done have been grievously disappointed. Exhibitors are too eager to get away, and, of course, exposition officials are anxious to accommodate them. Tracks now disfigure the grounds, while the interior of the buildings has been a scene of confusion since November 1, which has only been intensified every succeeding day. Some buildings are already half deserted, the work of removal being more quickly accomplished than had been deemed possible. Very shortly the deserted buildings will be all that is left of the glories of the fair and then the work of destruction will begin on them.

Summing Up the Attendance.

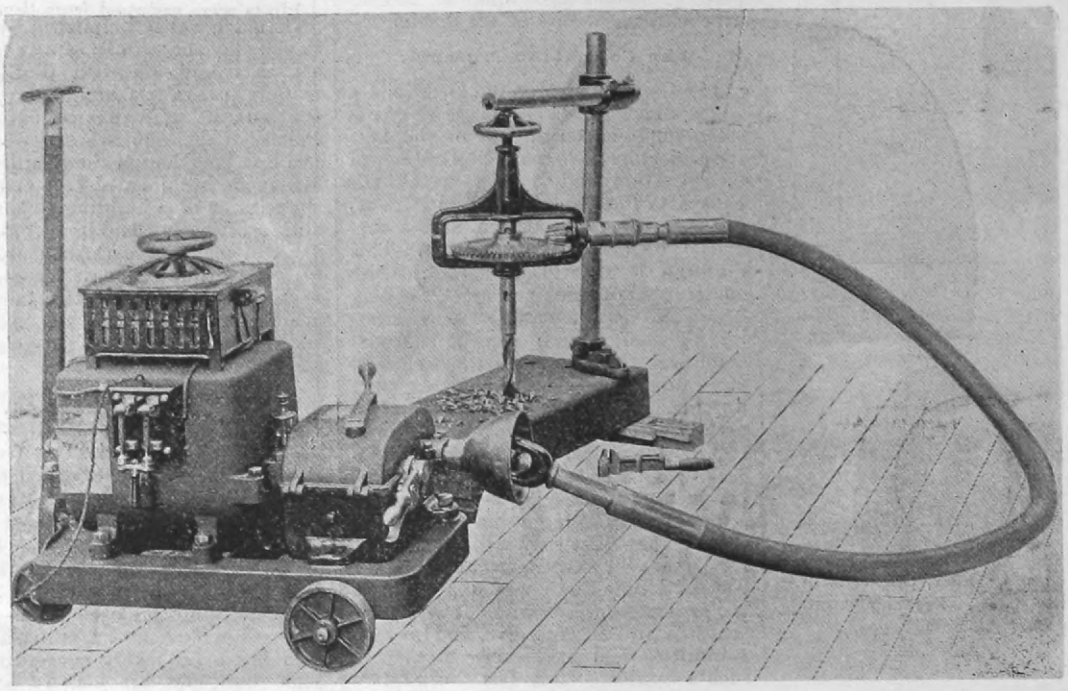
The World's Fair period extended over 183 days, of which 179 were open days, the exceptions being the four Sundays, May 7, 14, 21 and July 23, when the gates were closed to the public and open only to those whose passes denoted they had business in the grounds. Of the 183 days 27 fell on Monday, for Monday opened and closed the fair, while each of the other days showed up 26 times on the World's Fair calendar. Thursday was the popular day, although Monday and Saturday pressed it hard. But Monday's popularity, as shown by the attendance, was not fairly won, for Chicago day, with its 716,881 paid admissions, came on Monday, and it brought Monday's average up.

The daily attendance reports show that 3,621,358 people paid to get into the fair on 27 Mondays, or an average of 134,124; the 26 Tuesdays were chosen by 3,395,308 people, or an average of 130,588; the 26 Wednesdays by 3,208,310, or an average of 123,396; the 26 Thursdays by 3,581,047, or an average

Hosted by Google

of 137,732; the 26 Fridays by 2,875,379, or an average of 110,591; the 26 Saturdays by 3,576,975, or an average of 137,575, and the 22 open Sundays by 1,216,865, or an average of 55,312. The total Sunday attendance did not equal any of the last three weeks' attendance, and the average Sunday attendance was slightly more than one-half Friday's average, the poorest show day of the week. The smallest attendance came Friday, May 5, when 10,791 people paid to pass through the gates. The ten best days were as follows:

October 9—Chicago day	716,881
October 10—North Dakota day	309,294
October 11—Connecticut day	209,277
October 19—Ordinary day	305,961
October 21—Manhattan day	298,928
October 18—Ordinary day	292,458
July 4—Independence day	283,273
October 12—Italian day	275,217
October 17—Ordinary day	267,483
October 27—Coal, grain and lumber	254,763



There were 92 days when the attendance rose above 100,000; 53 days when it passed 150,000; 25 days when it went ahead of 200,000; 11 days when it passed 250,000; four days when it was over 300,000, and one day when it was above 700,000.

The attendance by months does not vary except by moving forward and upward in an accelerated degree. May's attendance was 1,050,037; June, 2,675,113; July, 2,760,263; August, 3,515,493; September, 4,659,871; October, 6,816,435. Total, 21,477,212, of whom 1,253,938 were children.

The total attendance, including passes, was 27,529,400. During the Fair 40,000 monthly and 39,840 full term photographic passes were issued. These, with the complimentary cards, workmen's tickets, trip passes and return checks, were used to the number of 6,052,188. Of this total 1,703,428 represents the return checks, giving a net total of passes of 4,348,760.

The Ferris Wheel.

The Ferris wheel paid $120,000 into the treasury of the exposition since September 9. The Ferris wheel is to the Columbian Exposition what the Eiffel tower was to the Paris exhibition. It typifies the ascendency of American genius on the Plaisance. From June 21 to October 26 the total number of passengers carried was 1,560,000. By a contract with the Exposition Company the Ferris wheel concessionnaires were not required to pay any percentage of their earnings to the exposition until they had taken in $300,000, if the wheel should cost that much, or whatever the actual cost was, if less. The wheel cost about $382,000. From June 21 to September 9 was required to reach the $300,000 mark, and since that date 50 per cent. of the gate receipts have gone into the coffers of the Exposition Company. The greatest number of passengers carried on any one day was 38,750, the number of tickets sold on October 10. Chicago Day is next in line with 35,000 passengers. The number of people who rode on the wheel July 4 was 14,000. The average daily number of tickets sold during July and August was about 9000. About the middle of September the number of passengers increased, and since then the daily average has been considerably over 20,000. No announcement has as yet been made by the management of the removal of the wheel. By the contract the removal of the wheel is not required before May 1, 1894.

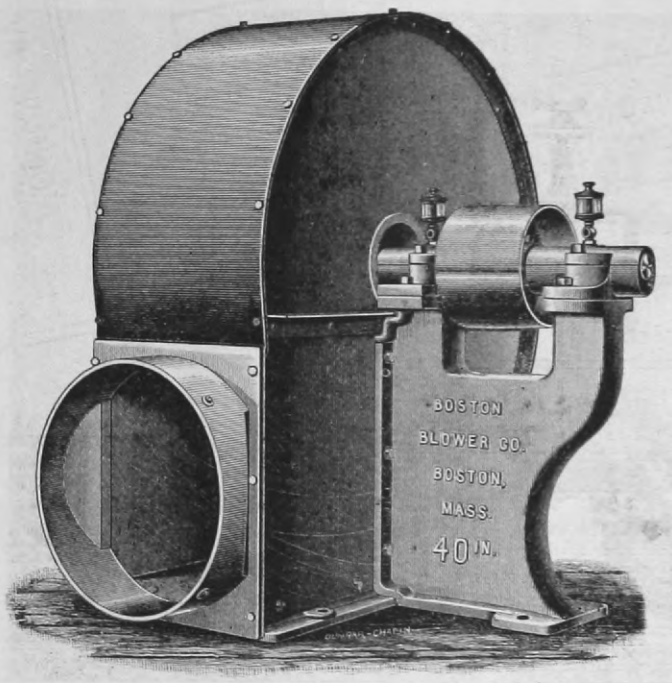
ELECTRIC PORTABLE DRILL WITH FLEXIBLE SHAFT.

Electric Portable Drill with Flexible Shaft.

In that part of the General Electric Company's exhibit in the Electricity Building, World's Fair, devoted to motors and their different applications was shown a portable drill with a flexible shaft. This has been brought into existence to avoid the inconvenience experienced whenever it becomes necessary to drill a piece of metal too large and cumbersome for manipulation under an ordinary upright drill, and to do work usually done with a hand ratchet drill more rapidly.

The machine consists of a motor and a gear box mounted together on a truck, a flexible shaft, a drill press and drill rest. In addition, the motor carries on its side a double pole switch, and on top a starting rheostat. The motor is shunt wound and has two poles, with one spool on the top of the field. The armature is of the Gramme ring type, and its shaft carries a pinion serving to drive the flexible shaft through change and reduction gears, inclosed in a gear box, and running in oil or grease. A universal joint coupling connects the change gear shaft to the flexible shaft, which carries on the drill press end a clutch coupling which may be used for starting and stopping the drill. A second reduction in speed is obtained by the bevel gears driving the drill spindle. The drill press is held by a stand and arm which may be clamped in any position. Increase or decrease of speed is readily obtained by a movement of the side handle; and by another movement the intermediate gears are thrown in or out of mesh when the upper lever slides the change gears into position.

This motor is rated at 4 horsepower and runs at 1000 revolutions, reduced at the drill spindle, according to the three positions of the change gears, to 167, 83 and 12 revolutions. The machine is built for use with drills up to 2 inches in diameter.



The new ferrule brought out by Randolph Clowes of Waterbury, Conn., is the result of considerable experimenting on their part to make some improvement over the old style cast ferrule commonly used by plumbers in making connections. The patent was granted on March 28, 1893, and at once the ferrule was put on the market and has sold in considerable quantities since. By their new process they are enabled to furnish these ferrules to the plumber smooth and made exact to size, which is not the case with the ordinary cast ferrule, which has to be smoothed down by the plumber, and oftentimes the pipes have to be made larger or smaller, as the case may be, in order to fit the cast ferrule. Therefore these ferrules save the plumbers time and labor. As these ferrules are made from seamless drawn brass tubing and then formed up,

Hosted by Google

there can be no blow holes or sand holes. Each ferrule is tested before leaving the works. Since the ferrules are made of seamless drawn brass tubing it is not necessary to have the metal of which they are made so heavy and thick as in the cast ferrule. For a very slight additional cost these ferrules can be furnished with end tinned ready for instant use.

The Boston Steel Plate Exhauster.

The exhausters made by the Boston (Mass.) Blower Company are intended for removing shavings and sawdust from wood working machinery; dust from tumbling barrels or emery wheels, and for use in connection with hot-blast apparatus for conveying and distributing heat to hot rooms or dryers. They are made either single or double, and have heavy steel plate cases and

THE BOSTON STEEL PLATE EXHAUSTER.

jackets secured to angle irons. The angle iron to which the jacket is fastened is on the outside of the case, making it easy to remove if necessary, and at the same time giving a smooth and unobstructed surface on the inside of the machine. The fan wheels are made on heavy T-iron arms, which are cast into a solid cast iron hub, the floats and side plates being securely riveted to the same. These wheels are carefully balanced, as are also the pulleys. The shafts are of steel and the bearings, which are long, are provided with adjustable sight feed oilers.

The hanger, which is bolted to one side of case and extending to the floor, is a heavy iron casting of the box pattern cored out inside, thus securing a very rigid bearing and true alignment.

A free class in architectural and mechanical drawing, under the charge of two instructors, has been started at the Senior Evening School, 58 Fifty-second street, New York. Students of architecture, machinists, stone cutters, carpenters, and persons working at trades in general who would desire to avail themselves of this opportunity can apply on any school evening between 7 and 9 o'clock.

The World's Fair Awards.

There seems to be a good deal of misapprehension concerning the World's Fair awards, which is encouraged for selfish purposes by some. A Chicago newspaper explains the system as follows:

"At most former international expositions the prize medal system has obtained. Advocates of the system followed here in Chicago say the prize medal system is faulty in that it disregards elements of excellence. Under that system an exhibit may receive a medal, yet be an inferior article. A maker of poor chocolate might receive the highest award because other chocolate makers had not made exhibits. In such a case the medal would be no guaranty of the high quality of the chocolate—merely an evidence that it was the best brand of chocolate shown; and it might be the only one shown. Under the system governing the award of medals and diplomas at the World's Fair, the several elements of excellence are all noted. For instance, a judge of furniture examines a chair. He considers that chair, not in comparison with other chairs on exhibition, but as a single chair apart from all other chairs. He notes its form, the quality of material used in its construction, the workmanship, and the character of the finish. If it be up to the standard, it receives a medal and a diploma. In the diploma the several points of excellence are set down minutely. That chair may not be the best chair in the world, but it must be a good chair, else it would not receive a medal. Its good points are all enumerated in the diploma. A medal or a diploma from the World's Columbian Exposition is, therefore, a guaranty that the exhibit which receives a medal has high merit. Only one medal goes to any exhibit, but the number of diplomas under that one medal may be indefinitely large. For instance, a watchmaker would receive only one medal for his exhibit, but he might receive a diploma for his gold watches, his silver watches, his ladies' watches, his gentlemen's watches, his hunting-cased watches and his open-faced watches.

"Under this system of awards the examination of the exhibits to determine those entitled to medals and diplomas was done by individual judges. This point also caused some friction early in the summer. The foreign exhibitors wanted to follow the European plan of having awards determined by jurors. Under the European plan, the jury on agriculture would determine all the awards for wheat, oats, tobacco, beer, condensed milk, coffee, Peruvian bark and linseed oil. At the World's Fair an expert judged each class of exhibits. A disinterested expert on wheat judged wheat, and so on through the list."

As we understand it a number of exhibits were assigned from time to time to each juror of a certain section. He made his report, which was submitted to the whole jury, of that section, and was accepted or rejected by it. There have been no "highest awards," or "first prizes," in the sense that it is usually understood. The medals are all of equal value, but the diplomas, which are based on the report of the jury, are worded in a widely different manner. They may make mention of specially meritorious points on which other diplomas given to competing goods are silent. It is the matter contained in the diploma which ranks the award.

The Queen & Crescent Route has issued a new Eastern tariff, effective November 1, giving the rates of freight on cast iron pipe in carloads of 30,000 pounds minimum. The rates to some of the more important points are given below:

To	From—Anniston, Bessemer, Birmingham, Pell City and Piedmont, Alabama.	Chattanooga, Tenn.
Albany, N. Y.	6.25	6.00
Allentown, Pa.	6 25	6.00
Ansonia, Conn.	6.85	6.60

Troy, N. Y.	6.25	6.00
Watertown, N. Y	7.20	6.70
Windsor Locks, Ct.	6.85	6.60

By official statistics it is found that there were last year 1,109,014 *bona fide* members of trade unions in England. The number of unions was 431, with an aggregate capital of $8,617,500 on hand. The sum of $970,665 was paid during the year as unemployed benefits.

Works of the Bucyrus Steam Shovel & Dredge Company.

This company was originally established at Bucyrus, Ohio, about ten years ago. From small beginnings it grew and increased, and the original ground on which it stood became so crowded that a new establishment became necessary for the carrying on and development of the business.

The work executed by this company is divided into specialties, as follows: Steam shovels, light dredging machinery, heavy dredging machinery, railroad and locomotive cranes and wrecking cars, placer mining machinery, Bucyrus amalgamator system. Under these headings are included a great variety of auxiliary appliances and machines connected with similar work, such as centrifugal pumps, ballast unloaders, pile driving machinery and machinery for public works.

The recently completed plant is located at South Milwaukee, Wis., on the line of the Chicago & Northwestern Railway 10 miles south of the city of Milwaukee. The ground occupied comprises 15 acres, divided into the main establishment, and shipyard located on the harbor on the lake shore, ¼ mile distant. Here a private and commodious harbor is secured with ample dock facilities, and connected with the main works by a belt line railroad.

The general plan of the buildings and a cross section of the machine and erecting shops are shown in the accompanying cuts, Figs. 1 and 2. The buildings are of steel, brick and glass, and comprise the following: Offices, 40 x 60 feet, three stories; main building, 120 x 240 feet, with overhead traveling electric crane the entire length; smith shop; plate and structural iron shop; foundry, with overhead traveling electric crane; pattern shop, carpenter and wood shop; pattern store house; general store house, power house. Referring to the map, it will be seen that the works are planned with a view of systematic extension so that the capacity can be more than doubled as future requirements demand, and the works when thus added to will be a complete and systematic whole. The defects which are so manifest in nearly all great establishments which are the result of growth will thus be obviated.

The buildings are heated by the hot blast ventilating system. A complete system of standard gauge tracks connects all the buildings with each other, and likewise a narrow gauge track for hand trucks, as indicated on the plan, and a transfer table provides access to the construction tracks in the end of the main building.

The distinguishing features of the plant are that all the buildings, with the exception of the offices, are ground floor only, and that electricity furnishes the sole means of distributing power throughout the entire works.

The reasons for adopting electric distribution of power are as follows:

1. It permits of complete isolation of the boiler and power plant from all of the buildings.

2. It permits the ready and convenient distribution of any desired amount of power to any desired place and at any desired speed.

3. It avoids the wear and tear and loss of power on machines that are used occasionally or intermittently.

4. The electric system lends itself to a variety of subsidiary uses, such as electric light, electric welding, electric traveling cranes, electric portable drills, &c

The power is distributed from a central power house to the various localities where power is required, as follows:

Two motors, 15 horse-power, machine shop; two motors, 5 horse-power, boiler shop; two motors, 5 horse-power, pattern shop; one motor, 15 horse-power, smith shop blower; one motor, 15 horse-power, cupola blower; one motor, 5 horse-power, casting shop; three motors, 4 to 12 horse-power, foundry crane; three motors, 5 to 15 horse-power, erecting shop crane; total, 15 motors and 166 horse-power. Two multipolar generators each of 150 horse-power (one of which is a reserve), driven by a Corliss engine, are employed.

The largest motors and generators are of the slow speed type so that connection can be made from the motor direct to the line shaft with one belt.

Referring to the illustration, it will be seen that the roof of the main building is 120 feet span, divided into one central span of 60 feet and two side spans of 30 feet. One of the side spans is used as a machine shop for the lightest tools, and the heavy tools are placed out along the edge of the central floor so as to be under the field of the overhead traveling crane. The smaller machine tools in which the work to be lifted is beyond hand power are served by compressed air hoists suspended from light jib cranes attached to the wall or to the pillars of the building.

Compressed air is used for the foundry hoist to the cupola platform, and an air cylinder having a tubular plunger is sunk in the ground and operates the elevator platform by direct lifting. Compressed air is used for blowing out cylinder castings and for testing small engines in the erecting shop.

The compressed air is furnished by a duplex air pump of the American air brake type, as used on locomotives. This is placed in the engine room, and a receiver kept charged at all times to the requisite pressure. There is no accumulator, and the apparatus is entirely automatic in its action.

The offices of the company are located in a separate building. On the ground floor are the business offices, with the general manager, superintendent and secretary. The whole of the

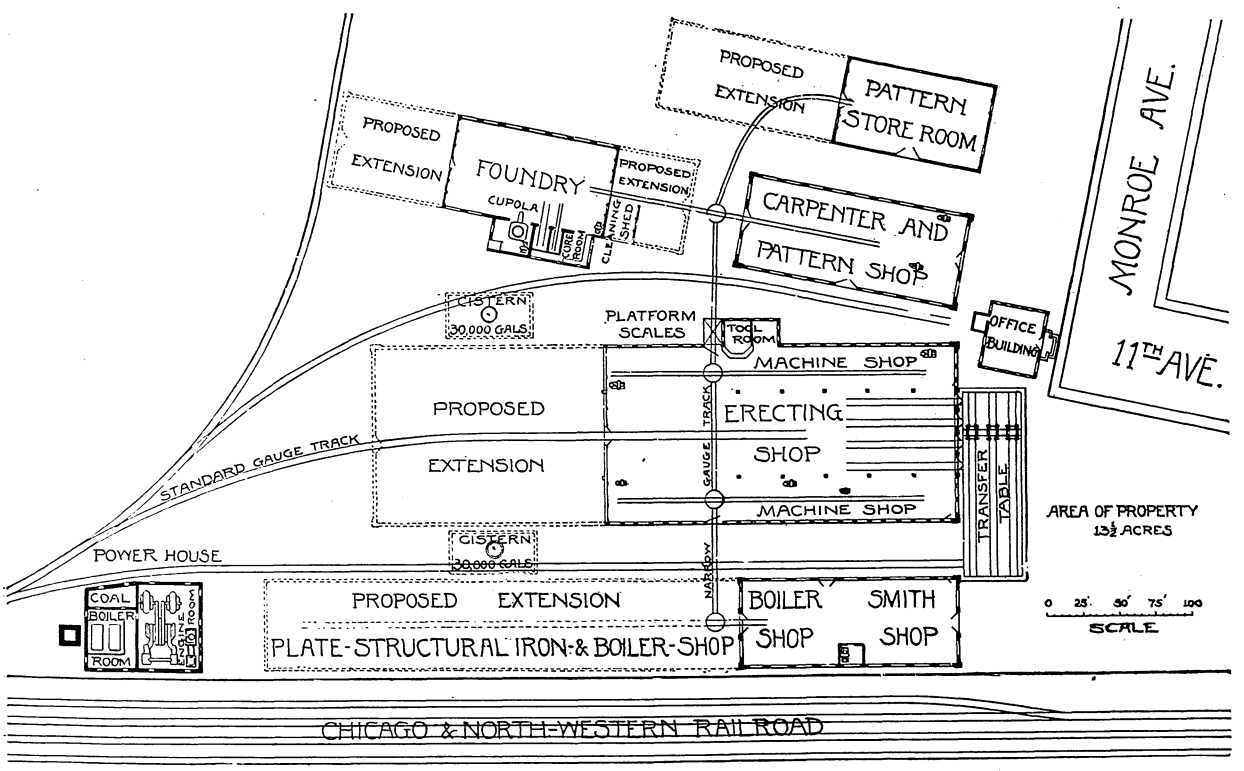

Fig. 1.

WORKS OF THE BUCYRUS STEAM SHOVEL & DREDGE COMPANY.

Hosted by Google

second floor is devoted to the drawing office, with the chief engineer's office, which has accommodation for 14 draftsmen.

The work turned out by this company is of a very high order and of a varied description, necessitating a very complete system of records. The range of work runs from the lightest sectional steam shovel, capable of being transported on a mule's back, to the largest sea going dredge of 10,000 cubic yards capacity, and the dredges that have been already built number over 20 sizes, running up to the most powerful dredges in the world. The officers of the company are as follows: Wm. Hamilton Harris, president; H. P. Bolls, vice-president and treasurer; A. B. Stetson, superintendent; W. B. Crittenden, general manager; A. W. Robinson, chief engineer; J. M. Millman, secretary.

English Steel Production.

The production of Bessemer steel in Great Britain during the first six months of the current year is given in the report of the British Iron Trade Association, just issued. It shows that the total production of Bessemer steel ingots was 784,712 tons, of which 656,774 tons were acid and 127,938 tons were basic material. By districts the production was as follows:

Districts.	Acid.	Basic.
	Tons	Tons.
South Wales	209,909	.....
Northeast Coast	95,136	77,673
Sheffield	77,177	22,949
West Cumberland	156,174	.....
Lancashire and Cheshire	118,378	.....
Staffordshire, Scotland, &c.	.....	27,311
Totals	656,774	127,938
Total production, 1892	544,399	105,417

During the same period of 1892 the Cleveland district produced 39,878 tons of basic material, and Staffordshire and Scotland 47,659 tons, representing an increase in the first instance of 37,809 tons, and a falling off in the second case of 20,348 tons.

The production of Bessemer steel rails for the first six months of 1893, 1892 and 1891 is shown in the following table:

Districts.	1893.	1892.	1891.
	Tons.	Tons.	Tons.
South Wales	59,078	60,634	70,763
Northeast Coast	83,839	36 346	104,293
Sheffield, &c	11,262	12,995	29,89
West Cumberland	92,678	60,000	141,204
Lancashire and Cheshire	70,528	41,909	75,868
Totals	317,395	211,884	422,623

It is stated that the decline of 210,739 tons as between 1891 and 1892 appears to have been recovered during 1893 to the extent of 105,511 tons. The Northeast Coast and West Cumberland districts have recovered more largely than any of the others, but in the latter district one of the largest works, that of West Cumberland, is still entirely laid off.

The total number of converters in operation in Great Britain on the last day of June, 1893, was 62, as compared with 65 in operation at the same time last year.

Railway Building in 1893.

In spite of the financial stringency and general business depression of the past few months, the work of railway construction has gone on uninterruptedly in 42 of the 48 States and Territories of the Union. The *Railway Age* calculates that 2040 miles of track were laid in the first nine months of this year on a total of 182 lines, over 1000 miles having been constructed since July 1, when the panic was at its hight. There is in sight, besides, sufficient unfinished work to make the total length of new track for 1893 at least 3000 miles, but it is hardly likely, considering the number of enterprises that have been temporarily posponed by the monetary stringency, that the total for the year will much exceed 2500 miles. Yet under the extraordinarily unfavorable conditions that have prevailed of late months, this showing will be anything but a bad one. The only wonder is that construction did not altogether cease, and the fact of this substantial addition having been made to the railway facilities of the country under such adverse circumstances shows the urgency of the existing demand for additional steam transportation facilities. The only States which have not secured new tracks during the year are Vermont, Connecticut, Delaware, Maryland, Nevada and the Indian Territory.

Brown Segmental Wire Gun.

The Brown Segmental wire gun, during the Government test at Sandy Hook on Thursday last, gave the highest velocity ever known. The following is the official report of Capt. Frank Heath of the result obtained on that occasion: With 30 pounds of the Leonard smokeless powder and a 60½-pound shot, a muzzle velocity of 3130 feet per second was obtained, with a breech pressure of 53,800 pounds per square inch. This exceeds any record ever obtained with any gun of similar length, with equivalent weight of shot, and is ahead of the previous world's record obtained with the same gun and powder on August 18, 1893. Thursday's record gives a muzzle energy of 4216 foot tons, which is equal to 1016 foot tons for each ton of weight of gun, and to 140 foot tons for each pound of powder burned. The pressure of 53,500 pounds per square inch is the ordinary battering pressure of the Brown wire gun. It will be noticed that the powder charge used was one-half of the weight of the shot. So far as known the Brown gun is the only gun in existence which admits of the use of such a charge of smokeless powder, and the velocity far exceeds anything ever obtained proportional to the pressure, with any powder in the world for the same weight of shot and length of gun. With an armor piercing projectile the velocity obtained would have been sufficient to penetrate about 19 inches of wrought iron or 13 inches of steel armor.

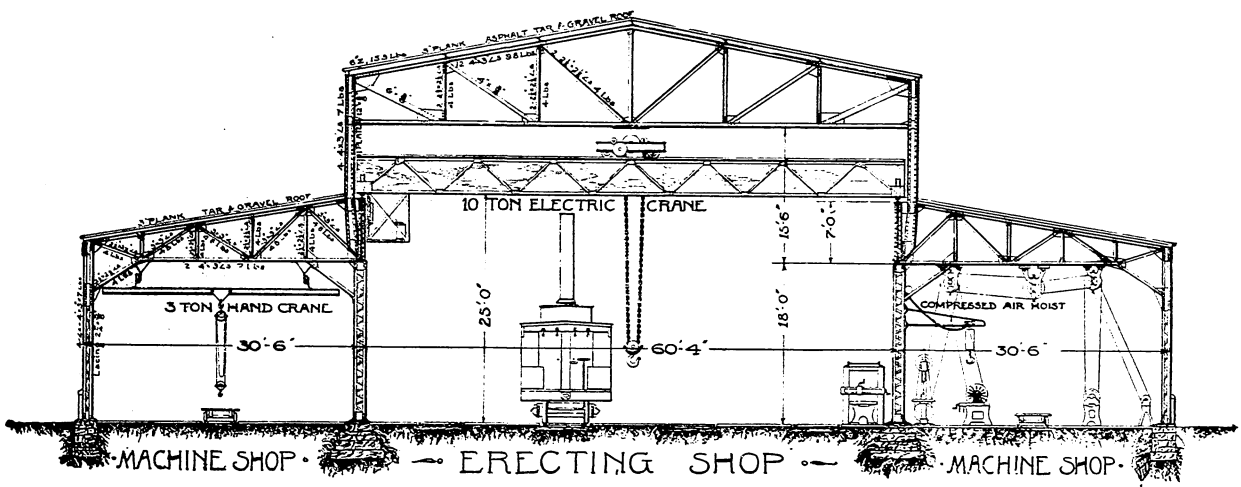

Fig. 2.

WORKS OF BUCYRUS STEAM SHOVEL & DREDGE COMPANY.

The coinage of gold in the United States mint in Philadelphia during October was the heaviest in the history of that institution. Over half of the $15,000,000 ordered by the Treasury to be coined by December 1 was turned out.

Modern Fixed Ammunition*

BY HAROLD THOMAS ASHTON.

Continuous improvements in the loading and firing arrangements of firearms of all calibers and in their ammunition have been made, the end in view throughout having been to obtain the maximum efficient speed of firing by rendering the operations of loading and discharge as simple as possible, and so allowing the principal attention to be directed to aiming the shot. This final simplicity in action, in which the ammunition plays the principal part, has only been arrived at by the most elaborate preparation of the implements and materials used, with the result that the manufacture of a modern small arm or quick firing cartridge is not often excelled, either in the care exercised in the selection of the material and the multiplicity of the operations performed upon it or in accuracy of workmanship.

A complete cartridge is made up of: 1, Case; 2, explosive charge; 3, means of ignition; 4, projectile.

While the bullet, charge and means of ignition are essential for the use of firearms, the case is a comparatively modern addition, and merely a means of uniting the other components in a convenient manner, although at the same time it is the most important element in the safety of and ease of handling the cartridge. The functions of the case before firing are to form a tightly sealed receptacle for the explosive charge and the means of ignition and a holder for the bullet. In the act of firing its duty is to form an elastic gas check, preventing all escape of explosive gases past it; and after firing to free itself readily from the firing chamber.

The qualifications of a good cartridge case are therefore: 1, That it should be as strong and rigid as may be required for transport; 2, that it should fit easily but accurately into the firing chamber; 3, that it should retain sufficient elasticity to return approximately to its original dimensions after the pressure of the explosive gases expanding it tightly in the chamber has been released; 4, that it should be as light as is consistent with the strength required in it to resist rough usage and exposure in all climates and under all conditions; 5, that—since in all but the larger sizes of cases, to which this condition does not therefore apply, it has been found rarely possible to use a case more than once—the first cost should be as small as possible.

Attempts to fulfill these conditions have caused the paper case, which was consumed in the explosion and used in rifles carrying a permanent gas check in their breech action, to be replaced successively by a stronger paper case with a metallic base; by the rolled case still used for the Martini-Henry rifle, in which the thin sheet brass forming the body is used in much the same manner as the paper that preceded it; and finally by the solid drawn brass case, which has been adopted universally without material variation.

The body of the case contains the explosive, and when charged is closed at the front by the projectile. The thin walls form the gas check, which is completed by the strong base, in which is formed a central chamber for the primer. Round the base is a projecting rim or head, or an annular groove, serving as a means of extracting the empty case from the firing chamber. The groove is more convenient for the purpose of packing, but it does not give so certain a hold for the extractor as the projecting head, which has accordingly been adopted in the British service.

Some of the larger cartridge cases for use in quick firing guns have been made with the base attached to the solid drawn body by riveting or screwing, chiefly as a measure of economy in the appliances used in manufacture; and smaller cases have been similarly designed, various advantages being claimed for them; but cases of this description do not supplant to any noticeable extent the solid drawn case above described. Until recently only small arms were supplied with fixed ammunition, but its use now extends to a variety of quick firing guns, the largest of which are of about "6" caliber. Its usefulness as a means of increasing the speed of firing is, however, diminished, and finally disappears, as the weight of a cartridge increases and becomes inconveniently heavy for dealing with by manual labor; and on this account the heaviest complete fixed ammunition in the British service is that made for the 6-pound quick firing gun, the cartridges used for the 4.7 and 6 inch guns having only the charge and means of ignition contained in the case, which is carried and loaded separately from the projectile. In contrast with these, the smallest varieties of fixed ammunition are those made for revolver pistols and practice with the Morris aiming tube.

As the manufacture of all kinds of solid drawn cases is conducted on the same lines, it will be sufficient to follow in detail the construction of the cases used in the Lee-Metford rifle, which may be taken as a type of the small arm cartridge cases adopted for the armies of the civilized world, and are made in the greatest numbers, with the greatest accuracy, and present on the whole greater difficulties in manufacture than any other variety.

Preparation of Material.

The material found to be most suitable for these and all other solid drawn cases (other than some of the smallest, which are of copper, and might be made of almost any ductile metal)—combining the strength and ductility necessary to withstand the heavy stresses to which it is subject during manufacture and in use, while being comparatively cheap—is an alloy of copper and zinc in the proportion of copper, 65 per cent. to 70 per cent., and zinc, 35 per cent. to 30 per cent. Small quantities of lead and iron are found in the best cartridge metals, but their presence is not particularly desirable. The total amount of metals in the alloy, other than copper and zinc, should not exceed 1 per cent. Only the purest brands of copper and spelter can be used with success for this alloy, and in casting it into ingots every care has to be taken to obtain them absolutely sound and free from all impurities such as scale or other foreign matter, which, together with blow holes, are the greatest enemies to success in its subsequent manipulation.

The ingots are cast in iron molds, already hot from the effects of previous use, and prepared by a rub down of seal oil and resin, or some similar varnish, to give a good surface to the casting. With a view of obtaining sounder metal, small quantities of phosphorus and aluminum have been introduced into the alloy, but experiments have failed to show that the results are beneficial or the reverse. Entirely new metal does not work as well as that cast from a mixture, of which scrap cuttings, made in various processes in the manufacture of the case, form a large portion. Also, curiously enough, better results have followed where charges have been made from copper and spelter of certain brands and a scrap cast from different brands, than from charges in which the same brands of copper and spelter, used as a new metal also, solely compose the scrap metal of the charges; although no difference sufficient to account for the result was to be found by chemical analysis. It is also advantageous to have ample heat at command, that the charges may be melted quickly and with the smallest possible loss of zinc.

The exact dimensions of the ingots are to some extent a matter of convenience, provided that the thickness is such as to insure sufficient work being put on the metal in rolling to thoroughly solidify it. The possible importance of this may be indicated by the fact that an alloy has actually been made entirely by incorporating by pressure the two constituent metals in a fine state of division. The width of the ingot is dependent on the design of the machines used in the operations immediately subsequent to the rolling, and the length is limited by the facility in handling when the ingot is elongated in the rolls. The ingots for the manufacture of the Lee-Metford cartridge case are cast about 0.75 inch thick, and 2.25 to 4.5 inches wide, and about 2 feet 6 inches long. After they have been trimmed they are rolled down into long narrow strips 0.14 inch thick. By the earlier or breaking down rolls they are reduced much more in thickness than by the later, and they are annealed at intervals.

Formation of Cups.

The metal silp thus produced is passed, after having been trimmed and examined, through machines which punch out from it circular blanks 0.875 inch diameter, and at once form them into cups in the same die, Figs. 1 and

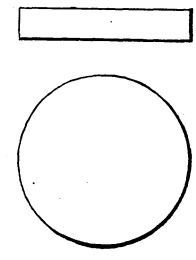

Fig. 1.—Blank.

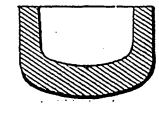

Fig. 2.—Cup.

2. This die has a hole passing completely through it, made in two diameters; the first and larger of these, served with an annular punch, cuts the blank, which momentarily rests on the shoulder half way through the die, and is then, by a central punch working inside the annular cutting punch, thrust through the hole of smaller diameter and formed

into the cup. This operation, by straining the fibers of the metal over the dome and corners of the cup, serves to show any surface defects in the metal which have previously passed unnoticed, and at each subsequent stage in the manufacture of the case further torture of a similar nature reveals any defects existing in the metal as cast in ingots. The amount of metal at the end of the cup forming the embryo case cannot be augmented in the course of manufacture, and is even somewhat reduced. The quantity of the metal required in the head of the finished case therefore determines the mimimum thickness of the strip from which the cup is formed, and consequently the amount of work which has to be done to extend and reduce the walls to the thickness required in the finished case, in the drawing operations to which the cups are subjected after they have been annealed.

Drawing Operations.

There are five drawing machines used in the manufacture of the case under consideration, and by them the principal work of manufacture is done, and from their nature the "solid drawn" case derives its name. These machines are all similar, and are only distinguished by each being fitted with the particular tools required for its share in the work. The cups, having been fed by hand into holes in a revolving table, are carried under a reciprocating punch, driven by an ordinary crank, connecting rod and slide, which, advancing in due course, forces them one at a time through the drawing die, which reduces their diameter and thins and extends their walls. Each case, adhering closely to the punch, upon which it is tightly compressed during its passage through the die, expands slightly when the passage is complete; while at the same time the die, relieved from strain, contracts; so that the sharp edges of the die catch on the edges of the case on the return of the punch, which is thus cleared in readiness for the next stroke. The punches and dies are copiously lubricated with soap and water to reduce friction and to prevent the work from being scored. In each drawing operation as much work is done upon the metal as is possible without permanently injuring it, hardening it considerably and causing it to require thorough annealing before the next operation. All the annealings, five in number, are conducted in the same manner. The cases are heated in covered pots or muffles to a dull red heat corresponding with about 650° C., and then allowed to cool slowly. Great acccuracy in temperature is not necessary

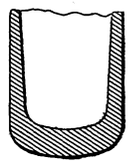

Fig. 3.—First Draw.

to insure a satisfactory result, but care must be taken not to overheat the work, especially in the later stages, when the walls have been thinned. After annealing, the surface of the metal is cleaned by dipping it into dilute sulphuric acid. The drawing or extending operations do not succeed one another immediately in the development of the case, but are interrupted by the first indenting operation, in which the cap chamber and head take rudimentary shape.

Indenting and Trimming.

There are two indenting operations in all, and the first is effected preferably after the first draw, and the second after the fifth draw. They are similar in manner, and, like the several draws, only differ in degree. After being indented the first time, the case appears as at Fig. 4, and after the second indenting as at Fig. 9. The results of the successive drawing operations are shown in Figs. 3, 5, 6, 7 and 8. For indenting, the case is supported internally by a bolster fitting it accurately and externally by a die. A suitably shaped punch is then driven into the base of the case, displacing the metal from before it and forcing it to flow backward along the annular space between the punch and the supporting die. For this purpose the cases are fed by hand into the feeding slide of automatic machines, and are delivered by carriers in front of the operating tools, which act in the order given by means of cranks, cams, or a combination of the two, and are freed from the work by a stripper. When the cases leave the drawing machines their mouths are left with somewhat ragged edges. This is due partly to irregularity in the flow of the metal and partly to the impossibility of keeping the punch and die absolutely in truth. As the mouth of the completed case must be of uniform substance and strength to prevent it from splitting when the cartridge of which it forms a part is finished, enough metal is provided in cutting the blank to make it, as it leaves the last drawing machine, considerably longer than is ultimately required. The surplus length is cut off in a machine

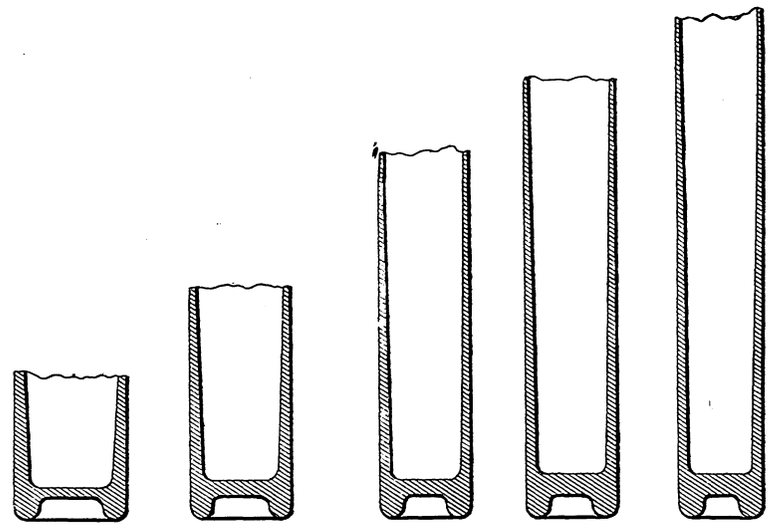

Fig. 4. 1st *Indent.* *Fig 5.* 2d *Draw.* *Fig. 6.* 3d *Draw.* *Fig. 7.* 4th *Draw.* *Fig. 8.* 5th *Draw.*

in which the cases are either fed by hand or by automatic feeding gear on a mandrel, or into a revolving spring chuck. A rapidly revolving circular cutter is then moved up against the case automatically, or by hand, and shears off the metal.

Heading.

Heading the case after it has thus arrived at its full length, Fig. 9, is a most important operation, for on it depends the perfect freedom from escape of gas about the cap or primer, as well as the ready extraction from the chamber of the rifle after firing—two of the most important points determining the efficiency of a cartridge case. Heading consists in upsetting the base of the case, in which there has already been formed a deep indent, so as to form the projecting rim on its circum-

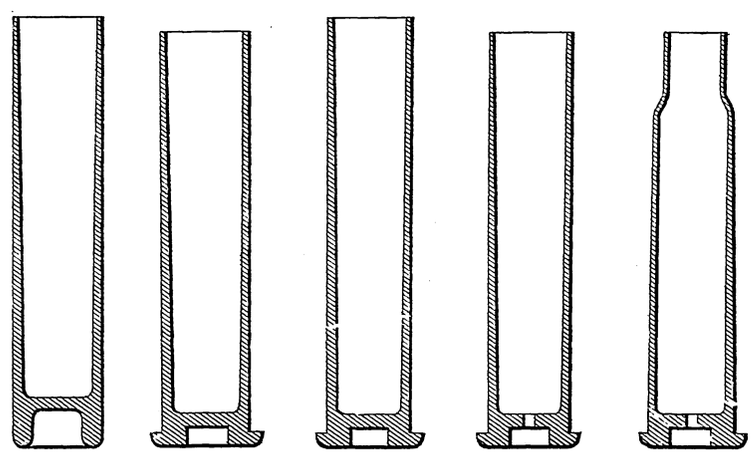

Fig. 9. *Trimmed and Indented.* *Fig. 10.* *Headed.* *Fig. 11.* *Coned.* *Fig. 12.* *Pierced, &c.* *Fig. 13.* *Necked.*

ference and the cap chamber at its center, and at the same time to solidify the surrounding metal. The case after heading is shown in Fig. 10. The case is supported in the heading machine internally by a bolster and externally by a cylindrical die. The die does not, however, inclose the whole length of the case as in the indenting operation, but leaves a short portion projecting, sufficient to form the rim when upset. The heading tool, which is then impressed upon the case, consists of a dished die with a central projecting nipple of the exact size of the finished cap chamber. Just enough taper is given to the nipple to allow it to free itself after operating and leave the case on the bolster. Great care has to be exercised in making the indent in the base of the case before heading. If made too large the metal closes on the nipple in folds in the heading operation instead of homogeneously, and if made too small unnecessary work is thrown upon the nipple, which it is important to avoid, as only 0.001 inch latitude is allowed in the diameter of the finished cap chamber, so that the life of the tools is of necessity very short. The heading machines are of various kinds. In some of the earliest the cases are placed by hand on the bolsters, which, together with the supporting dies, are carried by a revolving table under a reciprocating heading tool driven by an ordinary crank, connecting rod and slide. Later machines have only one die and bolster, and in them the cases are fed by hand into the slide, from which they are taken mechanically and placed opposite the operating tools, which are brought to their work in the requisite order by cams or cranks.

Tapering.

The cases are next passed slowly over rows of gas burners, the flames from which play only on their mouths, thus softening them for a short distance up the body while leaving the base and body hard. This is done in order that the walls of the cases may easily adapt themselves to the tapering operation, which follows immediately, and to the necking or reduction in diameter of the mouth of the case, which takes place after the charge is inserted. The case is tapered or coned by two machines, in each of which it is forced into a die having a suitably shaped central cavity. In the first machine most of the reduction in the diameter of the case near the mouth is effected, and in the second the die gives to the body of the case the straight taper shown in Fig. 11, which is required to render insertion into and extraction from the firing chamber easy. After the head has been turned, the distinguishing marks stamped on its base, and the fire hole at the base of the cap chamber pierced, the case is cleaned. The cap chamber is then rectified, the mouth of the case rehammered, and it is passed on to be examined and loaded, after which the final operation of necking takes place.

Work is being pushed on the defenses of Boston harbor. The undertaking will include an armament of 12 12-inch guns, 15 10-inch and 5 8-inch guns, 128 12-inch mortars, and submarine mines to be operated from four mining casemates.

A steamer built recently in England, to run between London and Paris direct, has mast, funnels, boats' davits, flying bridge and other deck erections all made to lower, in order to enable the vessel to pass under the low bridges of the river Seine.

English Pig Iron Production.

The British Iron Trade Association has published its usual report showing the production of pig iron in the United Kingdom in the first half of 1893. The amount produced during the first six months was 3,665,537 tons, against 2,790,918 tons for the corresponding period of 1892, or an increase of 874,619 tons. It is pointed out, however, that the decrease in production of the first six months of 1892 over the same period of 1891 was 921,000 tons, due in a large measure to the Durham strike of 1892, and that consequently the increase noted above is more apparent than real.

The production by districts is given in the following table:

District.	First half of the year.	
	1893.	1892.
Cleveland	1,364,285	600,819
Scotland	443 000	466,000
Cumberland	315 822	222,747
Lancashire	333,336	236,505
South Wales	368,341	332,087
Lincolnshire	105,692	109,847
Northamptonshire	88,833	88,098
Derbyshire	102,291	138,548
Notts and Leicestershire	132,321	137,624
North Staffordshire	106,900	98,573
South Staffordshire, &c.	152,215	170,135
South and West Yorkshire	102,967	124,789
Shropshire	20,080	25.335
North Wales	22,964	22,312
Other districts	6,540	17,499
Totals	3,665,537	2,790,918

Since the end of June 96 furnaces have been blown out in Great Britain, while only six have been started, leaving a net decrease in the number of furnaces in blast of 90, or representing a falling off in production of 1,530,000 tons annually.

The stocks on June 30, 1893, in producers' hands and in warrant stores amounted to 786,057 tons, or an increase of 85,607 tons over the first six months of 1892. The principal holders were Scotland, 336,383 tons, and Cleveland, 192,786 tons. It is stated that the present stocks of pig iron, taken as a whole, would not be equal to more than a month's capacity of the furnaces generally, and this fact is alluded to as one of the few satisfactory features of the present situation.

Brazil's domestic troubles are seriously crippling her foreign trade. Baltimore journals mention that shippers and importers at that point are feeling the interruption of commercial relations acutely. The coffee imports from Rio largely center at that port, which is also the seat of an important export trade in flour, provisions and manufactured goods to Brazil. This trade has been of late at a standstill.

Supervising Inspector-General Dumont, in his annual report as to steam vessels and steam boilers, recommends a change in the law which limits the thickness of the shells of externally fired boilers to 0.26 inch, so as to allow such boilers to be built of material of 0.31 inch thick.

Washington News.

(From our Special Correspondent.)

WASHINGTON, D. C., November 6, 1893.

The parliamentary attempt to secure the sanction of the House to a report of the projected Tariff Revision bill of the Committee on Ways and Means to the clerk of the House during the adjournment and the practical exclusion of the minority from participation in the measure, either by consideration in committee or in submitting a minority report, caused such a breeze that the scheme was compromised to the satisfaction of the minority end of the committee.

The work will now go on and when ready the minority members will be furnished with a copy of the bill and ten days will be given them for the preparation of a minority report. Chairman Wilson said immediately after the adjournment: "We will now work on long hours and make substantial progress on the bill and may expect to report it in about two weeks.

"There may be some radical departures from the details of former measures of a similar character, but this will be more in certain lines than in rates. The free raw material idea has long been advocated in sections where previously the tariff on protective lines was strongly advocated. We believe that certain raw materials free will be an actual benefit to manufactures in general. Certainly free coal, now 75 cents a ton, would be popular in New England or California, or wool in the textile sections, or iron ore, now 75 cents a ton, in the iron manufacturing districts.

"The customs law of 1883 was a very carefully prepared measure, based upon most extensive hearings and investigations by an expert commission. The act of 1890 was based upon no such range of inquiry. Public sentiment on that measure was expressed several years ago. It has also most seriously crippled the Government by its prohibitory rates, which have made severe reductions in the revenues. A revenue tariff will afford ample protection and at the same time produce revenue. The losses in that direction by placing certain articles on the free list can be made up from other sources, although lower rates commensurate with the benefits of free raw materials may be fixed."

The metal schedule will be very thoroughly overhauled and the rates reduced, but to what extent has not been definitely settled.

It is proposed to make a cut on pig iron, round iron, beams and other structural shapes, plate, hoop, railway bars and rails, sheet, wire rods and wire.

Pig iron at $\frac{3}{10}$ and railway bars and rails at $\frac{6}{10}$ cent a pound are the target of a lower rate, but the majority are not fully agreed to any reduction there, although it may be anticipated. The question of retention at the committee's rate will then have to be fought out in the House.

It will not be long before the new bill will be completed and printed, but it will be some time thereafter before it will receive concurrent action of the two Houses, and when it does reach that stage it will be somewhat modified and changed.

Arrangements are being made for holding a great Scandinavian Industrial Exposition at Malmö, Sweden, in 1896.

An Export Trade in Heavy Iron and Steel.

The low prices at which American iron and steel are selling in our markets have suggested to some not familiar with the situation outside of our country that we may become exporters on a scale of some magnitude. Some journalistic wiseacres are encouraging this impression, and in that way are doing harm. While we are convinced that this country will ultimately take its place as an important contributor to the world's markets, it is sure that the present range of values keeps us out of the race. Possibly when the next depression comes, and American manufacturers have learned to further reduce costs, then it may be wise to look about for means of developing an export trade in heavy iron and steel.

A few figures will suffice to put an end to all this talk of an export trade. Bessemer pig is selling at $11.25 in Pittsburgh. Add $2.80 for freight, and a tidewater price of $14.05 is reached. The ocean freight, insurance, &c., would carry this up to $15 at the very lowest as the cost delivered to an English port. This is at least $3 per ton above the price there, and cuts off any possible chance in neutral markets.

Possibly American steel billets might be sold at $20 per ton at tidewater, although the market is really closer to $20.50. Now foreign billets are quoted, delivered New York, at $28.50. The duty is $8.96, so that foreign billets are selling, c.i.f. New York, lower than the American material. The only effect the lowering of the American price has had is to stop importations of common foreign billets for the export wire trade, under the drawback arrangement, because it has ceased to pay. In any case the Germans have done what business there has been, because they undersell the English makers. English quotations have no value, therefore, when comparing foreign and domestic billet prices.

Of course these are lines in which the only foreign markets are the home markets of our competitors. But in all rolling mill products which might go to common markets in other parts of the world we would be invariably beaten, except where reciprocity treaties give us the advantage. American bridge builders have in the past taken work in Central and South America, but that was because they built light pin connected structures, which foreign engineers have since then learned to imitate. Lately bids for 550 tons of girder work for a Japanese railway have been submitted here, but aside from unfavorable financial arrangements, our bridge shops acknowledge that they cannot figure down low enough.

An occasional job in architectural iron work does come up for some public building, as was the case of a theater in a Venezuela town recently. But that comes to us because we are the pioneers in some classes of steel construction, and not because our material is low enough to allow us to compete on a tonnage basis.

A little export business is being done in bars made from scrap iron, but that is merely local and does not cut any figure. We have, however, done quite a respectable trade for many years in cut nails, since that has been an American specialty. We are doing a growing business in wire nails and barb wire, basing it all, until lately, upon foreign raw material. There is not much relief to our markets in that.

In the whole lines of crude materials and rolling mill products we have no right whatever to expect an export trade of any consequence, except possibly with some parts of Canada. There is an animus in the assertions to the contrary which one need not go far to see.

The Lesson of the Fair.

It is interesting and to some extent amusing to read what various writers have to say regarding the results of the Chicago Exposition. The magnitude of that enterprise in its every aspect has been an incentive to grandiloquent speech whenever the topic has come up for discussion. It has inspired lofty utterances from those gifted in that way, and a whole tribe of followers has sprung up who vie with each other in attributing to the fair almost revolutionary influences in the arts and sciences. A curious feature about this whole performance is that the most fervid prophecies regarding the influences of certain classes of exhibits are made by people who have no practical knowledge on the subject which they assume to discuss and about which they philosophize in airy abstractions. There is no doubt that in the matter of architecture American taste has been greatly cultivated by the beauty and originality displayed in the exposition buildings and many of the State and foreign buildings. The effect of this may be seen in the future, although it is questionable whether the severe plainness of the large structures now becoming such a conspicuous feature of our leading cities is not much better suited to this utilitarian era than the florid creations of ages long past.

In the matter of exhibits, however, conclusions are not so easily drawn. Never before was such a magnificent array of productions of every character brought together. While in some lines the very best was shown, this was not the case in every line. Many famous manufacturers, whose reputation is world wide, were wholly unrepresented, while their competitors shone in their absence with inferior goods. How, then, in these lines, some of which have been singled out for special praise, could the progress of the art be specifically noted and a pace set for the world to follow hereafter?

It was a great show, and Chicago has won imperishable glory for the grand scale on which it was projected and the triumphant success with which the details were worked out. A great many people were given an opportunity to see more than they could have hoped to see if they were to live to the age of Methuselah with every facility for travel in their power. Perhaps invention has been stimulated and imaginative faculties have thus been quickened in a way that will be felt potently by this nation and the world in the years to come. But the fair nevertheless was a commercial enterprise, expected to be of practical benefit to the locality in which it was held, and all other considerations and influences, charming as they may be, are but secondary and subsidiary. In the light of the heroic struggle forced on the business men of Chicago to make their great enterprise a success, and in view of the narrow escape from serious dangers which might have financially wrecked them, the real lesson of the fair is that other projectors of World's Fairs must not base them on such a prodigious scale. There is but one Chicago.

Destruction of Capital.

An illustration recently presented itself to the writer of the rapid changes possible in the iron trade and the risks unconsciously taken by manufacturers. Four years since there was a mill making a staple article of consumption which was in such strong demand that the supply was by no means equal to the demand. The mill had been running for a year or more and was apparently in one of the best locations, as it was also one of the best equipped and most skillfully managed in the country. Within easy reach were three or four customers whose wants were at times in excess of the output of the mill, so that they were obliged to purchase part of their supplies from distant manufacturers. Other customers in the same line were in prospect, as new enterprises of considerable extent had been undertaken, presumably by men of means. So roseate was the outlook that plans were made for the erection of a duplicate mill and some of the contracts for machinery were placed when a change suddenly came over the scene. One good customer failed and his works were shut down, probably not to resume again. Then another and a larger customer failed, whose works may not be started until there is a decided revival in general business. A third customer dropped out of the race for business

Hosted by Google

to wait for better times. A fourth customer transferred his patronage to another establishment under a more favorable arrangement. The new enterprises were nipped in the bud by the frost which preceded the late cold wave of financial distress and therefore the prospective customers have not developed into actualities. The consequence is that the mill stands and has stood idle for a long time. It is well located, well equipped and ought to be making money for its owners, or at least affording them and their workmen employment. But for the time being it is dead and the capital invested in it is practically lost because it cannot be used when it is most needed. In this case the change was brought about so suddenly that it is hard to realize the cold facts in the case. There are perhaps numerous similar cases that can be cited. The good times all are looking for cannot come too soon.

OBITUARY.

DANIEL L. DAWSON.

A well-known figure in Philadelphia club and literary life passed away on Wednesday, November 1, in the person of Daniel L. Dawson, president of the Gray's Ferry Foundry & Boiler Company, of that city, who died suddenly of hemorrhage of the stomach, age 38 years. Mr. Dawson was born at Lewistown, Pa., and moved to Philadelphia with his father at an early age, the latter becoming engaged in the scrap iron business in the southern part of the city. Young Dawson was educated at La Salle College, and on graduating from that institution assisted his father in business. Later he became associated with his brother in the iron foundry business, under the firm name of John I. Dawson & Bro. After the death of his brother the name was changed to that of the Gray's Ferry Foundry & Boiler Company, Mr. Dawson filling the office of president. He was spoken of as an exceedingly clever business man, but latterly he devoted his time more specially to social and literary pursuits, leaving the management of the company largely to his assistant, Owen I. Roberts. Mr. Dawson was an unconventional man of much force and originality. An accomplished athlete, he was also a poet of no mean reputation, possessing a strange and fervent imagination, which was strongly reflected in his poetry. He was a member of the Manufacturers', Pen and Pencil and Art clubs of Philadelphia, as well as of the Athletic Association of the Schuylkill Navy.

JAMES W. SCOVILLE.

James W. Scoville, a prominent and wealthy citizen of Chicago, died at Pasadena, Cal., on the 2d inst. In his early career he was connected with the Chicago iron trade. He was born in Pompey, Onondaga County, N. Y., October 14, 1825. For a time he worked on the Erie Canal. In 1856 he went to Chicago. He secured the position of cashier for the Eagle Iron Works and subsequently became the assignee of that company. He helped to organize the Eagle Iron Works Company, of which he was treasurer and secretary for a number of years. In 1862 he severed his connection with that company and engaged in the real estate business with J. D. Harvey. In 1869 in connection with T. M. Avery he organized the Prairie State Loan & Trust Company, now the Prarie State National Bank, of which he was president at the time of his death. He was also a director of the Elgin National Watch Company, president of the Chicago Screw Company and of the Cicero Water, Gas & Electric Light Company. As a man he was generous, exceptionally conscientious and scrupulously honest. Six years ago he gave Oak Park, which was then his home, the Scoville Institute, which cost $75,000. He was a lifelong and consistent member of the Congregational Church and had given much money for missions and church improvements.

BENJAMIN S. BROWN.

Announcement is made of the sudden death, October 26, of Benjamin S. Brown, president of the Brown, Hinman & Huntington Company, Columbus, Ohio, and also of Withington & Cooley Mfg. Company, Jackson, Mich.

JULIEN P. CORDIER.

Julien P. Cordier, manager of the Lalance & Grosjean Mfg. Company's Chicago house, died November 2, at his residence, 5943 Wabash avenue, Chicago, in the fifty-first year of his age.

CORRESPONDENCE.

Boiler Awards.

To the Editor: Below we give copy of a special notice in relation to boilers at the World's Fair, Chicago, which we placed on the front of our boilers during the last few weeks of the fair. We would be very much obliged if you would give this notice a place in your reading columns, with such comments as you see fit to make:

SPECIAL NOTICE.

These boilers have received no Award.
Why? Read! Learn!

We were informed that it was the purpose of the Jury to make awards on boilers based entirely upon the written statements of the exhibitors of boilers, without tests or any personal knowledge in the possession of said Jury concerning the comparative construction, operation, economy, or durability of said boilers.

We were asked to make such a statement, and were informed that all other exhibitors of boilers had been requested to make a like statement of their claims for the consideration of the Jury of Awards.

Believing that an award, based on such insufficient knowledge on the part of said Jury, could be of no practical value, and notwithstanding the expense incurred by this company in making an exhibit, we respectfully declined to make any such written statement for the purpose of receiving an award upon our boilers.

While we do not in the least envy those who have, upon such knowledge of the Jury, been awarded premiums, we are equally content to stand upon the record without an award based on such a knowledge of our goods.

Yours very truly,
THE BABCOCK & WILCOX COMPANY,
NAT. W. PRATT.
NEW YORK CITY, November 3, 1893.

The Effect of Cheap Beams.

To the Editor: Referring to Trenton "X.'s" comment on your late article, "The Effect of Cheap Steel Beams," and suggestion "that it would be well to have added that a number of firms were in bankruptcy as a consequence of such cheapness," &c., let us say no tears need be shed while the full, round price per ton of $34.75 is being gotten by the beam maker. This is relatively a "fat" figure to that gotten by the maker of staple lines of iron, wire, nuts, nails, pipe and other kindred productions these many months, and no lamentations were dropped on the public by "X." Where has he been all this time?

Until this nation uses the pounds of iron per capita that the less opulent ones of Europe do, the natural law of humanity will demand widening use. That beams are now offered at less than the ridiculously abnormal price they have been held at for years will contribute to our rapidly assuming a proper place in the iron consumption of the world. It is needless to say this widened use will stimulate demand for all other structural product of the mills. Your article was sound in tenor and exactly in the right direction. XX.

PERSONAL.

John Fritz has resigned his post of consulting engineer of the Bethlehem Iron Company, South Bethlehem, Pa., with which he has been connected for so many years.

F. A. Winchell, for a number of years prominently connected with the Crane Company of Chicago, as auditor, has associated himself with the New York Belting & Packing Company, Limited, 13 Park Row, New York City, as manager of sales department.

A. J. Forbes-Leith of the Illinois Steel Company arrived from Europe last week.

Professor Lunge of Zurich, Switzerland, the authority on chemical manufacture, has sailed for home.

John A. Potter, for some years superintendent of the Homestead Steel Works, Homestead, Pa., but for the past year or so chief mechanical engineer of the Carnegie Steel Company, Limited, Pittsburgh, has resigned his position with that firm, taking effect November 1, and has assumed the position of vice-president and superintendent of the Britton Iron & Steel Company, Cleveland, Ohio.

A dinner to the officers of the Chicago Shipbuilding Company was given at Kinsley's, in that city, on the 2d inst., by the directors of the Lake Michigan & Lake Superior Transportation Company. W. I. Babcock, general manager of the Shipbuilding Company, was presented a silver dinner set by the steamboat people as a token of his "skill and efficiency in the construction of the steamship 'Manitou.'" Among those present at the dinner were: W. L. Brown, Major H. S. Pickands, Walter F. Cobb, C. F. A. Spencer, A. T. Spencer, Joseph Austrian, Capt. Allen McIntyre, S. F. Leopold, Nathan F. Leopold, Alfred F. Leopold, W. I. Babcock, Joseph Berolzheim and Capt. F. D. Herriman.

Electricity as a motive power is being tried on the Erie Canal this week, the Pittsford level, near Rochester, N. Y., being selected for the experiment. The work is being done by the Westinghouse Company of Pittsburgh.

Pig Iron Production Increases.

The tide has turned, there being a tendency to increase the production of pig iron from the lowest notch which it has touched for a good many years. The principal increase has taken place in the Central West, where the resumption of so many steel works and rolling mills has induced their owners to resume work at the blast furnaces which form a part of the plant. Since November 1, on which our report is dated, there have been further additions, and it is known that others will follow before the end of the month. Thus far this movement is practically confined to the Pittsburgh and its tributary districts, the Mahoning and Shenango valleys and the Wheeling section. In the East and South there has also been a movement, less pronounced, toward a heavier production, but the Northwest still lags.

Illinois, Missouri, Wisconsin, Minnesota and Indiana still fail to record a single coke furnace running. The starting of the steel works may, however, soon bring a change.

On November 1 the active furnace plant, grouped according to fuel used, possessed the following weekly capacity:

Fuel.		
Anthracite	34	16,166
Coke	57	58,820
Charcoal	26	5,084
Total, November 1	117	80,070
Total October 1	114	73,895
Increase	+ 3	+ 6,175

The weekly product of all the furnaces on November 1 compared as follows with that of preceding periods:

	Furnaces in blast.	Capacity per week. Gross tons.
November 1, 1893	117	80,070
October 1	114	73,895
September 1	125	83,434
August 1	169	107,042
July 1	220	153,742
June 1	244	174,029
May 1	251	181,551
April 1	255	178,858
March 1	255	176,978
February 1	251	171,201
January 1	246	173,068
December 1, 1892	246	176,271
November 1	244	171,082
October 1	236	158,027
September 1	236	151,648
August 1	238	155,136
July 1	254	169,151
June 1	269	173,674
May 1	268	177,886
April 1	280	185,462
March 1	305	193,902
February 1	308	187,383
January 1	305	188,082
December 1, 1891	298	188,135

The status of the anthracite furnaces was as follows:

Anthracite Furnaces, November 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York	18	2	1,134	16	5,519
New Jersey	11	3	1,656	8	3,150
Spiegel	3	2	149	1	118
Pennsylvania:					
Lehigh Valley	44	11	3,986	33	12,536
Spiegel	1	0	0	1	61
Schuylkill Valley	27	9	4,832	18	7,910
U. Susquehanna Valley	14	2	915	12	4,275
L. Susquehanna Valley	17	2	1,668	15	5,490
Lebanon Valley	15	3	1,826	12	5,470
Totals	150	34	16,166	116	44,529

For a number of months past our records of active anthracite furnaces show the following:

	Furnaces in blast.	Capacity per week.
November 1, 1893	34	16,166
October 1	34	15,338
September 1	43	20,758
August 1	51	23,572
July 1	63	29,268
June 1	70	33,916
May 1	67	33,168
April 1	72	34,641
March 1	74	34,773
February 1	74	32,871
January 1	70	32,772
December 1, 1892	69	33,602
November 1	69	30,869
October 1	69	29,958
September 1	66	27,453
August 1	66	28,821
July 1	72	31,754
June 1	76	33,209
May 1	81	35,473
April 1	84	36,487
March 1	89	38,678
February 1	93	38,124
January 1	94	38,307
December 1, 1891	85	34,905

Burden blew in on the 26th ult. and Andover in New Jersey also started one stack. One Swede in the Schuylkill Valley stopped.

The status of the coke furnaces was as follows on the 1st inst.:

Coke Furnaces, November 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York	7	0	0	7	5,247

Georgia	2	1	645	1	600
N. Carolina	1	0	0	1	97
Totals	260	57	58,820	203	142,394

As compared with previous months, the active coke furnaces make the following showing:

	Furnaces in blast.	Capacity per week.
November 1, 1893	57	58,820
October 1	52	53,061
September 1	54	56,976
August 1	84	77,907
July 1	122	117,072
June 1	140	132,079
May 1	146	139,788
April 1	145	135,488
March 1	145	133,579
February 1	140	129,396
January 1	138	131,731
December 1, 1892	136	133,160
November 1	133	130,673
October 1	128	118,895
September 1	128	114,538
August 1	131	117,984
July 1	140	127,433
June 1	145	128,852
May 1	147	132,313
April 1	152	138,116
March 1	163	143,490
February 1	167	138,268
January 1	163	138,611
December 1, 1891	162	142,747

During October, Clinton in the Pittsburgh district was banked, but two Edgar Thomson and one Monongahela furnaces were started. In the Mahoning Valley Grace and Hazelton were no producing on the 1st inst., but Hubbard and Mary are active.

In the South, the Woodward in Alabama, Citico in Tennessee and Ivanhoe in Virginia blew in during October. Big Stone Gap, however, stopped work.

The condition of the charcoal furnaces was as follows:

Charcoal Furnaces, November 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New England	13	5	390	8	570
New York	5	0	0	5	585
Pennsylvania	13	2	154	11	761
Maryland	6	2	125	4	300
Virginia	13	0	0	13	827
Ohio	9	4	317	5	263
Kentucky	3	1	81	2	200
Tennessee	8	2	660	6	396
Georgia	3	1	254	2	230
Alabama	13	3	651	10	2,540
Michigan	20	3	1,140	17	5,111
Missouri	2	1	340	1	293
Wisconsin	4	1	747	3	1,127
Texas	4	0	0	4	603
Washington	1	0	0	1	100
Oregon	1	1	225	0	0
Totals	118	26	5,084	92	13,906

As compared with previous months, the record of active charcoal furnaces stands as follows:

	Furnaces in blast.	Capacity per week.
November 1, 1893	26	5,084
October 1	28	5,496
September 1	28	5,700
August 1	34	5,563
July 1	35	7,224
June 1	34	8,034
May 1	38	8,595
April 1	38	8,729
March 1	36	8,623
February 1	37	8,934
January 1	38	8,865
December 1, 1892	41	9,509
November 1	42	9,540
October 1	39	9,174
September 1	42	9,657
August 1	41	8,331
July 1	42	9,964
June 1	48	11,613
May 1	44	10,100
April 1	44	10,859
March 1	50	11,734
February 1	49	10,991
January 1	48	11,164
December 1, 1891	52	11,033

During October Shelby in Alabama and Olive in Ohio went out. Muirkirk in Maryland stopped on the 2d inst., while Union in Michigan blew in on the 3d inst. to work up the existing stock of ore and charcoal.

Stocks.

The position of stocks, sold and unsold, as reported to us November 1, was as follows, the same furnaces being represented as in former months:

Stocks:	Aug. 1. Tons.	Sept. 1. Tons.	Oct. 1. Tons.	Nov 1. Tons.
Anthracite pig	111,468	115,930	121,597	134,157
Coke pig	420,390	513,260	532,157	503,806
Charcoal pig	191,838	197,881	199,008	200,450
Totals	723,696	827,071	852,762	838,413

The prolonged suspension of operations on the part of a large number of coke producers is beginning to have its effect upon the stocks of coke pig iron carried, but returns show that during October a decrease of 28,351 tons took place, bringing the figure down to 503,806 tons, as compared with 532,157 tons on October 1. Mahoning Valley reports a decrease of 9500 tons and New York State and the Shenango Valley 5000 tons each. Alabama, Virginia and Kentucky also report a falling off. The anthracite furnaces have increased their holdings by 12,560 tons, while the charcoal producers have added 1442 tons to their stocks.

The Foundrymen's Association.

The annual meeting of the Foundrymen's Association was held at the Manufacturers' Club, Philadelphia, on Wednesday, November 1, with a large attendance of members. The president, Francis Schumann, occupied the chair. The secretary, Howard Evans, announced the death of Daniel L. Dawson of the Gray's Ferry Foundry & Boiler Company, Limited, Philadelphia, a member of the association well known among the iron trade and in literary circles. The treasurer, Josiah Thompson, presented his report for the past six months, showing that his total receipts had been $848.89 and his payments $609.98, leaving a balance in hand of $238.91. On motion the report was filed and ordered to be spread upon the minutes.

Geo. P. Smyser of E. G. Smyser's Sons, York, Pa., representing the structural iron work section of the Price Committee, reported that his section had had one meeting and another had been called, but fell through, owing to nonattendance of members. It was arranged to hold another meeting next week, and he could say for his section that it was getting along very nicely. R. A. Register of Register & Sons, Baltimore, Md., representing the cast iron soil pipe section of the committee, reported progress.

P. D. Wanner of the Mellert Foundry & Machine Company, Reading, Pa., for the cast iron pipe section of the committee, reported that there had been no regular price for cast iron pipe during the last month or so. He said they were now reaching the end of the season and cast iron pipe was, as a rule, lower at this time than during the summer or fall. It had lately been sold and offered for delivery in the interior of the State of Pennsylvania at prices less than 1 cent per pound, prices at which it could not at the present time be made. In other words, he said, it was being sold at prices very considerably below cost. In his opinion this proceeding was wrong. He believed he knew something about pipe making and was in a position to know that it was being sold below cost. Whether it was done to keep shops going or to relieve financial difficulties, he could not say, but believed it to be a wrong course in either case. When manufacturers turned out goods for sale at prices below cost and failed, they had been drawing on the people to whom they were indebted, which in his opinion was wrong and simply constituted robbery. If the association was to do good to its members and good for the community, it appeared to him advisable in matters of this kind to talk plainly.

The president then delivered the following address:

"To-day is the third anniversary of our association. I avail myself of this occasion to briefly address you upon our condition, and to state my views as to our future conduct and policy.

"During the past year we have continued to grow steadily, both in membership and stability. We are gradually uniting the foundrymen throughout the country for their common interests. We have set the example for the creation of similar associations in other and distant sections of the country, and our members are experiencing the beneficial effects of the unity of action due to organization, and thus the first and most important result has been attained.

"We have, during the year, informally discussed the desirability of combining all similar associations that may exist or be formed throughout the country under one parent head, to and from which all matters affecting our welfare radiate. That such an organization, national in character, would be of vital importance none of us will deny, and it remains but to determine the details and methods to effect this.

"I would suggest that, after we have passed through the present depressed state of business, a call be issued by this association for a congress of the different organizations, as well as to foundrymen in general, to meet at some central point for the purpose of forming a national organization, of which the local associations shall form chapters or subordinate branches. The local associations to be independent of each other, but acting in unity with and through the parent association, from which all principal matters shall emanate. The parent body to be composed of representatives from the various chapters, to be elected by the respective chapters annually. Each chapter to be entitled to one representative for any fraction of each one hundred *bona fide* members. These representatives to elect a president, vice-president, secretary and treasurer at an annual convention held at different points from year to year. These officers, beside five members elected at these meetings, to constitute an Executive Committee, who shall meet monthly and act upon all matters affecting the interests of the association. The expenses of the parent body to be borne by the chapter, *pro rata*, according to the number of representatives. I advance the foregoing as mere suggestions, with the hope that the importance of the subject will be appreciated and fully discussed.

"It has occurred to me that, possibly, among the causes for the excessive competition in our business is the variable judgment applied in classifying work and the liberty so often permitted unscrupulous parties to vary from the specifications, always to the disadvantage of *bona fide* bidders and tending to inferior work. Especially is this the case with municipal work, the quality and rates paid being really deplorable. We as an association should insist on a rigid inspection, which, if properly applied, would soon correct the evil.

"The benefits to us from such inspection are readily understood when we turn to Government work, as an example, which is now carefully inspected and commands much better prices, no one now being so bold as to cut prices on the assumption that he could cut the quality of the work accordingly.

"Proportionately with the growth of the country less castings are used to-day than formerly. Especially is this so with structural work. Hardly any castings are now used in bridges; wrought iron columns are gradually superseding cast; rolled beams have almost entirely taken the place of cast iron girders and lintels, and even stairs are now largely made of wrought iron and slate or marble. Even cast pipe is meeting with competition from wrought or rolled pipe. These gradual changes are felt and must be met.

"The present severe business depression is keenly felt in our and kindred industries, and unfortunately intensifies the evil of unhealthy competition in the anxiety to obtain work at any price, thus seriously interfering with the plans of our association and tending to nullify our acts.

"If the values in our country are undergoing a readjustment, which I much fear, we will be compelled to adjust the prices paid and received by us to suit the new order of things. Even now, taking our industry as a whole, it is not profitable, taking into consideration the close application, special knowledge required and risks connected therewith as compared to other industries. The question of what we pay and what we receive for our product is one that must receive the consideration of foundrymen in the near future, and one that should be discussed in a convention as I have suggested.

"I would also repeat my suggestion of the importance of the organization under each association of the different branches of our industry, such as pipe makers, structural work, machine castings, malleable castings, &c. While this division has been discussed no decisive action has been taken.

"We must employ all means possible to make our monthly meetings interesting, and I desire to impress upon the Executive Committee the importance of proceeding as they so well began in this direction — the discussion of subjects of general interest, which, besides papers obtained from qualified persons upon subjects bearing on our industry, either directly or indirectly, could be published annually for our use.

"The beneficial effects resulting from this association have been felt by many of us, and not one will deny its value, but, on the contrary, will help to maintain it in the future, especially through these trying times, which will pass away as sure as sunshine follows storm; so will we emerge from the difficulties now before us, and do our share toward the development of our great country, bearing in mind that the healthy growth of our industry, as well as that of our country, depends on united and comprehensive action based on patriotism, good will and good faith between us."

Election of officers for the ensuing year being next in order, and the by-laws of the asssociation requiring nomination at one meeting and election at a subsequent meeting, it was on motion resolved that the by-laws be suspended on this occasion, and that the nomination and election of officers be proceeded with.

Justice Cox, Jr., nominated for re-election the present officers and Board of Directors of the association. These gentlemen, he said, had filled their positions with such credit, not only to the association but to themselves, that it would be hardly fair at this time to think of putting others in their places. He considered that the work they had done had been done so well and so cheerfully that it would not be courteous to think of electing others in their places. He felt sure that the members would share his views in the matter. This nomination being seconded and nominations closed, the following gentlemen were re-elected: President, Francis Schumann of the Tacony Iron & Metal Company, Philadelphia; vice-president, Thos. Devlin of Thos. Devlin & Co., Philadelphia; treasurer, Josiah Thompson of I. S. Cassin & Co., Philadelphia; secretary, Howard Evans of J. W. Paxson & Co., Philadelphia.

Executive Committee: Walter Wood of R. D. Wood & Co., Philadelphia; Thos. Glover of Glover Bros., Frankford, Philadelphia; L. B. Whitney of A. Whitney & Sons, Philadelphia; H. C. Vansant of Morris Tasker & Co., Incorporated, Philadelphia, and Stanley G. Flagg, Jr., of Stanley G. Flagg & Co., Philadelphia.

Under the head of unfinished business the subject of obtaining chemical determinations at low rates was again

Hosted by Google

taken up. The secretary stated that he would like to know from foundrymen individually the number, as nearly as possible, of determinations they would be likely to require in the course of a year, with the idea of getting a basis for a price. He said that there were one or two institutions willing to equip for the purpose of making determinations for the association. An arrangement of this kind, he thought, would serve to make a membership in the association valuable, and present opportunities for procuring determinations at very much lower prices than those generally ruling. Of course, he said, such an arrangement would not be acceptable to those having chemists in their employ, but to an ordinary foundryman who might wish to know the character of the iron he was using or the castings he was making a few determinations would be valuable, and it was for members of this class that facilities for determinations were sought. In the regular invitations to this meeting the question "How many determinations would you require?" was asked, but only a few had responded. He read a few of the replies he had received. One from a firm in Cleveland, Ohio, expressed doubt as to the proposed arrangement proving to the advantage of members at a distance. In regard to this the secretary explained that the only delay to members at a distance would be the time occupied in the transmission of samples and instructions by mail, and that as far as Cleveland was concerned, any matter mailed in that city before 6 p.m. would reach Philadelphia the next day. Very little delay, therefore, would result in the case of determinations required by distant members.

A lengthy discussion then took place on the practicability and advisability of making arrangements for chemical determinations. The president suggested that furnacemen send out with their iron a statement or schedule of the elements contained in such iron, free carbon, combined carbon, sulphur, phosphorus, manganese, &c., and in a column set apart for the purpose state which of such elements would induce hardness, softness, fluidity, strength, chilling, density, shrinkage and so on. A foundryman would in this way get to know what to look for in his irons. When, in purchasing iron, a furnaceman claimed that his iron contained certain percentages of silicon or manganese, the foundryman could say at once that it would not do, as he was making tough castings and wanted a very fluid iron. In this way the foundryman would get an idea as to the elements he should have in his iron.

Justice Cox, Jr., thought a statement such as suggested could be given by furnacemen and it would naturally educate the foundryman in chemistry. It would tell him what elements would be required to get fluid iron, shrinkage and other effects. The furnaceman, he said, had got to that at the present day through his chemist, and could say that he made iron by rule and knew that if he used certain kinds of ore, limestone and fuel a certain iron would result. If furnacemen, he said, would get up a card or statement it would be a good thing.

J. Birkinbine remarked at length upon the subject. In his opinion the foundryman should establ sh a standard in order that the pig iron men might produce the iron he required. In regard to chemical anyalyses he thought the association was pursuing a wrong course in seeking to get their determinations through educational institutions. He explained the necessity of having analyses of an exact character, and pointed out that the professional chemist could make determinations quicker and at much less expense than could students, owing to his familiarity with his work and his knowledge of short cuts, only known to experts, for quickly determining the existence and quantities of certain elements. He did not wish to be understood as disparaging the capabilities of the University of Pennsylvania and the Drexel Institute for making determinations, but was sure that men who made such work a specialty would make analyses the cheapest. He had occasion, he said, some time ago to have some 400 analyses made, but when he started he thought 100 would answer his purpose. He made an arrangement with a Philadelphia testing laboratory practically on the basis of quantity reductions; for instance, if given a certain amount of work, a certain reduction was to be made, and if further work, a further reduction. He believed it would be practicable for this association to make an arrangement with a reliable man in Philadelphia. They could propose to him that he be appointed the chemist of the association, to do their work, and that he give them his regular terms, so that he would not be doing an injustice to other patrons. He could then be asked what discount he would allow for a certain amount of work per month, and thus get terms based on the amount of work per month given to him. In this way, he thought, a satisfactory arrangement could be made if all in the association would agree to use that chemist. Mr. Cox thought Mr. Birkinbine's suggestion a good one. He believed such an arrangement could be effected, and it would not be necessary to guarantee any amount of work to the chemist. It was simply necessary, he said, to make an arrangement for one chemist to do the work of the association, and if he made one analysis it would be so much, if two so much less, and so on from month to month. In some months the number of analyses would be greater than in others.

Mr. Riehlé then made a motion that the secretary put himself in communication with some of the best known chemists in the city, with the view of getting their rates for analyses in quantities, the quantity made in one year to determine the price.

Mr. Flagg seconded the motion, which, on being put to the meeting, was carried unanimously.

The meeting then adjourned to the roof garden of the club, where a supper was served and an hour or two pleasantly passed.

Secretary Herbert has selected a special board to inquire into the best and most economical method of correcting the defects reported to be existing in some of the vessels of the new navy. The duty of the board will be to determine which should be adopted of the several plans submitted to the Navy Department for the redistribution or reduction of weights, &c., so as to correct the top heaviness discovered in the vessels. The ships included in the list to be investigated are the "Detroit," "Montgomery," "Machias," "Marblehead," "Castine," "Cincinnati," and "Raleigh," but it is possible that the work of the board may be extended so as to include all the vessels now under construction.

MANUFACTURING.

Iron and Steel.

The executive officers of the Carnegie Steel Company, Limited, at Pittsburgh, have been at work for some time preparing a wage scale to govern wages to be paid at the Homestead Steel Works, Homestead, Pa., after January 1, 1894. An official of the concern is on record as saying that the terms of the new wage scale will be kept secret, as the firm do not propose to furnish information to other manufacturers regarding wages paid at any of their plants.

It is stated that at a recent meeting of the directors of the Cambria Iron Company, Johnstown, Pa., held in Philadelphia, steps were taken looking to a large increase in the capital stock of the concern. It is also stated that improvements are contemplated which will result in the expenditure of a large amount of money.

The Reading Rolling Mill Company, Reading, Pa., have notified their employees that, in order to keep the plant running, it will be necessary to make a reduction of 10 per cent. in wages, and also to reduce the puddlers to $3 a ton.

Recently suit was entered by the Pittsburgh Iron & Steel Engineering Company, engineers and contractors, Pittsburgh, against the West Superior Iron & Steel Company, West Superior, Wis., to recover $61,615, which is the balance claimed to be due on an account amounting originally to $349,600. It will be remembered that the first named concern erected the Bessemer steel plant of the West Superior Iron & Steel Company, and the contract price has been paid with the exception of the amount for the recovery of which suit has been entered. The concern made an assignment several months ago and their plant has since been closed down. It is expected that the trial of this suit will bring up some very interesting legal points, as the New York Central Trust Company, who negotiated bonds for the West Superior Iron & Steel Company, will contest the suit. It is stated that the firm were organized in Minnesota and the bondholders are responsible for their debts even after the assignment had been made.

It is stated that the Indiana Iron Company, Muncie, Ind., have made a proposition to their employees to pay wages based upon the Amalgamated Association scale, but have refused to sign the scale. As yet the men have not accepted this proposition, and the plant is still idle.

Douglass Furnace, at Sharpsville, Pa., formerly operated by the Douglass Furnace Company, has been lighted up under the management of Corrigan, Ives & Co., Cleveland, Ohio.

Stewart Furnace of the Stewart Iron Company, Limited, at Sharon, Pa., has been started up after being banked ten weeks. The rolling mill of this firm continues idle, with no prospects of immediate resumption.

R. C. Neal has been appointed receiver of the Harrisburg Rolling Mill Company, Harrisburg, Pa., which corporation was affected by the embarrassment of the Tube & Iron Company at Middletown. It is understood that this is a move toward resumption. About half the employees were ordered to report for work. The mills have been shut down three months.

A dispatch from Steubenville, Ohio, says that the Mingo Steel Works, after a two weeks' shut down, have resumed.

One of the pipe foundries of the Mellert Foundry Company of Reading, Pa., has shut down indefinitely.

Furnaces Nos. 2 and 3 of the open hearth mill and the Krupp washer department, at the Cambria Iron Works, Johnstown, Pa., have resumed work.

As showing the falling off in the product of some mills during the past two or three months, compared with the same periods of last year, we cite the case of the Akron Iron Company of Akron, Ohio. In October of last year this firm turned out 2000 tons of finished product, while in the same month of this year their output amounted to only 178 tons. This concern signed the Amalgamated Association scale in July, so that it could run without interruption. However, the falling off in orders was so great that

Hosted by Google

their plant has not been operated to anything like its full capacity for the past three or four months.

At the request of the bondholders, the sale of the property of the Brady's Bend Iron Company, at Kittanning, Pa., which was to have taken place last week, has been postponed to December 1.

The new corporation formed to take over the rolling mill of the Chicago Steel Works, at Chicago Heights, Ill., will be named the Inland Steel Company and incorporated under the laws of Illinois, with a capital stock of $130,000. Steps are now being taken to complete the organization and get the affairs of the concern in proper shape.

It has been stated by the Girard Iron Company, Girard, Ohio, that the Biwabik ore, which has been used in the blast furnace of that concern for some time, required for its reduction 15 per cent. less coke than the mixture previously used.

Furnace No. 2 of the Carrie Furnace Company of Pittsburgh, which has been idle for some months, will probably resume blast during this month.

Advices from Columbus, Ohio, state that the Farmers' Loan & Trust Company of New York City have asked that a receiver be appointed for the Consolidated Wellston Coal & Iron Company of Ohio, who, as alleged, have defaulted in the interest on $5,000,000 worth of bonds since April 1, 1888. The property was transferred by the company to Francis Hinckley of Chicago, who promised to pay the interest on the bonds and take care of the principal, but it is claimed has not done so.

Sharon Furnace of the Sharon Iron Company, Limited, at Sharon, Pa., which has been idle for some months, resumed blast on Wednesday, the 1st inst.

The plant of the Johnson Company, Johnstown, Pa., manufacturers of street railway supplies, which has been in only partial operation for some months past, has resumed operation to nearly full capacity in all departments.

We are advised that the statement that the Penn Nail Company, Limited, Lancaster, Pa., had decided to close down their entire plant on account of lack of orders is without foundation. This concern are operating their plant entirely upon orders, and while these are not sufficient to warrant full operations in all departments the concern have no intention whatever of closing down, as they expect to be able to operate their plant right along, though not to full capacity.

The Irondale Rolling Mills, at Anderson, Ind., have been destroyed by fire at a loss of $40,000.

The Brilliant Iron & Steel Company, Brilliant, Ohio, have signed the Amalgamated Association sheet iron scale, and notified their employees, about 600 in number, to report for work at once. The plant has been idle for over four months.

The Syracuse Steel Wire Company have been incorporated under the laws of New York State, to manufacture steel wire in Syracuse. The company have a capital of $20,000.

The Fort Payne, Ala., furnace has been sold at public auction to N. W. Trimble for $30,000. It is understood that the purchaser represented the bondholders.

The plant of the Hollidaysburg Iron & Nail Company, at Hollidaysburg, Pa., has resumed operations.

A Toronto, Ont., newspaper states that James Worthington, president of the Ontario Bolt Works Company, is reported to be negotiating for the purchase of the Ontario Rolling Mills, at Swansea. It is understood that $100,000 is the price asked.

The Hercules Iron Works, at Aurora, Ill., have resumed work with a small force. A number of orders are on hand, and employment will be given to a large number of additional hands at once.

The puddling mill of the Pennsylvania Bolt & Nut Works, at Lebanon, Pa., has closed down for an idefinite period. When operations are resumed it is stated that a lower scale of wages will go into effect.

It is stated that the Parkesburg Iron Company, at Parkesburg, Pa., have announced a general reduction of 20 per cent. in wages.

A number of additional departments of the plant of the Cambria Iron Company, at Johnstown, Pa., which have been idle for several months past, were put in operation on Monday morning, the 6th inst. The starting up of these departments will give employment to some 200 additional men.

Announcement is made that the entire plant of the Pennsylvania Steel Company, at Steelton, Pa., will be put in full operation during this week, with good prospects of full capacity being employed right along.

The puddling department of the plant of the Brilliant Steel & Iron Company, at Brilliant, Ohio, was put in operation on Monday, the 6th inst., on a contract for 1000 tons of muck bar. As yet it is uncertain when the finishing department of this plant will be started up.

Machinery.

A paragraph printed in the first column of *The Iron Age*, page 744, issue for October 26, 1893, erroneously stated that the patterns for deep well pumps formerly manufactured by the Bradford Well & Pump Company of Cincinnati, Ohio, had been purchased by other parties, together with sundry other apparatus, &c. The patterns in question are still in the possession of the Bradford Well Supply Company, who made the purchase from the late firm of Bradford Well & Pump Company at a recent sale.

The P. H. & F. M. Roots Company of Connersville, Ind., who have been makers of rotary blowers for 33 years, have recently established a branch office in Chicago at 501 Manhattan Building.

The plant of the Westinghouse Air Brake Company of Wilmerding, Pa., which has been entirely closed down for about a month, resumed operations on Monday, the 6th inst. The works will be operated four days per week of seven hours each.

The Rice & Whitacre Mfg. Company's stock, machinery, tools, fixtures, patents, &c., are offered for sale by the receiver, F. B. Dyche, at 43 to 47 South Canal street, Chicago. Bids will be received up to 12 o'clock, noon, on the 20th inst.

Kenneth Torrance, M. E., has established an office in Room 1437 Monadnock Block, Chicago, for the sale of the Cochrane heater and separator, made by the Harrison Safety Boiler Works of Philadelphia, and also the Duval metallic packing and the specialties manufactured by the Hendrick Mfg. Company of Carbondale, Pa. Mr. Torrance was formerly connected with the Chicago office of Henry R. Worthington, has had experience of a practical character in varied technical work and offers his services as consulting mechanical engineer.

The Buckeye Engine Company, Salem, Ohio, recently made a sale through their agents, Bagnell & Hillis, Yokohama, Japan, to the Electric Light Company of Manila, Philippine Islands, of six compound engines, each having a rated 200 horse-power capacity, the cylinders being 13 and 22½ inches diameter by 18-inch stroke. Four of these engines have already been shipped to the above place and the final shipment of the other two will be made during this month. The plant is quite a large one, and on account of its size and location competition among engine makers for this order was very severe. It is understood that the Brush electrical machinery will be used in connection with the engines, and the lighes are to be both arc and incandescent, the intention of the firm being to furnish street as well as commercial lighting. The Buckeye Engine Company have already supplied quite a number of electrical plants in Western Asia with power, and naturally view with considerable satisfaction their growing trade in that direction.

Wm. Tod & Co., founders and machinists, Youngstown, Ohio, are operating their several departments, though not to full capacity. The firm have quite a number of small orders on hand and expect to be able to maintain their present active capacity throughout the winter.

At the plant of the Erie City Iron Works, Erie, Pa., manufacturers of boiler and other machinery, additional departments have recently been started up, and the outlook for future operations is considerably brighter than for some time past. This concern are now giving employment to about 450 men, their plant being in operation six days per week of eight hours each.

The Leechburg Foundry & Machine Company of Pittsburgh recently shipped a Mesta patent automatic pickling machine to the Whitaker Iron Works, Wheeling, W. Va., and a 36-inch trimming shear to Marshall Brothers & Co., Philadelphia.

In January last the Atlantic Works and the Robinson Boiler Works of Boston, Mass., were consolidated, and work begun on a new building for the manufacture of boilers. This building has just been completed. It is constructed of brick and iron, and is 100 feet wide by 225 feet long, with a riveting tower 28 x 38 feet, making the total floor area 25,500 square feet. The additions and changes made to the plant represent an outlay, it is stated, of about $200,000.

The creditors of the Carthage, Mo., Foundry, have decided to ask for the appointment of a receiver to wind up their affairs.

The New York Engineers' Supply Company have been incorporoted at Albany, N. Y., for the purpose of manufacturing and selling boilers, engines, pumps and machines.

The foundry and machine shops of E. C. Wehrifritz, at Little Rock, Ark., have been destroyed by fire, supposed to have been of incendiary origin. Loss, $40,000; insurance, $6200.

The molders and polishers of the National Brass & Iron Works, at Reading, Pa., have been placed on piece work on a scale equal to a 10 per cent. reduction.

Wells & Coutan Company, Limited, 29-31 Gold street, New York, are directing the attention of the trade to the fact that their business is of a threefold character—viz., manufacturing high grade steam gauges, which is done on the premises; exclusive importation of the Thistle gauge glass and the representation of J. E. Lonergan & Co. for the sale of their pot safety, water relief and snifter valves.

Hardware.

Cowles Mfg. Company, Kansas City, Mo., a concern recently organized, are building a factory for the manufacture of a mechanical device for feeding threshing machines. This machine is designed to cut the bands and separate the grain in the bundle, giving a regular feed to the thresher. About 15 men will be employed when the factory is completed.

The works of the Birmingham Hardware Specialty Company, East Birmingham, Ala., have resumed operations, giving employment to about 30 men.

The Glade Axe & Tool Works, Warren, Pa., which have been in operation since June, are about to be reorganized into a stock company for the purpose of enlarging the plant. The works have employed 25 skilled workmen, and the extension of plant will increase the force to 50.

The W. D. Gibson Company, Chicago, Ill., manufacturers of crucible spiral springs, advise us that their business is rapidly picking up. The company have received World's Fair award for their exhibit of springs for all purposes.

The factory of Newhall & Stebbins, Hinsdale, N. H., has started up with somewhat less than their usual force.

A. D. Goodell of Worcester, Mass., contemplates engaging in the manufacture of mechanics' tools and several specialties at Shelburne Falls.

The Automatic Clothes Line Company, Austin, Texas, have been incorporated. The capital stock is $30,000. The incorporators are Fred. Sterzing, John W. Kelly and Ed. G. Lane, all of Austin.

The Dunham Nut Company, Unionville, Conn., have commenced to fit up their new factory and expect soon to move in machinery.

The National Wheel Company, Jackson, Mich, have resumed operations.

The Burton Magazine Gun Company have been incorporated to manufacture magazine guns in New York City. The capital is $10,000, and the directors of the company are Eugene Durnin, Peter A. Hendrick and Benjamin Yates, all of New York.

The Consolidated Lamp & Glass Company is the title of a corporation which has just been chartered under the laws of West Virginia, and which will have headquarters in Pittsburgh. The paid up capital stock is given as $200,000, with the privilege of increasing it to $250,000. The following officers have been elected: F. G. Wallace, president; J. B. Graham, secretary; Jos. G. Walter, treasurer, and N. Kopp, manager. The new concern expect to have their goods on the market not later than January 1 next. Negotiations are now in progress looking to the purchase of a large plant, to which additions and alterations will be made. The principal warehouse will be located in Pittsburgh, and the general offices will also be in that city. It is the intention of the new concern to not only manufacture the glass and porcelain

Hosted by Google

portions of lamps, but also all the other parts, including the brasses.

Humason & Beckley Mfg. Company's cutlery factory at New Britain, Conn., is now running three days a week with a full force.

The bolt works of Clark Bros. & Co., Milldale, near Southington, Conn., were burned on Friday last. The office and packing room, which were in a separate building, were saved. The fire started in the forging room, and as the works were beyond the water works' line, the firemen could do nothing but save adjoining buildings.

Miscellaneous.

Randolph & Clowes of Waterbury, Conn., are making considerable improvements in their plant in many directions. They have recently established a department for the manufacture of plumbers' materials and supplies. They are using for this purpose a portion of the buildings which have remained unused heretofore since the time of Brown & Bros. This department has only been started this year. They have facilities for the turning out of new patterns and designs for such things as lavatory legs and brackets. Their operations in this direction are facilitated by their having in their mill departments which furnish brazed tubing of the newest designs and moldings. They have recently taken out a patent in connection with this department for a plumbers' ferrule, of which, although on the market for a very short space of time, they are already making large sales.

The Scovill Mfg. Company of Waterbury, Conn., manufacturers of brass, German silver and aluminum, have issued a short catalogue referring to their aluminum fancy goods, including watch safes, vases, paper knives, smokers' sets, cigar cases, shaving cups, mirrors, easels, puff boxes, trays, picture frames and napkin rings.

The Pittsburgh Reduction Company of Pittsburgh, manufacturers of pure aluminum, have awarded a contract for the buildings for the new plant which this concern propose to erect at Niagara Falls. Jas. Stewart & Co. of Niagara Falls were awarded the masonry contract, while the structural iron work will be done by Debbie & Stewart of the same place.

Among recently authorized corporations in Illinois are the following: United States Vise & Pipe Wrench Company, Chicago; capital stock, $25,000; incorporators, Charles A. Petterson, Andrew Hallner, Class Roberg and Adolf F. Bergborn. Fowler Foundry Company, Chicago; capital stock, $50,000; incorporators, H. R. Pebbles, Colin C. H. Fyffe and Howard D. Headley. A. Boyce Foundry & Machine Works, Bunker Hill; capital stock, $25,000; incorporators, Arthur Boyce, John R. Richards and George T. Dright.

The Mount Clare repair shops of the Baltimore & Ohio Railroad, at Mount Clare, Md., have closed down. It is understood that this action precedes a general reorganization and concentration of the road's extensive repair system.

It is announced that the Lebanon Chain Works, at Lebanon, Pa., have received the contract from the United States Government to manufacture chains for light vessels, the amount of the contract being $10,000.

The citizens of Memphis, Tenn., are displaying great enthusiasm and holding mass meetings because a local land syndicate has persuaded the Litchfield Car & Machine Company of Litchfield, Ill., to remove their plant to Memphis. The "persuasion" used was in the form of a liberal donation of land and a bonus of $125,000 cash, and other minor considerations. Whether the enterprise will prove "the dawn of a new era" for Memphis or only the usual land boom scheme remains to be seen.

The New York bonded warehouses, which have been for months full to overflowing with foreign goods, whose owners were either unable to pay the duty or were awaiting the Senate's action on the Repeal bill, are beginning to feel a relief from their congestion.

The rush of foreigners to visit the World's Fair did not assume anything like the proportions expected. Steamship agents in New York estimate that not more than 25,000 World's Fair visitors passed through this port during the time the exposition was open.

TRADE REPORT

The event of the week has been the confirmation through actual sales of reports current for some time past that a heavy cut in prices has been made in Steel Rails. The war of the giants is now begun, the initiative having been taken by the Pittsburgh concern, which has been trying to capture trade in Eastern territory. It is fair to quote $24 @ $25 at tidewater now, a clean cut of $5 ℔ ton under the price which has nominally ruled so long. It has been an open secret that by a variety of devices the $29 rate had been shaded for a long time.

It should be stated that the price was never at any time during the life of the association a part of the signed agreement under which it was working, although an informal understanding did exist at times. It is true also that the association is intact to-day, and will remain so until the expiration of the present contract. Whether the latter will be renewed is doubtful, since the Pittsburgh interest has declined advances in that direction. Those interested in the market should consider that there is always the contingency of a renewal of it, as the result of an exhausting fight.

It may be frankly acknowledged that in the Iron trade generally the Rail Association has always been a pretty unpopular organization. Its existence has been embarrassing in more ways than one. The Soft Steel makers have suffered from the competition of some of the Rail mills who have taken Billet business at low prices to keep going during times of idleness in the Rail trade.

The effect of the break in Rails is expected to be favorable to other branches. It is sure to lead to the placing of a far more liberal volume of orders for Rails which will first clean up the accumulated supplies of Pig Iron at the Rail mills, and then will create a larger demand for Ore and Coke. It seems probable that the outcome will therefore be a strengthening of the markets of raw material as the first step toward a return to living rates for Iron and Steel.

The production of Pig Iron is on the increase again, the additions to the capacity at work in the Pittsburgh, Shenango, Wheeling and Mahoning districts being in response to a larger volume of business of the rolling mills and Steel works.

In the West, and to a limited extent in the East, the volume of orders is larger, but as yet the lowest prices reached are still the basis of business. Whether the Western mills will ease their pressure upon the Eastern markets soon remains to be seen. Until now they have not done so.

Chicago.

(By Telegraph.)

Office of *The Iron Age*, 59 Dearborn street. CHICAGO, November 8, 1893.

The volume of business continues to increase and orders are getting larger. There is no question that confidence has been restored to a great extent and buyers have no hesitation in anticipating their wants to a moderate degree. A much better feeling prevails in all circles, unless it is in Shelf Hardware, which is affected by the restriction in building operations.

Pig Iron.—A perceptible improvement is seen in the demand. It is especially noticeable in local Coke. Several contracts for round lots have been placed, indicating some revival in activity. The week has developed more inquiry, and business is particularly good in small orders for quick delivery, showing that consumers' stocks are light. It is believed that such stocks are smaller than ever before. The foundries that have been running for some time on their own Scrap or rejected Castings have about run out of that material, and are now obliged to come into the market for fresh supplies of Pig. The Southern furnace companies report a decided improvement in inquiries from the different localities in which they sell, although in this market the demand for Southern Iron has been somewhat quiet for the past week. A better movement is also observed in Lake Superior Charcoal Iron. The low sales made some time back are not being duplicated, but the furnace companies are getting better prices, and seem to have been able, at least, to get control of the value of their product. Sales of several round lots have been made at prices but a shade under $16. Quotations are now as follows for cash:

Lake Superior Charcoal	$16.00	@	$16.50
Local Coke Foundry, No. 1	13.50	@	14.00
Local Coke Foundry, No. 2	12.75	@	13.00
Local Coke Foundry, No. 3	12.25	@	12.75
Local Scotch	14.00	@	14.50
Ohio Strong Softeners No. 1	15.50	@	16.00
Southern Silvery, No. 1		@	14.50
Southern Silvery, No. 2		@	14.00
Southern Coke, No. 2	12.10	@	12.35
Southern Coke, No. 3	11.35	@	11.60
Southern, No. 1, Soft	12.10	@	12.35
Southern, No. 2, Soft	11.35	@	11.60
Southern Gray Forge	10.85	@	11.10
Tennessee Charcoal, No. 1	16.00	@	16.50
Alabama Car Wheel	18.50	@	18.75
Jackson County Silvery	16.50	@	17.00
Other Ohio Silvery	15.00	@	15.50

Bars.—Better reports are received not only from the local companies, but also from representatives of outside mills; good orders have been placed within the past week, and the demand for small lots is steadily growing. The price of Soft Steel Bars, however, seems to be approaching the price of Iron again, and this is causing consumers to exhibit a preference for Steel when the difference is so slight. Among the sales made last week was one of 200 tons o Refined Iron at the equivalent of 1.55¢ Chicago. Quotations on Common Bar Iron now range from 1.45¢, half extras, Chicago delivery, and manufacturers claim that a good specification is required to secure the inside rate. Soft Steel Bars are selling at 1.47½¢ @ 1.55¢, Chicago. Jobbers continue to be in receipt of good orders from implement manufacturers and also from the smaller class of wagon builders outside of the city. The local wagon makers are buying but little at present, and the prospects in that direction for much business in the near future are not bright. Quotations from stock continue at 1.60¢ @ 1.70¢ on Bar Iron and 1.65¢ @ 1.70¢ for Soft Steel.

Hosted by Google

Structural Material.—More business is in sight in this line than for some time. The Honore Building is a large office building which will shortly be under construction, and will require a great deal of material in the shape of Beams and Columns. It will go to Pittsburgh, however, if the contract has not already been closed. Other business comprises an addition to the Minneapolis City Hall and new viaduct for Milwaukee. The latter will require some 3000 tons of Plates, Angles and other Shapes. A contract for 1000 tons of small Steel Nails was secured last week by a local mill. Quotations are maintained at the following prices on mill shipments, Chicago delivery: Beams, 1.75¢ @ 1.90¢; Tees, 1.95¢ @ 2.05¢; Angles and Universal Plates, 1.75¢ @ 1.80¢.

Plates.—More inquiry is reported in this line, and the prospects for business are much better than they have been. The Bridge works are doing more and are asking prices on good sized lots. The railroads at last are taking more material; also an inquiry in the market for at least 500 tons of Plates for the Pacific Coast. Store trade is not active, as the Boiler shops in this vicinity are doing but little. Prices are lower, as manufacturers are competing vigorously for the orders in sight. Mill shipments, Chicago delivery, are quoted as follows: Tank Steel, 1.62½¢ @ 1 70; Shell Steel, 1.82½¢ @ 1.90¢; Flange Steel, 2.2½¢ @ 2.10¢; Fire Box, 2 75¢ @ 5¢. Store prices now prevail as follows: Iron or Steel Sheets, Nos. 10 to 14, 2.25¢ @ 2.40¢; Tank Steel, 2 10¢ @ 2.20¢; Shell Steel, 2.20¢ @ 2.40¢; Flange Steel, 2.50¢ @ 2.65¢; Boiler Tubes, 70 and 5 % off.

Sheets.—The inquiry for Black Sheets is lighter and some makers are evidently more hungry for business and quote lower prices. The general quotation on mill shipments is 2.75¢, Chicago, for No. 27 Common, but this is shaded by one or two sellers. Small lots from stock are quoted at 3¢. Galvanized Iron is in fair demand and some agents are obliged to buy stock from other houses in order to meet the demand from their consumers. Prices on mill shipments appear to be a little firmer, but quotations on Juniata are continued at 75 % off. Copper Sheets are quoted at 35 % off.

Merchant Steel.—Scattering orders from manufacturing consumers are still being received by mill agents here, which have run to a good aggregate for the week. Consumers are specifying a little better. One large concern reports shipments for October greatly in excess of those for September, showing that business with that house has picked up considerably. Mill shipments, Chicago delivery, are quoted as follows: Smooth Finished Machinery, Tire and Open Hearth Spring Steel at 1.90¢ @ 2¢; Ordinary Bessemer Machinery, 1.60¢ @ 1 65¢; Ordinary Bessemer Tire, 1.55¢ @ 1.60¢; Ordinary Tool Steel, 6¢ @ 7¢; Specials, 12¢ and upward.

Steel Billets.—Sales of round lots of 4 x 4 inch Steel Billets are reported at $19.50 @ $20, Joliet. More inquiries are coming up and it looks as if the Joliet mill would be able to make a fair run, although it will not be pressed to its full capacity.

Rails and Track Supplies.—The only demand for Steel Rails at present seems to come from the Frog and Switch manufacturers. Railroads are buying no Rails to speak of. Some Light Rails are being sold to mills and logging roads. Standard sizes continue to be quoted at $30 @ $32; Light Rails to 30 lb, $31.50 @ $32; 12 lb and upward, $34.50; Iron and Steel Splice Bars, 1.50¢ @ 1.55¢; Track Bolts with Hexagon Nuts, 2.55¢ @ 2.60¢; Spikes, 1.85¢ @ 1.90¢

Old Rails and Car Wheels.—Sales have been made of Old Iron Rails at a shade under the equivalent of $14, Chicago. The railroads have in several instances receded from their former asking price, which was above the market, and are now more willing to meet the views of consumers. A sale of Old Steel Rails, mixed lengths, is reported at $3.35. Long lengths are quoted at $10 @ $10.50. Old Car Wheels are moving to some extent, but the demand seems to be purely speculative, and consumers are buying very little. The speculative lots are taken in when the price made is in the vicinity of $11. Carload lots command anywhere from $13 to $14.

Scrap.—Old Material is in better demand from all classes of consumers. The cheapest kind of material, such as Borings, Turnings, &c., is probably moving most freely, Some low sales have been made by holders desirous of realizing. No. 1 Forge has been sold in this way down to $9, while Fish Plates have been sold at a shade under $12. Dealers' selling prices, net ton, are as follows: No. 1 Forge, $10; No. 1 Mill, $8; Sheet Iron, $4.50; Pipes and Flues, $8; Axles, $16; Horseshoes, $11; Fish Plates, $12; Spikes and Bolts, $10; Cast Borings, $4 50; Wrought Turnings, $6.50; Axle Turnings, $8; Heavy Cast, $9 50; Stove Plate, $7.75; Malleable Cast, $8; Mixed Steel, $7, gross ton; Leaf Steel, $14 50.

Metals.—Carload lots of Lake Copper continue to be quoted at 10⅜¢ and casting brands 9¼¢. Quite a sale of Old Copper was made during the past week for export to Germany. An improvement is noted in the demand for Spelter, which is now quoted at 3 50¢. Lead is a shade weaker and prices are not firm at the nominal quotation of 3.30¢ for large lots and 3.35¢ for carloads.

The statement that 2000 tons of Southern Gray Forge had been sold at $10 ℔ ton, delivered at Cleveland, which was embodied in this report two weeks since, was made on excellent authority. The company reputed to have made the sale, however, deny it emphatically. In a telegram to their agents here, dated the 1st inst., they say: "Deny authoritatively reported Cleveland sales. No foundation whatever in fact." On the 2d they telegraphed again, in reply to an inquiry, "Are short Gray Forge. Do not wish to sell."

Cincinnati.

(By Telegraph.)

Office of *The Iron Age*, Fifth and Main Sts.,
CINCINNATI, November 8, 1893.

There has been little if any improvement in any feature of the Pig Iron trade during the week. There is, it is true, more confidence in the financial situation, but as yet this has not enlarged the demand for Pig Iron in this district to any large extent. There is rather more inquiry for Gray Forge, but the extent of it is greatly exaggerated, while for Foundry Iron the demand is very light and for Car Wheel Iron there is no demand at all. All demands have so far been freely met at previous prices and there are offerings at the same rates to the end of this year, which is as far as the furnaces are disposed to name prices, but it is not improbable that they would accept orders running two months into next year for foundry grades There have been some sales of No. 1 Soft at other points, and it is hoped that the more hopeful financial situation will lead to more trade in the future. The Iron Pipe works here are working on old orders, but are not receiving any important new orders. One hopeful feature in the trade is that shipments of Pig Iron have in many instances been resumed on old contracts. Quotations are as follows:

Foundry.

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke No. 1	15.00 @ 15.25
Lake Superior Coke No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Forge.

Gray Forge	9.75 @ 10.00
Mottled Coke	9.50 @ 9.75

St. Louis.

(By Telegraph.)

Office of *The Iron Age*,
Bank of Commerce Building,
ST. LOUIS, November 8, 1893.

Pig Iron.—The conditions prevailing in our last report are unchanged. Sales are limited to carload quantities and prices are unchanged, although shaded in some extreme cases. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$13.00 @ $13.25
Southern Coke, No. 2 Foundry	11.25 @ 11.50
Southern Coke, No. 3 Foundry	10.50 @ 10.75
Southern Gray Forge	10.25 @ 11.50
Southern Car Wheel	17.25 @ 18.25
Lake Superior Car Wheel	16.50 @ 17.00
Ohio Softeners	16.00 @ 16.50

Bar Iron—Jobbers report a steady trade at 1.75¢ for small lots from store. Mills quote 1.45¢, half extras, f.o.b. cars East St. Louis.

Barb Wire.—The demand continues to improve, and the cut in freight rates to Texas points has increased business from this point very materially. Mills quote Painted at $2 and Galvanized at $2 35. Jobbers ask $2.10 for Painted with the usual advance for Galvanized.

Wire Nails.—The weakening tendency noted in our last report continues to be the feature of this department. Mills quote $1.35 for carload lots to jobbers, and in some cases $1.30 is named. Jobbers ask $1.45 @ $1.55, according to quantity.

Rails and Track Supplies.—The improvement noted in the demand for Track Supplies in our last report continues, with prices practically unchanged. We quote as follows: Splice Bars, 1.65¢ @ 1.70¢; Spikes, 2¢ @ 2.05¢; Bolts, Square Nuts, 2.50¢; with Hexagon Nuts, 2.60¢. Steel Rails are inactive at $30 @ $31. Old Rails are nominally quoted at $14 @ $14 50.

Hosted by Google

Pig Lead.—The movement in Pig Lead is restricted to small lots, which are generally quoted at $3.15 @ $3.20.

Spelter.—This metal is unchanged at $3.30.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., November 7, 1893.

There is little or no change to report, the demand for Iron and Steel being of the same languid character as for several weeks past. Some people claim to see an improvement in the number and character of the inquiries, but, judging from actual sales, there is no confirmation of anything of that kind. Wear and tear is beginning to tell, however, and small orders are somewhat numerous, but the aggregate increase—if there is any—is hardly perceptible. Prices remain at the lowest, and notwithstanding the talk of firm and somewhat higher figures in the West, there is no difficulty in placing orders at as low rates as have been named at any time since the summer months.

Pig Iron.—The demand is a trifle better for some grades and larger lots have been taken, but prices are as low as ever and give no promise of early improvement. It is not the large supply that affects prices, but the extremely light demand, which is probably not more than 35 % to 40 % of what is usually expected at this season. The cutting down in production must eventually bring about an adjustment; but, compared with the demand, the current supply appears to be as large as at any time within the past two or three years. The advance in freights will probably affect prices at some points, and in fact may involve a readjustment all the way through; but at the moment there is plenty of Iron at the lowest of all the low prices heretofore quoted, which for Philadelphia and equivalent points are about as follows:

No. 1 Foundry	$13 75	@	$14.25
No. 2 Foundry	13.00	@	13.25
Standard Gray Forge	12.00	@	12.50
Ordinary Gray Forge	11.50	@	11.75

At interior points, such as York, Harrisburg, &c., about 25¢ less is quoted on Virginia Irons.

Steel Rails.—The market is very dull, with prices weak and drooping. Sales are said to have been made at $25.

Steel Billets.—There is no great demand, but sellers in this market are quoting pretty firm prices—say $20 @ $20.50, delivered. A few small lots have been taken, but there is no demand for anything large, although it is supposed that $19.80, or pretty close to it, could be done on 1000 ton lots for good deliveries and quick settlements. Consumption is comparatively very small, hence the indisposition to bid on large lots.

Finished Material. — The demand shows no improvement, and the most that mills are able to do is to make one week keep up with another. Small orders are fairly numerous, but in the absence of a demand for large lots it is pretty close work to keep more than a few days' work on the books. Some deliveries are still being made on last spring's engagements, and a few good sized orders are in prospect, but after making the best show possible it is quite clear that as yet there is nothing that can be construed as an improvement either in price or demand. Nominal quotations are about as follows, but on large lots considerable reductions are made, varying according to circumstances:

Grooved Skelp, delivered	1.47½¢	@	1.50¢
Best Refined Bars	1.52½¢	@	1.55¢
At interior points	1.40¢	@	1.50¢
Tank Steel	1.60¢	@	1.65¢
Heavy Plates	1.65¢	@	1.70¢
Shell	1.75¢	@	1.85¢
Flange	2.00¢	@	2.20¢

Old Material.—The demand is extremely light, and low as prices are, they seem to have very little attraction to consumers. Nominal prices are about as follows, but it is impossible to give exact figures, as a great deal depends on quantity, terms of settlement, &c.:

No. 1 Wrought Scrap, delivered	$12.00	@	$13.00
Machinery Cast, delivered	10.00	@	11.00
Heavy Steel Scrap, delivered	12.00	@	13.00
Old Iron Rails, delivered	14.00	@	14.50
Old Street Rails, delivered	15.50	@	16.00
Wrought Turnings, delivered	10.00	@	11.00
Cast Borings, delivered	6.00	@	7.00
No. 2 Light Scrap	6.00	@	7.00

Pittsburgh.

(By Mail.)

Office of *The Iron Age*, Hamilton Building, PITTSBURGH, November 7, 1893.

The general situation in the Iron and Steel trades shows continued improvement as far as demand is concerned, and the prospects of most of the mills getting enough work to run to nearly full capacity the balance of the year are very encouraging. Since our report of last week a number of concerns have started up to half capacity or more, some of them having done practically nothing for some months. This is particularly true of the Mahoning Valley, several of the mills there having put their finishing departments on this week after an idleness of more than four months. In the Pittsburgh district all the mills are doing something with one or two exceptions. Some of them are employed to full capacity, while the others are running to only one-half or less. At one plant in this city that finishes about 800 tons of material every 24 hours, all departments are on double turn, and have been since September, with good prospects of this being continued right along. Of course, the demand for Iron and Steel must increase to considerable extent yet before we can expect prices to be favorably affected. However, it would seem that on some lines bottom has about been reached, and any change to come must be in the nature of an advance. Bessemer Pig and Billets have held their own for the past week or ten days, and $11.25 for the former and $17.50 for the latter are being maintained.

Rumors of offers to sell Rails at prices equal to about $22, Pittsburgh, have been current here for the past few days, but have been denied in certain quarters.

Pig Iron.—The increased activity among mills that have been in operation right along, together with the demand for Iron that will come from those that have started up within the past week or ten days, has resulted in more inquiries for Iron, and more sales were closed during the past week than in any one week for some time past. The expected increase in demand has resulted in the starting up of a number of furnaces that have been closed for extended periods. In the Shenango Valley, Sharon of the Sharon Iron Company, Limited, Douglass, under the management of Corrigan, Ives & Co., and Stewart of the Stewart Iron Company, Limited, have all gone in since November 1. Rosena of the Oliver Iron & Steel Company will start in a few days. In the Ohio Valley, Bellaire of the Bellaire Nail Works and one stack of the Riverside Iron Works have also started. In the Pittsburgh district two more Edgar Thomson stacks have gone in, and the last idle stack will be blowing in a few days. While it is somewhat doubtful as to whether it is the best policy to increase production to such an extent just now, at the same time it shows that there is considerable confidence in the future. Inquiries are more plentiful for Gray Forge now, and the market is firm on the basis of $10 50, Pittsburgh. We quote as follows:

Neutral Gray Forge	$10.50	@	$10.75	cash
All-Ore Mill	10.75	@	11.00	"
Bessemer Pig	11.25	@	11.50	"
No. 1 Foundry	12.50	@	13.00	"
No. 2 Foundry	11.50	@	12.00	"

We note three sales of Bessemer, one of 1500 tons and two of 1000 tons each, all for November and December delivery, on the basis of $11.25, Pittsburgh. Also a sale of 1000 tons of Gray Forge for November and December delivery at $10.50, Pittsburgh.

Billets.—The improvement in inquiries for Steel as noted in our report of last week continues, and considerable tonnage has changed hands in the last week. While prices have shown no actual advance the tone of the market is better, and makers are refusing to accept orders that are offered them at prices which, perhaps, two weeks ago, would have been accepted. The increased activity among the mills in the Pittsburgh and the Mahoning Valley districts is, of course, responsible for the better demand for Steel, and in addition to this, the feeling is becoming more general that Billets are as cheap as they will get. All of the Pittsburgh mills are fairly well supplied with orders and the same is true of the Wheeling mills. The market is fairly represented by the quotation of $17.50 @ $17.75 at maker's mill. We note a sale of 1000 tons for November and December delivery at $17 70 at maker's mill and one of 1500 tons at $17.60 at maker's mill for same delivery.

Ferromanganese.—We are advised of a sale of 100 tons for November and December at $53, delivered, equal to $52.50 at maker's mill. This is the lowest price ever touched in this market.

Muck Bars.—The withdrawal from this market of two outside makes of Muck Bars has given a firmer tendency to prices for best grades of city made Bars and we quote them at $21 @ $21.25, delivered at buyer's mill. We note a sale of 1000 tons equal deliveries November and December at $21, delivered, and one of 750 tons at $21.25, same deliveries. An Ohio Valley concern have just closed a contract for 1000 tons of Muck Bars and started up their puddling department on Monday, November 6.

Rails.—It now is openly admitted that the combination price of $29 is being cut right along. It is said that offers have been made to sell at prices equal to about $22 at maker's mill.

Plates. — Business continues very light, with prices ruling about as follows: Tank, 1.40¢ @ 1.45¢; Shell, 1.60¢ @ 1.75¢; Flange, 1.65¢ @ 1.75¢; Fire Box, medium quality, 2.50¢ @ 3¢, best quality, 3 50¢ @ 4¢.

Hosted by Google

Structural Material.—There is a moderate demand confined altogether to small lots. No large orders are looked for now, as the close of the building season is at hand. Prices continue to depend nearly altogether on character of order and terms of payment. For ordinary business the following prices rule: Beams up to 15 inches, 1.50¢ @ 1.60¢; Angles and Universal Plates, 1.60¢ @ 1.65¢; Tees, 1.75¢.

Bars.—There is increased activity among the mills, the volume of business showing steady gains. As announced elsewhere, the Valley mills have arranged a wage scale with the National Union of Finishers, and the finishing departments of several plants were started this week. Prices continue very low, with no prospects of improvement until the demand gets heavier. We quote Steel Bars at 1.30¢ @ 1.35¢, with Bar Iron extras. In the Valley Iron Bars are held at 1.30¢ @ 1.35¢, half extras.

Wire Rods.—There is a fair demand, some of the mills having about enough business to keep them in full operation the balance of this year. The output of Rods during the month of October at the plant of the Pittsburgh Wire Company was the heaviest of any one month in the history of the concern. Prices depend largely upon the size of the order and terms of delivery. We quote at $25.50 @ $25 75 for early delivery. For a good sized order, with favorable terms of payment, our lower quotation would probably be slightly shaded.

Wire Nails.—The demand is fairly active, but prices show no improvement—in fact, have shown a weaker tendency during the past week. The bulk of the orders for trade in the Northwest have been filled, in the expectation that navigation would close about November 1, and for this reason the mills are in much better shape to take care of business being offered by the regular trade. We quote $1.25 in carload lots at mill. For large orders this price has been slightly shaded. There is a moderate volume of business in Cut Nails, but, in sympathy with Wire Nails, prices have shown a weaker tendency. The market is represented by the quotation of $1 at mill with the usual averages. For desirable orders this price has been shaded.

Barb Wire.—The demand is very light, there being practically nothing doing. Prices are weak and irregular, and we quote Four-Point Galvanized at $2.20 in carload lots at mill, with the usual advances for less quantities. The above price would be shaded for a good order placed at this time. Painted is ruling at $1.80 in carload lots. There is a fair demand for Plain Wire and we quote at $1.55 @ $1.60 for Nos. 6 to 9 in carload lots.

Pipes and Tubes.—A meeting of the Wrought Iron Pipe and Tube Manufacturers' Association was held in this city last week. No action of importance was taken, the unsatisfactory condition of the market being the principal topic under discussion. The demand for Pipes and Tubes is extremely light, and prices are low, with no prospect of improvement until the demand has materially increased. None of the mills are being operated full time, while a few plants are entirely closed.

Connellsville Coke.—For the week ending Saturday, October 28, there were 5752 ovens in the Connellsville region in blast, and 11,758 idle, with a total estimated production for the week of 52,585 tons. There was a net gain of active ovens during the above week of 398. The increased activity among blast furnaces is expected to lead to an improved demand for Furnace Coke before long, and it is not believed that Coke makers will agree to make contracts for delivery for the first six months of next year at prices ruling now. We continue to quote Furnace Coke at $1.10 in tons of 2000 lb, f.o.b. cars in Connellsville region. The price of Foundry Coke is being firmly maintained on the basis of $1.50 to dealers and $1 65 to consumers.

On November 1 George Eaton Collins was admitted to partnership in the metal brokerage business heretofore conducted under the name of H. E. Collins & Co, which has been changed to H. E. Collins & Son. The offices of the new concern are located on the third floor of the Bank of Commerce Building, Pittsburgh.

Louisville.

LOUISVILLE, KY., November 6, 1893.

Sales of No. 2 Foundry for delivery during three months have been made at basis of $7.90 at furnace; the transaction was for cash without privilege of giving paper. All sales made recently for delivery running into next year have been on a basis of $8 at furnace for No. 2 Foundry, though furnaces had insisted upon getting 25¢ a ton more, but the competition was such that when the transactions came to be closed almost all were willing to sell at this price. No. 1 Foundry for delivery during six months was sold on a basis of $9, furnace, or a shade less, this being the lowest transaction for this grade made. Buyers in general feel that the market has reached bottom and that it is safe to purchase, and that the experience of finding later on that they could buy for less money than in the past is certainly at an end. We expect to see some confidence in buying from now on. The trade consider that present prices will rule for some time, with 25¢ advance being asked and paid for deliveries running for six months of next year. Car shops are shut down, with no immediate prospect of running. We quote for cash, f.o.b. cars Louisville:

Southern Coke, No. 1 Foundry.	$12.50 @ $13.00
Southern Coke, No. 2 Foundry.	11.25 @ 11.75
Southern Coke, No. 3 Foundry.	10.75 @ 11.00
Southern Charcoal, No. 1 Foundry	15.00 @ 16.00
Southern Car Wheel	17.50 @ 17.75
Spathite	12.00 @ 12.50

New York.

Office of *The Iron Age*, 96-102 Reade street,
NEW YORK, November 8, 1893.

Pig Iron.—There has been no increase in the demand for Pig Iron in this and tributary markets. We quote: Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2; $12.25 @ $12.50 for Gray Forge, at tidewater. Southern Iron, same delivery, $13 @ $14 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft. Gray Forge is $11.25 @ $12.

Spiegeleisen and Ferromanganese.—Western reports indicate such low prices for domestic Ferromanganese that it must now be able to penetrate far Eastward. We quote: Foreign Spiegeleisen, nominally, for 10 % @ 12 %, $21.50 @ $22, and 20 %, $25.50 @ $26, on cars, Jersey City, and Ferromanganese, $55 50 @ $56.

Billets and Rods.—No new business of any consequence is reported. We quote nominally: Domestic Billets, $20.25 @ $22.50, and foreign Billets, $28 @ $28.50, tidewater; domestic Wire Rods, $28.25 @ $29, and foreign Rods, $39.50 @ $40, tidewater.

Steel Rails.—Prices on Steel Rails are now openly cut by the Rail mills and an eager canvass for orders is being made. The Pittsburgh mill is making great efforts to capture trade in the territory of the Eastern mills, but is being met by them. Some business has been done and more is pending. It is fair to quote $24 @ $25 at tidewater. There is a good deal of excitement and much uncertainty in the Rail trade. The sharp drop in the price is expected to bring out buyers as soon as they realize that values have gone down to the lowest point attainable. The fact that conservative and cautious buyers have already taken hold is proof of the fact that the heavy reduction has tempted them. It may be questioned whether even at the prices now openly quoted all the mills will continue to meet the market, and even those who do will probably be chary about taking too many orders.

Track Material.—Some business has been done at low prices: Small lots are selling at the following prices: Spikes, 1.80¢ @ 1.90¢; Fish Plates, 1.40¢ @ 1.60¢; Track Bolts, Square Nuts, 2.25¢ @ 2.40¢, and Hexagon Nuts, 2.40¢ @ 2.50¢, delivered. Concessions would be made for round lots.

Manufactured Iron and Steel.—There have been closed and there are pending for early settlement contracts for three large buildings in this city which will call for close upon 4000 tons of Structural Material. There are indications that work delayed earlier in the season is now being taken up. We quote nominally: Beams up to 15 inch, 1.70¢ @ 2¢; 20-inch, 2¢ @ 2.25¢, for round lots; Angles, 1.75¢ @ 1.90¢; Universal Mill Plates, 1.65¢ @ 1.90¢; Tees, 2¢ @ 2.15¢; Channels, 1.70¢ @ 2¢, on dock. Steel Plates are 1.60¢ @ 1.70¢ for Tank; 1.75¢ @ 1.90¢ for Shell; 2¢ @ 2.15¢ for Flange, and 2.50¢ @ 2.80¢ for Fire Box, on dock; Refined Bars are 1.50¢ @ 1.9¢, on dock, and Common, 1.40¢ @ 1.50¢; Soft Steel Bars are 1.50¢ @ 1.70¢; Scrap Axles are quotable at 1.70¢ @ 2¢, delivered; Steel Axles, 1.70¢ @ 1.90¢, and Links and Pins, 1.70¢ @ 1.80¢; Steel Hoops, 1.75¢ @ 1.90¢, delivered; Cotton Ties, 70¢ @ 72½¢ ₩ 45 lb bundle, at mill.

Old Material.—Old Iron Rails are nominally at $13 @ $14; Old Steel Rails, $8 @ $9, and Wrought Scrap $9 @ $11.

Stock Warrants.—The American Pig Iron Storage Warrant Company report as follows:

	Tons.
Stock in yard September 30, 1893	77,700
Put in yard for 31 days ending October 31, 1893	1,700
Total	79,400
Withdrawn 31 days ending October 31, 1893	2,300
Net stock in yard October 31, 1893	77,100

The firm of Cudlipp & Hollister, Pig Iron merchants, 15 Cortlandt street, have been dissolved by mutual consent. The obligations of the firm are being discharged as rapidly as possible. J. R. Cudlipp will continue a commission business in Pig Iron, Coke and Metals at the same address.

Hosted by Google

Markt & Co., Limited, agents for Eicken & Co.'s Tool Steel, have received a stock of that Steel, which, for want of room, is stored in the warehouse of Chas. E. Ring, near Roosevelt Ferry, Brooklyn. They quote No. 8 Steel, which is used for turning and finishing the hardest stock, at 30¢.

Financial.

No specially notable features have developed in the financial situation during the past week. The status of things in the money and stock markets has changed but little from that presented in our last report, and the general business condition of the country, although showing a distinctly better feeling in most quarters, has displayed as yet no remarkable revival of activity. The general interest felt in the elections in many parts of the country—and particularly in New York—may partially account for the tameness in speculation and industrial enterprise. This, however, is probably but the natural reactive effect after the strain of suspense and uncertainty had been removed by the passage of the Silver Purchase Repeal bill last week. To those optimists who looked for a marked and immediate revival of business and enterprise, the comparative dullness following on the heels of repeal must be a disappointment. But to those who took a more farsighted view of the effects of the Senate's action, the present condition is only a natural one. That action had been discounted by Wall street ten days before the event, and the extraordinary upward rush of values in the stock market which then took place was followed by a perfectly natural reflux of prices to a more reasonable level, the ebb tide having continued down to the present. Confidence, too, is a quality that is far slower in returning than people generally understand, and until its fuller restoration is effected no remarkable revival of activity can be expected.

The gradual restoration of monetary affairs to a normal condition is, however, surely taking place as an effect of the recent currency legislation. Business men see this, and unless the dread of another upset by radical tariff changes serves to repress enterprise and check trade to any serious extent this winter, a gradual, and therefore more permanent, revival of business on a sound basis is among the things confidently looked for. The bank reserves are larger than for years past, and these institutions, as well as trust and insurance corporations, are anxious to place their surplus funds at low rates of interest. This favorable condition is not likely to be long neglected by those requiring such accommodation. In any case it is conceded that the settlement of the much-vexed silver question, while it has not prevented a decline in prices, is destined to exert a favorable influence on the business interests of the country in the near future.

The final cancellation of the New York Clearing House loan certificates was followed on Saturday by the resumption of the weekly bank statement in detail for the first time for five months. It shows that a considerable number of the banks are carrying extraordinarily large reserves, some as high as 50 % and 60 %. The gain in surplus reserves during the week was $3,225,975. The banks now hold $52,000,000 above the legal requirement, as against $2,700,000 at the same time a year ago and $7,000,000 in 1891. The most striking feature disclosed by the statement is, however, that the great accumulation of money is not, as was supposed, held by the banks that have been doing most of the country business, but by those that have the deposits of trust companies and similar institutions. The obvious inference from this fact is that hoarders have at last been constrained to bring out their funds and put them in deposit. The following table shows the bank changes as compared with last week:

	October 28.	November 4.	Differences.
Loans...	$397,324,800	$402,383,300	Inc..$5,058,500
Specie...	96,564,500	97,116,500	Dec. 552,000
Legal tend..	60,538,400	66,750,100	Inc.. 6,211,700
Net deposits.	433,261,700	447,412,600	Inc. 14,150,900
Circulation...	14,610,800	14,409,900	Dec. 200,900

No further orders for gold for import have been reported during the week, but exchange has been hovering around the importing point, and it is the general impression, both here and in Europe, that a resumption of gold imports to this country is imminent. In regard to this the London *Economist*, in a recent article, expressed itself as follows: "It is practically certain that considerable shipments of gold will have to be made to the United States, and it is the Bank of England's stock of the metal that will first be drawn upon. That is now fairly large, amounting to close upon £26,600,000, which is about £1,600,000 more than was held at this time last year, while the reserve is £1,900,000 greater than it then was."

The present situation of this country in respect of the gold movement is shown by the following figures:

Exports of gold from January 1, 1893, to date...	$70,159,547
Imports for the same period.....	59,074,3»5
Net exports.....	$11,085,152

On the Stock Exchange the market has been almost wholly a "traders'," one; the "bears" being usually in the ascendant, and succeeding in forcing down a number of the active stocks—particularly certain industrials—materially below the prices of last week. Friday and Saturday showed dull trading with a declining tendency in prices; although the more favorable returns of St. Paul, Rock Island and other railroads promulgated at the end of the week strengthened the position of those issues, and at the close of the week they were firm and higher. Monday's dealings on the exchange were small, and the fluctuations relatively insignificant; except in the case of Sugar and Chicago Gas stocks, which yielded to determined bear attacks, closing at a decline of several points. The main business was, however, in clearing up prior to Tuesday, on which day the exchanges and other business institutions were closed. Altogether the week's market has been confined within purely professional limits, with very little public interest in evidence. The extreme fluctuations of some of the more active stocks during the week are shown in the following list, together with the closing prices on November 8:

	Highest.	Lowest.	Closing, Nov. 8.
Am. Sugar Ref.....	102⅓	94⅞	100¼
Atchison, T. & S. Fé....	21¾	19⅝	20
Balt. & Ohio.....	75⅝	72	72
Chicago Gas.....	68	58¼	61⅜
Chic., B. & Q.....	83¾	81⅛	82⅜
Chic., Mil. & St. Paul...	66⅛	63⅝	65¾
Chic., Rock Isl. & Pac..	69¾	66⅛	68
Del. & Hudson.....	132¼	129½	132¼
Del., Lack & Western...	175	171	173
Gen. Electric.....	48	43⅝	45¾
Lake Shore.....	129¾	126⅛	129
Louisville & Nashville...	50¼	47⅛	49⅛
Manhattan.....	133¾	130⅓	133¼
Missouri Pacific.....	27½	24¼	25
Minnesota Iron, asked...	....	....	50
National Lead, Common.	28¼	26½	28
New Jersey Central.....	119	116½	119
New York Central.....	103⅝	102¾	103½
N. Y., L. E. & Western.	14⅜	14¼	14⅜
Northern Pacific, Pfd. .	23¼	21⅞	22
Philadelphia & Reading..	21⅞	19⅝	20⅞
Richmond & West Pt., Terml.....	3¾	3¼	3¼
St. Paul & Omaha.....	39⅛	37	38
Union Pacific.....	18¾	17¼	18
Western Union.....	90⅜	86½	88¾

Government bonds have been strong and steady. The last sales on call were $5000 4s, registered, at 112½; $11,000 do., at 112⅛, and $1000 4s, coupon, at 112½. The closing quotations were as follows:

	Bid.	Asked.
2s, 1891, registered.....	96	.....
4s, registered.....	112	113
4s, coupon.....	112	113

Railway and miscellaneous bonds, while fairly active, have been irregular and weaker, there being a considerable contraction in the issues in which trading was done. Prices have also declined in most lines.

Money on call is offered in abundance at 1½ % @ 2 %, the offerings by private bankers being ample to meet the demand. The demand for time loans continues light, and the supply abundant, the market being free from discrimination as to the character of collateral accepted. The usual quotations for time loans are 3 % @ 3½ % for 60 and 90 days; 4 % for four months, and 4 % @ 5 % for longer terms. Mercantile paper of good quality is being readily bought by both city and country banks, the rates being generally 5 % for double name and 5½ % @ 6 % for single name.

The market for sterling exchange rules firmer, a rise of a fraction having taken place at the close of last week on a sudden demand for bills from importers. The advance was maintained early in this week, owing to a light supply of commercial bills and more demand against sales of securities for foreign account. Actual business was done at the close at $4 81½ @ $4.81¾ for 60 days; $4.84 @ $4.84¼ for demand; $4.84¼ for cables, and $4.80⅛ for commercial. Domestic exchange on New York is quoted as follows: New Orleans, commercial 200 discount, bank 31; Charleston, buying ⅛ discount, selling par; San Francisco, sight 12½, telegraph 17½ premium; Savannah, buying ¼ discount, selling ⅛ discount @ par; Chicago, 75 @ 80 premium; St. Louis, 75 premium.

Silver is higher, the price for refined bars having advanced to 32⅜ pence ℔ ounce in London, and 70¾¢ ℔ ounce in New York. Some considerable shipments of silver have been made during the week, and the outlook promises a revival of trade in the metal instead of the reverse, as a sequel to the passing of repeal bill.

Metal Market.

Copper.—There have been additional purchases of fair sized lots of Lake Superior Ingot for prompt and near future delivery, chiefly by home consumers. At least 500,000 ℔ were involved. The prices ranged from 9¾¢ up to 10¢, according to delivery and other contract specifications. Some improvement has been noted also in sales of other varieties that led stiff holding at 9⅜¢ @ 9½¢ for Electrolytic and 9½¢ @ 9⅝¢ for casting stock. Meanwhile export movement on old contracts has continued liberal, while the output from the mines is still under more or less restraint, making in all a condition of affairs that

Hosted by Google

serves to give the market greater tone of firmness for the time being at least. There is hardly any speculative interest, and legitimate trade movement seems to be the foundation of the turn for the better that has taken place since the beginning of the month.

Pig Tin.—The market has recovered slightly from the depression more or less conspicuous during the period covered by last week's review. Prompt and current month deliveries now command about 20.60¢ and the offering is somewhat reserved. Comparatively few speculative transactions have been reported and purchases by jobbers and consumers have not exceeded the average volume. Still the amount of stock in first hands continues to steadily diminish and the statistical position here is stronger to that extent. A partial offset exists in the fact that European stocks are being largely increased and that prices in the foreign markets are gradually receding to the parity of local market quotations. The visible supply in Europe and America is estimated at about 15,000 tons, or nearly the same as the quantity recorded for the corresponding period last year, including 3700 tons in America, exclusive of Pacific Coast, and 700 tons afloat.

Pig Lead.—Speculative interest in this metal has been on the wane, and consumers have purchased in a very indifferent manner. Sellers have not offered in a manner indicative of unusual pressure to secure orders, but the supply on offer seems to be in excess of the outlet and prices are correspondingly easier. Common domestic was freely offered at 3.35¢ in round lots toward the close of the week, while bids of over 3.30¢ for deliveries this month or next were exceedingly few. In fact, there were some sellers at the latter price.

Spelter.—Little if any change has taken place. The popular quotations are 3.60¢ @ 3.65¢ for ordinary Western brands, with about the usual premium for special or fancy brands. Business has been slow here, individual transactions involving more than single carloads being the exception. The demand is exceedingly tame at this writing.

Tin Plates.—Fairly large orders have been placed for 100-lb. Bessemer Steel Cokes, March and April delivery, at about $4.90, landed here. Otherwise the interest in futures continues tame. Spot business continues uneven, but importations are fairly well absorbed, and dealers secure about former prices for most varieties. Spot quotations are as follows: Coke Tins—Penlan grade, IC, 14 x 20, $5.35; J. B. grade, do., $5.40; Bessemer full weight, $5.35 @ $5.40; light weights, $4.95 @ $5 for 100 lb, $4.85 for 95 lb, $4.70 @ $4.75 for 90 lb. Siemens Steel scarce. Stamping Plates—Bessemer Steel, Coke finish, IC basis, $5.60; Siemens Steel, IC basis, $5.65; IX basis, $6.75 @ $7. Charcoals—Melyn grade, IC, $6.37½ @ $6.50; Crosses, $8; Allaway grade, IC, $5.60; Crosses, $6.75; Grange grade, IC, $5.75; Crosses, $6.85. Charcoal Ternes—Worcester, 14 x 20, scarce; do., 20 x 28, $11.35; M. F., 14 x 20, $7.75; do., 20 x 28, $15; Dean grade, 14 x 20, $5.30 @ $5.37½; do., 20 x 28, $10.50 @ $10.60; D. R. D. grade, 14 x 20, $5.15; do., 20 x 28, $10.10; Alyn, 14 x 20, $5.32½ @ $5.35; do., 20 x 28, $10.40; Wasters—S. T. P. grade, 14 x 20, $4.75; do., 20 x 28, $9; Abercarne grade, 14 x 20, $4.60; do., 20 x 28, $8.87½.

British Iron and Metal Markets.

[*Special Cable Dispatch to The Iron Age.*]

LONDON, WEDNESDAY, November 8, 1893.

The market for Pig Tin has been dull, and prices have moved somewhat irregular, in sympathy with the fluctuations in silver. At a slight advance established there was free selling, under which prices dropped, since buying orders were on a very limited scale. Prompt delivery was sold at as low as £76. 10/, and futures at proportionate figures. At the close the market was soft, with £77. 10/ @ £77. 12/6 quoted for prompts, and £77. 5/ @ £77. 7/6 for futures.

Copper improved somewhat from the lowest point reached last week, with £42. 10/ reached for Merchant Bars for prompt delivery. Subsequently there was a reaction to £42. 3/9, despite the repeal of the Sherman Silver bill and more favorable reports from the American market. Realization of profits by speculators has held in check a better turn in prices. Purchases by consumers have been good. European stocks increased 286 tons last month and the visible supply shows a gain of 136 tons. Chili charters the last fortnight were about 1000 tons. Sales of furnace material latterly have been moderate. Among others were 200 tons Montana Matte at 9/.

The Tin Plate market is without decided change. Prices are steady. There is a very fair home trade demand, also some export inquiry for futures. The latter was chiefly for oil sizes at 11/, f o.b. Swansea, but some sales were made of ordinary Cokes at relatively better price. Exports last month amounted to 27,000 tons, against 31,000 tons in October, 1892. Shipments to the United States were 13,000 and 19,000 tons respectively. Liverpool quotations were as follows:

IC Charcoal, Alloway grade	12/6 @ 13/
IC Bessemer Steel, Coke finish	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12/
IC Coke, B. V. grade, 14 x 20	11/6 @ 11/9
Charcoal Terne, Dean grade	11/3 @ 11/6

Pig Lead has met with slow sale, but the market is firmer at £9. 15/ for Soft Spanish.

Spelter has been in only moderate request, but sellers are firmer and now asking £17 for ordinary Silesian.

All branches of the Iron and Steel market is dull and prices lean more or less in buyers' favor. Exports of Pig Iron last month were 89,000 tons, against 92,000 tons in October, 1892. Last dealings in warrants were at 42/4 for Scotch, 34/4½ for Cleveland, and 44/4½ for Hematite.

The Valley Scale Settlement.

Last week several conferences were held in Youngstown between a committee representing the National Union of Finishers and a number of the Valley mill owners, with the result that a wage scale governing the finishing departments of the Valley and other Western Ohio mills was agreed upon, and has been signed by the Mahoning Valley Iron Company, the Andrews Brothers Company and the Union Iron & Steel Company. The terms of this scale have not been made public, but it is announced that its provisions are mutually satisfactory to both employer and employee. Enough is known concerning it, however, to warrant the statement that it differs essentially from the scales heretofore made by the Amalgamated Association, and shows conclusively that the new labor organization referred to above has started out with the determination to accord fair treatment to the manufacturers who will agree to recognize it. In the first place the scale is based on a 1½-cent card rate, while the Amalgamated Association scale is based on a 2-cent rate, having recently been changed back from a 1½ cent basis to a 2-cent basis. The wisdom and necessity of this change is at once apparent to those who have watched the steady decline in the selling price of iron and steel bars, until 1.35 cent at mill is the outside figure now attainable. While it is possible that the price of bars, owing to heavy demand or other unusual conditions, may advance to 1.50 cent, it is not thought that 2 cents will ever again be reached. The scale also calls for material reductions in wages, which were also necessary before the Valley mills could see their way clear to start up and compete with the non-union mills in the Pittsburgh district. But perhaps the most important change of all lies in the fact that the scale is a perpetual one, and is in force so long as notice is not given by either side of a desire to change it, and its provisions require that three months' notice must be given before the terms of the scale can be changed. This is a point that manufacturers in Pittsburgh and elsewhere have been striving for years to have the Amalgamated Association concede to them, but which has persistently been refused. It was the real cause of the disastrous Homestead strike in July, 1892, as the Amalgamated Association conceded everything asked by the Carnegie Steel Company, Limited, but refused to allow the scale to be a perpetual one, insisting that it must expire in June to conform with the time of expiration of other Amalgamated Association scales. Another important feature of the scale lies in the fact that every employee whose wages are fixed by it must attach his signature to it if desired by his employers. This virtually makes it a personal contract between the firm and each of its employees, and will reduce to a minimum the chances of a strike taking place should disagreements arise at any time. Other changes of a minor character have been made in the scale, some of which were suggested by the mill owners and others by the employees. The fact that the Valley mill owners accept and sign a scale largely prepared by representatives of the National Union of Finishers certainly speaks well for the business methods employed by that organization, and will aid it considerably in obtaining recognition from other manufacturers. As no puddlers belong to this organization the price to be paid for boiling is yet unsettled, but it is understood that the Valley mill owners have fixed $4 50 per ton as the price they are willing to pay for this class of labor. If the puddlers belonging to the Amalgamated Association do not agree to accept this price, it is likely the puddling departments will remain idle, or else muck bars will be bought in the open market. By reason of the low cost of billets some concerns will use largely of these, and as a consequence the amount of puddling done in the Valley from now on will be somewhat less than in the past. The completion of the Bessemer plant of the Ohio Steel Company, in which some of the Valley mill owners are interested, will also result in an increased use of billets and a corresponding displacement of puddling. The acceptance of the scale of the National Union of Finishers will further weaken the Amalgamated Association and will undoubtedly hasten the final disruption of that once powerful labor organization.

HARDWARE.

Condition of Trade.

NOVEMBER opens with some indications of improvement, although the volume of business is not, on the whole, materially increased. A goodly number of small orders have been coming in to merchants' and manufacturers' representatives in this market, indicating something of a quickening in the demand and a disposition on the part of the trade, especially of the retail trade, to purchase a little more freely. The advance of the season, however, has its effect in restraining trade. As usual at this time of the year, there is more or less falling off in the volume of business. It is evident that stocks in the hands of retailers are unusually limited, the character of the orders showing that assortments are pretty well depleted. The policy which has been pursued for the past few months of limiting purchases to such goods as are absolutely required is still adhered to, and a very conservative spirit dominates the whole conduct of business. While the effect of this is to curtail trade for the present, it is unquestionable that this is the safest and wisest course, and tends to put business on a solid basis, averting serious disaster and laying the foundation for future prosperity.

Chicago.

(*By Telegraph.*)

No improvement is perceptible in the Shelf Hardware trade. Perhaps in a few departments there may be some little increase in the volume of business, but the aggregate shows a decline rather than an increase. If trade continues in this way during the month of November the volume of business will be considerably under that of October. The decline is not attributed so much to lack of demand, however, as to hesitation in extending credits. Jobbers state that opportunities are offered them to sell considerable quantities of goods to new customers or to parties whose financial standing is not of the best. The better class of merchants, whose credit is high, buy quite sparingly and are very conservative. The demand for Tin Plate and tinners' stock is much better than it has been, but the improvement is not enough to make merchants feel elated over the change. It is simply a movement in the right direction, which they welcome. Jobbers of Heavy Hardware are still in receipt of good business from consumers of Iron and Steel, like the Implement manufacturers, and also report a little better demand from out of town wagon builders. City trade is quiet.

St. Louis.

(*By Telegraph.*)

The backward weather has had a depressing effect on the demand for Hardware, especially so far as cold weather goods are concerned. The demand for shelf goods continues to keep improving, but yet fails to reach the corresponding period of last year. Retail dealers continue to buy sparingly and as a result their stocks are lower than ever before, and any improvement in the demand would compel them to enter the market as buyers. Firearms and Ammunition continue in good demand. Credits are still closely scrutinized, but there is a disposition to be more liberal in this direction. It is generally conceded that November and December will be quiet months, but a heavy increase is anticipated after the turn of the year.

Notes on Prices.

Wire Nails.—The Wire Nail market continues in substantially the same condition as last week. It is represented by the quotation of $1.20 to $1.25 for carload lots at mill, the former figure being obtainable on good orders. There has been a fair demand and most of the mills are well occupied.

Chicago, by Telegraph.—Manufacturers of Wire Nails report business as keeping up about the same as it has been for the past week or two. They are quoting $1.32½ here for factory lots, but this is now the price for ordinary lots to which the general market has settled. Small lots from stock have receded to $1.45 on account of the lower prices from factory.

Cut Nails.—There is only a moderate inquiry for Cut Nails and the market does not show an increase of strength in price, quotations being on a basis of 95 cents to $1 for carload lots at mill. Concessions are made in special cases. The New York price for small lots from store is $1.20 to $1.25.

Chicago by Telegraph.—A better inquiry and more sales than the previous week is the report received from manufacturers of Cut Steel Nails. Low freights to the Southwest are having an important influence on their business at present. Some quite large lots are under negotiation. Prices are still quoted at $1.20 to $1.25, Chicago, for factory lots, while small lots from stock are unchanged at $1.30.

Barb Wire.—There are indications of a slight increase in the volume of business in Barb Wire, but trade is on the whole sluggish and unsatisfactory. Quotations continue on the basis of $2.15 for carload lots of Four-Point Galvanized at mill, but this price has been shaded. Manufacturers are solicitous to obtain orders and as a result quotations are somewhat uneven.

Chicago, by Telegraph.—The Barb Wire trade has picked up to some extent, although the demand is considerably less than manufacturers would like to experience at this time of the year. A better outlook is now offered for trade with the Southwest, owing to the low freight rates. This is having its effect on trade, as it comes in addition to the better impulse in the West and Northwest. Prices continue as before on a basis of $2.40, Chicago, for Galvanized in carload lots, and $2.55 for small lots from stock. The demand for Plain Wire has increased rapidly within the past two weeks. Manufacturing establishments consuming Wire have started up quite generally, and some of them are running to their usual capacity in ordinary times. The manufacturers of Mattresses are particularly prominent in this better condition of business, but the implement makers and others who consume Wire to considerable extent are also more inclined to buy than for several months, and are placing good contracts with the manufacturers.

Powder.—LAFLIN & RAND POWDER COMPANY, 29 Murray street, New York, issue under date November 1 revised prices for Gunpowder, which are subject to a discount of 2 per cent. for cash in ten days:

Keg Powder.

	In Kegs. Pounds.	
Orange Rifle, extra	25	$3.25
" " "	12½	1.90
" " "	6¼	1.10
Orange Special	25	4.25
" "	12½	2.40
" "	6¼	1.35
Creedmoor	6¼	1.10
Orange Ducking (Gold Band)	6¼	2.25
Blasting and Mining (B)	25	1.50
" " " (A)	25	2.00

Canister Powder.

	In Canisters. Pounds.	
Orange Lighting	1	$0.75
Orange Ducking	1	.45
Orange Rifle, extra	1	.25
" " "	½	.15
" " "	¼	.12

It will be observed that the above list shows a reduction in price of Rifle Powder in canisters and of Lightning and Ducking Powder. On Rifle and all Sporting Powder in lots of 1000

Hosted by Google

pounds or over, one sale, one shipment and to one consignee, a discount of 10 per cent. will be allowed. In less quantity there is no discount. The prices of Blasting and Mining Powder as quoted are net.

THE HAZARD POWDER COMPANY, 63 Pine street, New York, under date November 1, in issuing their revised price-list refer to the fact that it shows a large reduction in all the Sporting Powders, especially in the finer grades —namely, Electric and Duck Shooting —and also in canisters of Kentucky and Indian Rifle, to which they direct particular attention, and express the hope that this reduction will lead to increased consumption of the higher class of Powders. Their revised list is as follows, which on Rifle and Sporting Powder in lots of 1000 pounds and over, one sale, one shipment and to one consignee, is subject to a discount of 10 per cent., and on all bills paid within ten days a discount of 2 per cent. will be allowed:

Canister Powder.

	Pounds.	Each.
Electric, Nos. 1, 2, 3, 4, 5, 6 and 7 grain, square canisters of	1	$0.75
Duck Shooting, Nos. 1, 2, 3, 4, 5 and 6 grain, in oval canisters of	1	.45
Duck Shooting, Nos. 1, 2, 3, 4, 5 and 6 grain, in oval canisters of	½	.30
Kentucky Rifle, FFFg, FFg and Sea Shooting Fg, in oval canisters of	1	.25
Kentucky Rifle, FFFg, FFg and Sea Shooting Fg, in oval canisters of	½	.15
Kentucky Rifle, FFFg, FFg and Sea Shooting Fg, in oval canisters of	¼	.12

Keg Powder.

	In kegs. Pounds.	
Duck Shooting, Nos. 1, 2, 3, 4, 5 and 6 grain	25	$8.00
Duck Shooting, Nos. 1, 2, 3, 4, 5 and 6 grain	12½	4.25
Duck Shooting, Nos. 1, 2, 3, 4, 5 and 6 grain	6¼	2.25
Kentucky Rifle, FFFG, FFG and Sea Shooting Fg	25	3.25
